Buoyed by the initial success of the Technology Mission, pulses were also brought into the ambit in 1990. The objective of the Mission was expanded to increase the production and productivity of oilseeds and pulses and to make the country self reliant in these vital sectors. The total outlay of Ninth Plan for Oilseeds (OPP) and Pulses (NPDP) production programmes was Rs. 498 crore and Rs. 181 crore respectively. This went upto Rs. 540 crore and Rs. 215 crore for the Tenth Plan.

4.2.10 The pattern of assistance under Centrally Sponsored Integrated Scheme of Oilseeds, Pulses, Oil Palm and Maize (ISOPOM) is on 75:25 sharing basis between Govt. of India and State Govts. in all components except infrastructure development and publicity. Under infrastructure development, the pattern of assistance is 50:50 sharing basis whereas for publicity, 100% assistance is provided by GOI on lump sum basis (Rs. 2.00 lakhs for each State).

4.2.11 Following production constraints were noted in oilseeds and pulses

4.2.11.1 Oilseeds

(i) Low productivity primarily due to their cultivation in un-irrigated drought prone areas.

(ii) Highly risky crop affected by vagaries of nature like floods and drought in Kharif and frost in Rabi.

(iii) Susceptibility to a number of pests and diseases, which lower productivity.

(iv) Use of poor quality seeds by the farmers and their reluctance to provide cash inputs as growing of oilseeds was risky.

(v) Distress sale of oilseeds during the harvest period where marketing channel was weak.

(vi) Lack of high-yielding varieties suitable to the local agro-climatic regions.

(vii) Non-availability of hybrids in Mustard, Groundnut, Sesamum, Soybean, Niger and pests and disease resistant varieties.

4.2.11.2 Pulses

(i) Cultivation of pulses was less remunerative than that of cereals such as rice, wheat, and oilseeds or of other commercial crops. The farmers, therefore, diverted the better lands and resources for the cultivation of other crops.

(ii) Pulses were raised under rainfed condition on marginal and sub-marginal lands, which were poor in fertility with minimal input application.

(iii) The varieties available were susceptible to a number of diseases like yellow mosaic virus and powdery mildew in moong, urd and cowpea, sterility mosaic in arhar, wilt and blight in gram, reducing the yield; they were also vulnerable to termites and susceptible to pests.

(iv) No major break-through had been achieved in pulses production technology and improvement of high yielding germ plasm. The varieties evolved in pulses had narrow adaptability and, therefore, the farmer had to manage within the limited range of varieties for different seasons and agro-climatic situations.

(v) The production of pulses especially in summer/kharif season was affected by stray cattle and Blue Bull, which damaged pulse crops such as arhar, moong and urd more than any other crops.
(vi) Lack of proper marketing infrastructure and highly fluctuating prices led to uncertainty in economic returns.

(vii) Inadequate seed availability (about 2-5% seed replacement rates)

(viii) Inadequate transfer of technology programmes.

(ix) Poor storage facilities

4.2.12 The following suggestions for improving the relationship between financial outlay and output in terms of production, productivity and quality of produce can be made

(i) Timely administrative approval for implementation of the schemes.

(ii) Funds should be released directly to implementing agencies;

(iii) Timely issue of State Level Sanctions/release of funds by the State Govts. for the programme

(iv) Arrangements of inputs, well in time by the implementing agencies under the programme.

(v) Close monitoring of the implementation of the programme activities;

(vi) Review of programme on quarterly basis;

(vii) Advance planning for inputs, particularly for seed. 5-6 years rolling plan for seed, variety/hybrids, season-wise and year-wise, agro-climatic zone wise, should be prepared by the State;

(viii) More involvement of good private sector in input supply and extension activities as provision has been made in ISOPOM guidelines;

(ix) Use of maize for production of ethanol for its further use as fuel

(x) Encouraging primary processing facilities, rural godowns, marketing infrastructure etc. in rural areas.

(xi) Involvement of farmers associations/groups/societies in implementation of the programmes/activities;

(xii) Hiring of locally available, agriculture graduates/post graduates/doctorates at various levels, viz; grass root level, district level, States level, and national level, on contract basis.

(xiii) Setting up of maize processing industries used on dry maize processing at district level;

(xiv) Encouraging the production of speciality maize like QPM, Baby Corn, Sweet Corn, Pop Corn etc.;
4.2.13 Analysis

4.2.13.1 The substantial achievements of the TMOP were made possible not only by the political commitment and zeal at all levels but by a very favourable minimum support prices regime till 1994. The tide however, started turning in 1994-95 due to the changes in the Government. The sharp monitoring petered off after the departure of Shri Sam Pitroda. At the same time, voice of urban consumers for cheap edible oil became vociferous and international edible oil prices also registered a fall. The Government liberalized of import and put edible oil under Open General License (OGL). Even more importantly, and unfortunately, the bound rate for crude and refined soybean came down to 45 per cent whereas the bound rate for mustard and all other oils came to 75 per cent and 300 per cent. This was a death knell for the concept of self-sufficiency in edible oils. It also discouraged the oilseeds farmers within the country so much so that the production and area have tapered off ever since in sharp contrast to the impressive gains in the first ten years of the Mission. Briefly, therefore, the demands of the urban consumers and the interest of oilseeds producing farmers worked at cross-purpose and the trade policy negated the benefits of the Technology Mission on Oilseeds. While it can be argued that the policy move towards imports of edible oilseeds under Open General License was a component of the trade liberalization set in motion in 1991 for commodities across the board and that it was perhaps not possible to resist international pressure on reduction of bound rate for imports, it must be said that if the trade policy had to be adopted as a component of the country’s foreign and economic policy, the Technology Mission should have been wound up at that stage itself without having to be continued till 2002 and be blamed for failing to achieve its objective, in the last years.

4.2.13.2 India is now amongst the largest importers of edible oils in the world today. There is a significant co-relation between the trade policy, minimum support price and self-sufficiency in oilseeds. The reduction in import duty to 50 per cent in 2002-03 led to one of the lowest level of production of 155.7 lakh tonnes, thereby negating the gains of the Technology Mission since its inception. The percentage of self-sufficiency of around 95 percent during 1990-91 and 1992-93 came down to only 50 percent during 2002-03. While per-capita availability of edible oils has increased because of increased availability of imported oil, it has very severely affected the
production of oilseeds and edible oil within the country and correspondingly it has meant substantial decrease in the income of farmers through production of oilseeds.

4.2.13.3 After the initial success, several other problems also cropped up. Even though several posts were specifically created for the Mission, many of these remained unfilled. The posts were filled on the basis of administrative convenience rather than on specific suitability of the concerned officials. The situation was replicated in the States where the reduced priority/ fervour for the Technology Mission in the Centre was felt. Consequently the Technology Mission became another division of the DAC with its own problems of vacant posts and inappropriate staff.

4.2.13.4 Compounding the problems further, the various officers in the Technology Mission were burdened with responsibilities for many other crops also in view of overall constraints on the staff of the department. This also led to a reduced focus on the activities of the Mission and oilseeds became one of the several crops of crops in the overall umbrella of the Crops Division of the DAC. The Mission became a conduit for passage of subsidy for oilseeds crops with substantially reduced focus on technology generation and dissemination. An era of technology poor and subsidy rich Technology Mission thus began in mid 90s due to a combination of political, economic and administrative reasons. It would be very wrong therefore to place the blame on the Technology Mission as a concept and as an institution.

4.2.13.5 The picture would not be complete without commenting on the linkages amongst the MMs, since back to back approach was a critical component of the concept of Mission. In the first ten years of the Mission, CSIR played a very important role in providing the valuable component of post harvest technology and generated some viable research particularly for extraction units, which enhanced income opportunities for farmers and led to value addition. Fillip was also provided to establishment of oilseeds processing and extraction units and technologies for refining oil particularly soybean oil that led to very substantial growth of soybean oil consumption within the country with its well known benefits as a source of rich vegetable protein and simultaneous production of deoiled cake which commanded a premium price in international market for cattle feed production. This led to substantial growth in the incomes of the oil processing units and led to proliferation of
such units. The credit for the generation of this technology and the expansion of the skill of oilseeds processing industry must be given to CSIR which was an important stakeholder in the Technology Mission and whose representative was included in the regular staff of the Technology Mission.

4.2.13.6 The pulses component, however, failed to achieve the success achieved in the early years by the TMO, primarily because the new varieties with potential for quantum jump in yield could not be supplied by MM-I. For pulses, such major technological inputs were not available in 1990 and not much happened for generation and adoption of revolutionary packages of technologies. Moreover, necessary policy supports (inputs, pricing, marketing etc) were also not extended to pulses. Consequently, the productivity and profitability levels in pulses have remained stagnant in spite of its inclusion in the Technology Mission. Consequently, the farmers diverted better lands for other crops and only the marginal soils with little potential for quantum jump in productivity and profits were reserved for pulses. Obviously a Technology Mission could not achieve much in such cases especially when there was a lack of proper marketing infrastructure and price fluctuated in a wide range. Similarly, unlike oilseeds where processing and oil extraction held great opportunities for profit through domestic and international sales, pulses did not offer this incentive because of limited export market and inadequate technology for processing. Thus, even MM III & IV for pulses did not deliver the same results for pulses as they did for oilseeds.

4.2.13.7 In 1995-96, the then Union Agriculture Minister ordered the creation of a separate Technology Mission on Maize since maize offered good opportunities for quantum jumps in production and productivity, had a good export market particularly as cattle feed and also enjoyed a good market domestically as an industrial raw-material for starch. It therefore offered incentive for the farmers to increase production since the demand was growing. This was one crop, which was amenable to the Mission Mode. Unfortunately, since the Technology Mission on Oilseeds and Pulses had meanwhile started floundering due to indifference and adverse trade policies, the Planning Commission did not approve the setting up of Technology Mission on Maize. Strictly speaking therefore the Technology Mission Mode for Maize never really took off. It remained only a route to implement the existing
Accelerated Maize Development Programme of the DAC. Administratively-, however
the Mission Director for the Technology Mission on Oilseeds and Pulses was also
entrusted with the responsibilities for Technology Mission on Maize and maize was
therefore taken off from the overall umbrella of crops under Agriculture
Commissioner. Mission Mode for Maize was only a cosmetic appellation without the
benefits associated with a true Mission.

4.2.14 The Mid Term Appraisal of Tenth Five Year Plan for the Agriculture and
Food Security sector has also commented on the Technology Mission on Oilseeds and
Pulses as under:

4.2.14.1 “Pulses yields continued to stagnate although these crops have been under
a Technology Mission since early 1990s, and the area under cultivation has also
shrunk. Despite some promising new varieties and proven benefits from
micronutrients and sprinkler irrigation, there is as yet no breakthrough at the farm
level. Although the MSP of pulses has been increased recently to encourage
technology adoption, it is the view of the Commission for Agricultural Costs and
Prices (CACP) that a sharp increase in imports has blunted this effort. Oilseeds have
been under a Technology Mission since 1986 and there was substantial expansion of
area, yield and production till the mid 1990s. But in the absence of technological
breakthrough and because of pressure from cheaper imports, the Ninth Plan period
saw stagnation in yield and decline in area. There was a rebound to a record 25.1
million tonnes in 2003-04, but growth continues to be negligible. In the current year,
2004-05, there has again been a marginal fall in output. Imports of edible oils are now
at par with domestic production. Rising domestic demand, trade liberalization and a
sharp fall in world edible oils prices in the late 1990s contributed to this rise in
imports. Domestic prices of edible oils/oilseeds remained low and were disincentives
to domestic producers. Productivity improvements are required for domestic oilseeds
production to remain competitive. This calls for a fresh look at the working of the
Technology Mission on Oilseeds and Pulses (TMOP), which appears to be falling in
its objectives”.

4.2.14.2 Technology Mission on Oilseeds and Pulses and the Technology Mission
on Maize were discontinued in the Tenth Plan (2002-07). It was felt that the
Technology Mission on Pulses had not led to any appreciable increase in the productivity of pulses. While Mission Mode approach in the Technology Mission for Oilseeds has led to a significant increase in production and productivity, yet further increase in the production of oilseeds would be increasingly dependent on the market and price signal and the Technology Mission cannot \textit{per se} address these issues. It was, therefore, felt that the extension of the Technology Mission on Oilseeds and Pulses may not serve any effective purpose.

It was realised at highest level that Technology Mission had to address major issues regarding price procurement and custom duty and closely integrate research with development and Technology Mission with its present structure would not be able to achieve this objective. It was also noted that the DAC had not been able to suggest some alternate structure for this.

4.2.14.3 However, the importance of oilseeds crops for the farmers and for the country was recognized and the concerned departments were asked to continue various programmes and schemes for development of oilseeds, pulses and maize. There was, ample justification for giving special thrust to the oilseeds, pulses and maize not only from the point of view of reducing imports but also from the point of view of livelihood of farmers involved in their cultivation.

4.2.14.4 In this context it has however to be noted that DAC had prepared an alternative structure for the Technology Missions on Oilseeds and Pulses which could not be debated and meanwhile the Tenth Plan came into operation without the Technology Mission on Oilseed, Pulses and Maize.

4.2.14.5 However, TMOP was replaced by a comprehensive and integrated scheme of oilseeds, pulses, oil palm and maize with substantial outlays and with reasonably differentiated approach and restructuring of the erstwhile Oilseeds Production Programme, National Pulses Development Project / Accelerated Maize Development Programme and Oil palm. A greater flexibility was also provided to the States for inter-component diversion of funds and provision for innovations, participation of private sector in the implementation of the programme etc. Briefly, therefore, the stress on oilseeds, pulses, maize and oil palm was continued without the structure of the Technology Mission, which in any case had become fairly weak over the years.
due to several internal and external reasons mentioned earlier. It must also be said that it is doubtful whether the achievements of the Technology Mission on Oilseeds in the early years in a protectionist environment could be replicated in a far more open economic environment, both nationally and internationally, prevalent today.

4.3 Technology Mission on Cotton

4.3.1 Cotton is an extremely important commercial crop providing raw-material for 1500 mills, 4 million handloom and 7 million power looms providing livelihood to 60 million people who depend on cotton cultivation, processing and textile trade. On the economic front, India contributes around 15 per cent of the global cotton production and textiles including cotton contribute more than 20 per cent (2003-04) of total Indian export.

4.3.2 In view of lower yields and poorer lint quality of cotton as compared to many other countries, the Government of India launched Technology Mission on Cotton (TMC) in February 2000. The TMC is being implemented in 13 States viz. Andhra Pradesh, Gujarat, Haryana, Karnataka, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan, Tamil Nadu, Uttar Pradesh, West Bengal and Tripura.

4.3.3 The Technology Mission on Cotton consists of four Mini-Missions (MMs), MM-I on research is being implemented by Indian Council of Agricultural Research (ICAR), MM-II for enhancing production and productivity is run by DAC and MM-III on the development of market infrastructure and MM-IV on modernisation of ginning / pressing factories are being dealt by the Ministry of Textiles.

4.3.4 The MM-I and MM-IV are 100% funded by Government of India, while the expenditure for MM-II and MM-III are shared by Government of India & States on 75:25 basis and 60:40 basis respectively. The concerned Ministries are providing funds for implementation of their Mini-Missions.

4.3.5 The approved outlay for Tenth Plan is Rs. 568 crores, Rs. 355 crores, Rs. 108 cores and Rs. 85 crores respectively for the four MMs.
4.3.6 Achievements under various Mini Missions are as under:

4.3.6.1 MM I

The output under MM-I is primarily related to handling of biological population and basic research on cotton, hence, the output is composite by including quantitative and biological indicators.

- About 15 diploid and tetraploid cotton cultivars with high fibre quality have been identified for different zones of cotton cultivation for fast track release by All-India Coordinated Cotton Improvement Programme.
- In germplasm screening, genotype resistant to cotton leaf curl virus and jassids have been selected. Some entries have additionally been identified for drought tolerance.
- Evaluation of promising cultures for cottonseed oil provided seed oil content up to 27%.
- Morphological markers have been developed and documented to characterize the varieties and hybrids (including the parents) on the basis of easily identifiable characters. Bio-chemical and molecular finger printing of cultivars is also progressing fast.
- Evaluation of soil suitability for cotton based cropping systems was undertaken in 9 States and database developed for soil suitability has been processed for its depiction on soil resource map.
- Newer strains of bio-inoculants have been developed for their mass multiplication to result in sustainable and cost effective production of high quality fibre.
- In integrated Pest Management, almost 50% reduction in insecticide sprays was possible in IPM blocks as compared to farmers’ practice.
- In bio-control studies, fermented culture methodology was found suitable for mass production of *Tricoderma*.

4.3.6.2 MM II: Assistance has been provided during the Tenth Plan for distribution of certified seeds (37398 quintals), field demonstrations (60175), training of extension workers (883), Farmers’ training (4978), seed delinting plants (2), sprinklers (12339) and drip sets (2514) pest surveillance IPM demonstrations (5548) etc.
4.3.6.3 MM III: Improvement is undertaken in marketing infrastructure through setting up of new market yards, improvement of existing market yard and activation of dormant yards. 60 per cent of the cost of development being borne by GOI and the balance by APMC/State Governments. Central assistance is limited to Rs. 1.50 crores for new yards, Rs. 0.09 crores for improvement of existing yards and Rs. 0.25 crores for activation of dormant market yard, although this last category is no longer prevalent in the Tenth Plan. Grant in aid is provided to Agricultural Produce Market Committees. A total of 161 market yards have been sanctioned of which 93 have since been completed.

4.3.6.4 MM IV: Takes care of modernisation of ginning and pressing factories for which a capital subsidy @ 25% of the cost limited to Rs. 20 lakh per unit is provided. A total of 616 ginning and pressing factories have been sanctioned of which 322 factories have been completed. To achieve the enhanced targets, the Ministry of Textiles increased the number of consultants and the programmes have been placed at the disposal of the Cotton Corporation of India (CCI) in order to make the facility of manpower and infrastructure available in CCI for the project. CCI has a TMC cell headed by the ex-CMD of CCI which has been spear heading MM-III & IV. This strategy of earmarking a professional exclusively, with technical and administrative backup available from a professional body, can be cited as one major reason for the comparative success of MM-III&IV vis-à-vis other MMs.

4.3.7 Constraints impeding progress

(i) Nearly 65 percent cotton area is rainfed mainly in the Central and Southern zones.

(ii) Cotton crop is particularly prone to pests and diseases

(iii) The excessive use of pesticides and the synthetic pyrethroids have also led to development of immunity in insects against the pesticides.

(iv) Large scale use of linted seed by farmers causing poor plant stands resulting in loss of yields and build up of disease and pests.

(v) Wide fluctuation in cotton prices and inadequate market infrastructure.

(vi) High incidence of contamination in cotton due lack of proper marketing infrastructure and modernized ginning / pressing facilities.
4.3.8 Technology Mission on Cotton has its four constituents MM under different administrative Department / Ministries. The DAC had entrusted impact evaluation study of MM-II of TMC to Agricultural Finance Corporation Ltd. (AFCL). The main recommendations / findings made by AFCL, were as under: -

(i) Non-availability of certified seeds of new varieties / hybrids as a result of poor seed requirement planning by States.

(ii) The field demonstrations may be organized on five hectare size for more effective dissemination of technology.

(iii) Training courses for upgrading the knowledge and skills of farmers, extension officials are needed.

(iv) The establishment and production of bio-agents and their sale may be entrusted to private sector.

(v) Pheromone traps are not available in required number.

(vi) Adopting seed village concept would be appropriate for production of certified seeds.

(vii) The results of Insecticide Resistance Management (IRM) reported so far are encouraging and may usher in a new era in pest management in cotton.

(viii) All individual components of IPM need to be implemented as a package in the interest of cotton growing farmers.

4.3.9 The Ministry of Textiles have also taken up the impact assessment of the implementation of MM-III and IV by Textile Research Associations (TRAs) and Central Institute for Research on Cotton Technology (CIRCOT). Indian Cotton Mills’ Federation (ICMR) and East India Cotton Association (EICA) have also been associated with the impact assessment. Preliminary report of impact assessment suggests that the development of market yards and modernization of G&P units will help textile industry in getting good quality of cotton. The trash percentage in cotton processed by the modernized ginneries has also come down from 6-8% to less than 2%.

4.3.10 The Technology Mission on Cotton has helped to achieve the target of production of cotton. The production target under TMC was set at 215 lakh bales by the terminal year of the Tenth Plan. The cotton production during 2005 has however touched a peak record at 232 lakh bales and record productivity of 440 Kg per hectare.
as per the estimates of Cotton Advisory Board (CAB) in the Ministry of Textiles. Besides, pesticide consumption has decreased in cotton resulting in decrease in cost of cultivation and thereby raising income of farmers. However, the productivity of cotton in India needs to be increased further. To improve the production, productivity and quality, following points are suggested:

(i) To bring more area under irrigated / semi-irrigated conditions particularly in central and southern zones.

(ii) Providing matching share by State Governments under MM-II and MM-III of TMC and timely release of funds by them.

(iii) Immediate modernization of more ginning & pressing factories to improve the cotton quality.

(iv) In situ conservation of rainwater by dovetailing watershed and other such schemes.

(v) States to involve industries, cooperatives as stakeholders in the implementation of TMC particularly through contract farming.

(vi) All cotton growers to be covered under Crop Insurance.

(vii) Cotton Corporation of India, NAFED etc. needs to be strengthened so that no cotton is sold by farmers below MSP.

(viii) More efforts for educating farmers and others to reduce cotton contamination.

(ix) Stringed punishment for spurious sale of seeds included Bt-cotton as well as pesticides / bio-agents etc.

4.3.11 The Mid Term Appraisal of Tenth Five Year Plan for the Agriculture and Food Security sector has however commented on the Technology Mission on Cotton as under:

“Cotton production had also fared poorly during the Ninth Plan. Yields decline due to a combination of lower prices and increased pests incidence following rapid price-induced area expansion in the previous decade. India’s cotton economy continues to suffer from well-known problems causing low yield and poor quality. It is also well known that, if these problems are addressed, very large gains are possible with end of the Multi-Fibre Agreement. In view of this, a Technology Mission on Cotton (TMC) was launched in February 2000 and approval given for cultivation of Bt varieties. With limited results from these efforts thus far, mills are importing larger quantities of
quality cotton. There is an urgent need to re-look the TMC and in particular, to involve the textile industry more closely on cotton technology”.

4.3.12 Analysis

4.3.12.1 The Technology Mission on Cotton (TMC) has been analysed in the First Report of the NCF (Serving Farmers and Saving Farming, December 2004) in Chapter VI on “Enhancing Cotton Productivity, Quality and Global Competitiveness”. It has already being commented that the performance of the Technology Mission as a whole has been mixed. While MMs III & IV appear to be working satisfactorily towards achievement of physical targets for establishment and renovation of market yards and renovation and modernization of ginning units respectively, the achievement of MMs I & II do not appear to be on track. Mere increase in yield and production during 2003-04 and 2004-05 cannot go to prove the efficacy of the MMs I & II since good prices in increased areas of Bt hybrids as well as increased involvement of cotton mills and private sector for technology transfer have been equally responsible for the higher yields. The core activity of MM-II would have involved a quantum jump of supply of seeds of open-pollinated varieties and the adoption of INM, IRM & IPM technologies beyond the project areas; this does not seem to have happened.

4.3.12.2 Another major shortcoming in the TMC appears to be the operation of the four MMs in seclusion without observable linkages and integrations. This has resulted in sub-optimal performance of the TMC. Some of the States also have not contributed their share of the budget and have consequently under-utilized the central resources particularly in MM–II. Consequently, the TMC is reduced to a routine departmental programme, individually implemented by the concerned departments. Unless the various MMs work together cutting across departmental lines and receive inputs and provide feedback to the other partner MMs and to the State governments, the benefits of the Mission approach would be difficult to achieve. Indeed, some growth in production and productivity would in any case come about in the normal course as has been happening with many other crops which do not have the benefit of a Mission for them. Even though cotton is an extremely important crop with wide ramification for the income of farmers and export earnings for the country, the Technology Mission on Cotton has not performed comprehensively to its full potential.
4.3.12.3 It may be useful to analysis some of the reasons for the varying success of the various MMs under TMC.

4.3.12.3.1 Mini-Mission I

As regards MM-I, the progress had been slow because the process of research and development of new varieties of seeds is a time consuming job. This research job is undertaken either by the Government Department or by the Government Institutions where they have to follow all the procedures, which further take time.

4.3.12.3.2 Mini-Mission II

In MM-II again the transfer of technology is undertaken by the Ministry of Agriculture, Govt. of India through the State Governments. If the attitude of the State Government is indifferent naturally the progress becomes slow. It is felt that the results and the extent of success of MM-I and MM-II may become more clear after the passage of few years.

4.3.12.3.3 Mini-Mission III

As against MM-IV, the MM-III i.e. modernization of existing Market Yards or setting up of new modern Market Yard had been some what slow.

- In the initial years, the cash rich Market Yards came forward and modernized the Yards by taking TMC share, as they did not need any money from the State Government.
- However, Market Yards with shortage of funds had to depend on the State Governments for their share for modernizing and hence the progress of modernization of Market Yards has now become slower.
- The Market Yards undertaking modernization have to follow the prescribed procedure of the Government for sanction, tendering etc. which require lot of time.
- The participants in the modernization i.e. Market Yards, State Governments do not feel any direct economic benefit as in the case of Ginning & Pressing factories where direct economic benefit goes to the owners.
4.3.12.3.4 Mini-Mission IV

The reasons for the better success of MM-IV can be brought out as under:-

- **The first and foremost reason for the success had been the single window system between the Government through Technology Mission on Cotton and the entrepreneurs i.e. Ginning & Pressing Factory owners or prospective entrepreneurs.**

- **Due to expected increase in the productivity and production of cotton**, the Ginning & Pressing factory owners were eager to modernize their factories to compete both domestically as well as globally for sale of their cotton and to have larger turnover and profits.

- **Due to increased demand for cleaner cotton** as well as for contamination free cotton and the willingness of the spinners (textile mills) to pay a premium on cleaner cotton, entrepreneurs came forward both for modernization of their existing factories as well as for setting up of new factories.

- The Cotton Corporation of India Ltd. (CCI), which was the implementing agency for TMC under the Ministry of Textiles, Govt. of India, started giving preference to the modernized units for processing its stocks. This also motivated many of the Ginning & Pressing factories to modernize.

- The technology i.e. machinery and equipment proposed for the modernization of the Ginning & Pressing factories was available indigenously from multiple manufacturers and hence the same was available on short notice and at competitive rates.

- **Direct economic benefit** to the Ginning & Pressing factories due to larger turnover, reduced complaints and better client relationship with the spinning mills motivated the Ginning & Pressing factories for modernization.

- The cost benefit analysis indicated larger profit margin in processing and packing of cotton to the Ginning & Pressing factories due to savings in electricity, repairs and labour as compared to conventional factories.

- The results were assured and guaranteed benefits in terms of productivity; quality of processing and reduction in contaminants and risk factor was limited one for the production of cotton in the catchments areas.

- The Ministry of Textiles, Govt. of India and CCI with the help of other institutions like Office of the Textile Commissioner, Textile Committee,
CIRCOT, ATIRA etc. held awareness meetings by involving all sectors like Ginning & Pressing factory owners, Spinning mills, farmers etc. to motivate for modernization.

4.3.13 Remedial Measures

4.3.13.1 Looking to the importance of cotton as a crop for a very large number of farmers, particularly in the dry lands and its downstream contribution, to a very large numbers of weavers and high end industrial products in textile which have vast foreign and domestic markets and considering the opportunities expected to arise due to the demise of the Multi-fibre Arrangement in 2005, it was only appropriate that the Mission approach for cotton was adopted in 2000, itself in order to achieve growth in production and productivity of cotton and expansion of facilities for marketing and processing of cotton into textiles. It was also conceptually in order to work through the four MMs since the goals of the Mission could not be achieved by a single department. Concerned departments like Agricultural Research, Agriculture and Textiles had to come together for coordination and implementation to achieve the prescribed goals within the shortest possible time. However, certain congenital problems need to be highlighted at this stage, which constrained the TMC from the very beginning. The Technology Mission must be a self-contained entity with its own full time professional Mission Director who could tap on the expertise of experts in research, extension, marketing and processing for value addition. As it were, the Agriculture Commissioner with his multifarious duties relating to various crops was designated as Mission Director. Not-withstanding his expertise seniority and position in the Government, he could not be expected to devote single minded attention to the activities of the Mission. Even the lower levels of the administrative hierarchy were burdened with other responsibilities for many other crops and this too acted adversely on the focus needed for cotton in the Mission Mode. Cotton, therefore, became just another crop in the portfolio of the Agriculture Commissioner thereby whittling down the very concept of Technology Mission.

4.3.13.2 It is further noted that no separate staff has been provided for the TMC and the work is being handled through deployment from amongst the existing departmental staff. Once again the degree of single-minded devotion to the goals of the Technology Mission seems to be missing. The staff also has not been selected on the basis of any specific suitability but on the basis of administrative convenience. A
specialized vehicle like a Mission cannot run to its full potential with such a diffused human resource.

4.3.13.3 Even, the Committee system of directing, controlling and monitoring, although well designed had its problems in practice because senior officers were not attending the various meetings due to their pre-occupation and adequate steps do not seem to have been taken to ensure their attendance. Consequently, the effectiveness of the meetings in sorting out coordination issues suffered. It would be necessary for instructions to be issued that only officers above certain levels should attend the meeting on these departmental committees for the various MMs.

4.3.13.4 Presently, the Cabinet Secretary is the Chairperson of the Empowered Committee and this is ample evidence of the importance attached by the Government to TMC. It is, however, seen that the meetings of the Empowered Committees are not frequent enough in view of the pre-occupation of the Cabinet Secretary who cannot be expected to devote enough time to the deliberations of the Committee on a continuing basis. It may perhaps be desirable to consider naming Secretary (Coordination) to be the Chairperson for the Empowered Committee on behalf of Cabinet Secretary.

4.3.13.5 In view of importance of cotton both for the farmers and India’s domestic and international trade, the TMC is a thrust area under the Prime Minister. While, this is very welcome, it has added to the volume of reporting by the TMC in respect of progress of the Mission. While monitoring is extremely important, a lot of time gets devoted to compilation of data, which become repetitive. There appears need to rationalize reporting of the TMC in order to ensure more time for the officers to devote to the actual work of the Mission. Particularly touring. Perhaps reporting only to the Empowered Committee and to the Planning Commission may suffice.

4.3.13.6 The Mission guidelines also provide for National Level Monitoring Team (NALMOT) consisting of officers from the Mission and knowledgeable retired officials who tour in the field in order to provide ground level information about the quality of implementation in stead of mere statistics. While this is a very welcome initiative it may be useful to make these monitoring teams a little more broad based with involvement of farmers/NGOs also. It is however learnt that the State Level Monitoring Team (SALMOT) have not functioned with equal efficacy. It may be
useful for the Empowered Committee to specially review the functioning of monitoring at the State level and give suitable directions to the defaulting States.

**Box- 1**

**Insecticide Resistance Management in Cotton**

1. Cotton pest management has become complicated over the past one decade. The incidence and damage caused by American boll worm (*Helicoverpa*) during the 1997-98 seasons was the most severe in recent times. It is estimated that yield losses up to 25-50% were caused, primarily due to *Helicoverpa armigera* coupled with bad weather and farmers were forced to use more insecticide applications of up to 20-30 rounds. Based on studies at Central Institute of Cotton Research (CICR), evidence indicates that excessive use of insecticides also led to problems of insecticide resistance in *Helicoverpa* and *Spodoptera*, which further necessitated the repeated application of insecticide. Scientists have focused on the management of resistant pests through the use of the insecticide resistance monitoring data generated over many years and a simple strategy based on ecological principles was designed to conserve beneficial organisms to assist pest management.

2. Area wide farmer participatory ‘Insecticide Resistance Management’ (IRM), field demonstrations were carried out by scientists in nine villages in Maharashtra, three villages in Andhra Pradesh, eleven villages in Punjab and one village in Tamil Nadu. These were just the beginning of a planned effort to help the Indian farmer appreciate the value of making good pest management decisions.

3. In an excellent case study in Wardha district in Maharashtra, about 650 farmers of nine villages have harvested an average of 800 to 1600 kg. of seed cotton (kapas) per hectare with just two third of the normal production cost due to saving accrued from reduction in insecticide use. The IRM strategy was implemented in about 1200 hectares. Ninety per cent of the farmers sprayed 0-1 times at Economic threshold limit (ETL) of *Helicoverpa armigera* (American Bollworm) mostly with Endosulfan at a time when resistance of bollworm to this chemical was the least. This resulted in 70-80 per cent reduction in pest population.

4. Based upon the experience gained by scientists, Central Institute for Cotton Research (CICR) of Indian Council of Agricultural Research (ICAR), proposed to the DAC, Ministry of Agriculture to adopt this technology and provide funds as the institute will carry out the project.

5. Accordingly, the DAC provided funds to CICR for this purpose under MM-II of Technology Mission on Cotton. 26 districts in the country were selected where maximum pesticide consumption takes place. In each district 20 villages were selected. A Project Officer having sufficient knowledge in IRM was meant for each district while 20 skilled field worker (one for each village) was also assisted under the scheme for their salary etc. The Project Officer with a two-wheeler moves around 20 villages to guide continuously the field workers who will in turn guide farmers throughout the cotton season for the pest management particularly in the use of insecticides so that besides pest management, the resistant in pests does not evolve quickly with the results the number of sprays decreased and accordingly the pesticide use was reduced substantially. Furthermore, assistance was also provided under IRM project towards farmers’ field days, farmers’ exchange programme, training of project officers, field workers, publication of training manuals, booklets etc.

6. The IRM project made tremendous impact in pest control in the selected villages and improved productivity and economic conditions of the cotton growers substantially. This can be judged from the progress of IRM during 2004-05. As per report of CICR for the year 2004-05, the IRM project was implemented in 11 major cotton-growing states in the country covering 444 villages in 27 districts. 21617 farmers adopted these strategies on 61732 ha area under cotton crop. The average number of cotton sprays was reduced from 8.93 in case of non-adopting farmers to 4.8 in case of adopting farmers resulting in 46% reduction in number of sprays. Rs.2890/ha were saved in case of IRM farmers on account of the cost of plant protection and also 11% increase in the yield resulted in to Rs.6900 additional profit over the non-adopting farmers besides less environmental pollution.
**Box- 2**

**Contract Farming in Cotton**

1. The cotton produced by the farmers is used by the mills for the manufacture of textile goods. The value of textiles and garments depends upon the quality of cotton i.e. various characteristics of cotton fiber and contaminants therein. Therefore, the mills require a specific type of cotton to meet their specific requirement. In this process, it is very important that farmers should produce the type of cotton and the quantity required for use by the mills. In this respect, it will give more dividend if farmers i.e. the producer and the mills i.e. the user, are brought face-to-face for the type of cotton and quantity of the cotton required by the mills through a kind of contract farming. This will provide linkage between farmers and mills.

2. The necessary contract farming rules can be framed by both producer and user themselves. In fact, such contract farming has already started in India for cotton. The contract farming started by Appachi Indian Company, Pollachi and others as well as Cotton Corporation of India (CCI) in the Ministry of Textiles in some states during 2002-03, are the examples of such endeavours. CCI organized first such national level Seminar in Hyderabad during 2002 and started such contract farming in cotton during 2002-03 itself.

3. Besides initiatives by private sector and CCI, the Tamil Nadu Government, with the active involvement of CCI, has also started contract farming in cotton with the mills in Tamil Nadu during 2005-06.

4. The benefit of contract farming is:

   **For the Industry:**
   Assured supply of good quality, unmixed and uncontaminated cotton, thus no more hassles of importing cotton.

   **For the Growers:**
   No dilemma about choice of seed / variety and buying inputs. Easy availability of loans for buying inputs. Higher yields with reduced expenditure leading to more profit from cotton cultivation. Easy and assured sale of cotton. Mills often facilitating supply of inputs / services for the success of contract

5. CCI is actively facilitating / catalyzing the contract farming in the country since 2002-05. Since 2005-06, CCI has also been involved for the implementation of MM-II of Technology Mission on Cotton, which will help CCI to accelerate bringing farmers and mills in contract mode of cotton production and procurement. The mills and others involved in contract farming are as under:

   - Many mills come forward to collaborate contract-farming programme in cotton with CCI. Some of them are (i) Nahar Group of Mills, Ludhiana (ii) Gokak Group of Mills in Karnataka (iii) Pratibha Sintex, Indore (iv) Super Spinning Mills, Coimbatore (v) Sanghi Spinners India Ltd. Hyderabad.
   - Royal Classic Mills (Tamil Nadu) has also come forward for contract in collaboration with State Government and CCI.
   - Private organizations like Appachi Cotton Co., Pollachi that have followed contract programme since 2002-03, have also joined CCI for implementation of the project during 2005-06.

6. The coverage in cotton contract, which is still at initial stage, has shown very encouraging results. The coverage of the cotton contract since 2002-03 particularly by CCI is as under:

   - CCI has taken up programme project during 2002-03 for first time in four states, viz. Gujarat, Madhya Pradesh, Andhra Pradesh & Orissa covering an area of 2996 hectares in 92 villages involving 3157 farmers.
   - During the same year programme was also taken up by three other organizations viz. Super Spinning, Coimbatore, Appachi Cotton – Pollachi, and Amit Traders in Andhra Pradesh, on an area of 11500 hectares. Thus, during 2002-03 contract farming in cotton was taken up on an area of 14496 hectares in the country.
   - During 2003-04 CCI had taken up the programme on an area of 1250 hectares in the states of Haryana and Andhra Pradesh involving 713 farmers. Other organizations in the state of Maharashtra (4), Karnataka (2), Punjab (1), Haryana (1), Gujarat (1), Andhra Pradesh (1) & Tamil Nadu (1) have taken up the programme on an area of 4196 hectares.
   - During 2004-05 CCI has taken up the programme in collaboration with other companies on an area of more than 6000 hectares. Others have also undertaken on area of 2648 hectares on their own.

7. The past results obtained by CCI in such contract farming programme, are briefly as under:-

   - Productivity was increased. Productivity increase from 80 kg to 240 kg. was observed in different locations.
   - Cost of cultivation was lower.
   - The quality of cotton was superior in case of contract farming fields as compared to other fields, as mixing of variety was not there.
4.3.13.7 A major problem identified for the TMC is the financial release procedure for assistance. It must be remembered that Technology Missions must be treated as a special purpose vehicle for achieving specified goals in the shortest possible time. Obviously, therefore, the rules and procedures for Technology Missions must be different from those, which govern the normal programmes of the Ministries. Specifically speaking, it is well known that in spite of improvements, the procedures for release of funds from the Central Government to State governments take time and are in many cases not in tune with the requirements in the field, because of the time schedule of the budgetary exercise. There is a substantial delay in the release of funds received from the Central Government to the field, especially when the State share has to be provided. Such procedural bottlenecks are lethal for work in the field since crop cycle particularly for cotton demands availability of funds at the beginning of the crop season in April itself. This too is a issue which should be addressed on priority by the Empowered Committee. It may be worthwhile to follow the pattern whereby funds from the Ministry of Rural Development pass directly to the District Rural Development Agency. It may also be worthwhile to see whether the procedure followed in the Technology Mission for Horticulture in the North-Eastern region of routing funds through Central and States level Small Farmers Agri-Business Consortium (SFAC) could be followed.

4.3.13.8 In general, while it can be said that Technology Mission on Cotton has benefited due to the multi stakeholders’ involvement, it must also be commented that certain key areas still require greater and time bound attention for MM-I. It would be very necessary to develop extra long/long staple cotton varieties, which not only have the requisite length but also have the strength. This would help in generation of higher incomes for farmers undertaking production of extra long/long staple varieties of cotton and would also reduce and hopefully ultimately eliminate large imports of Egyptian cotton. Another area where ICAR would have to work harder in MM-I relates to research for Bt. Cotton hybrid in the public domain, in order to provide competition to the private sector, which rules this segment, and also to protect farmers from the high prices being charged by the private sector. Bt cotton has grown in terms of area coverage in most States, even though the varieties in the private sector were not formally released by the ICAR system for quite sometime simply because of its known high productivity and in spite of its high price. It is, therefore, clear that more
and more farmers would go in for Bt varieties if only they could get the quality assurance and reasonable price of seed.

4.3.13.9 While MMs III & IV have been doing well it must be recognised that the consumption of cotton in the mills is not rising, commensurate with the rising production in the wake of increase under Bt cotton and the work done by the MM-II for increasing the production and productivity of cotton. If this situation is allowed to continue, the higher supply and stagnant demand would lead to a fall in prices of cotton, causing substantial distress to cotton farmers and adverse effect on their desire to grow cotton as also their willingness to invest in the requisite quantities of inputs. While the Technology Upgradation Fund of the Ministry of Textile has benefited the mills substantially, a lot can still to be done beyond the stage of ginning. It is unfortunate that yarn is being exported to China and its conversion to textile through expansion of capacity and modernisation has not been up to the mark. It must be recognised that increase in area, production and productivity of cotton by itself may be desirable at the macro level but it is the income of the farmers which should be the major concern and this can be achieved only if the marketing arrangements and demands improve substantially. The real challenge lies in enhancing the quality awareness amongst farmers and ensuring transparent and scientific marketing and finally modernisation of the through the various stages. This can be and has to be achieved through more frequent interactions between the farmers and NGOs, scientists, and mills. TMC is the ideal instrument to facilitate this interaction on a continuing basis in order to positively assure incomes of cotton farmers.

4.3.13.10 Considering the priorities and potential of the TMC and taking in to account the operational problems which are making the Mission prone to business as usual approach and making it a clone of the normal Intensive Cotton Development Programme, it would be timely to set up a National Cotton Council with participation from farmers, Textile industry, NGOs, public sector and other major stakeholders under the chairmanship of Union Agriculture Minister and with Union Ministers of Textile and Commerce serving as Co-Chair persons. The establishment of the National Cotton Council on the lines of International Cotton Council has already been recommended in the First Report of the NCF. (Para 20 of Chapter VI)
4.4 Technology Mission for Integrated Development of Horticulture in North Eastern States, J&K, Himachal Pradesh and Uttarakhand

4.4.1 The Technology Mission for Integrated Development of Horticulture in North Eastern States, J&K, Himachal Pradesh and Uttarakhand Scheme was launched in the eight North-Eastern States namely Arunachal Pradesh, Assam, Manipur, Meghalaya, Mizoram, Nagaland, Tripura and Sikkim w.e.f. 29th February 2001. During the Tenth Plan, the scheme was extended for implementation in other three contiguous hill States namely Jammu & Kashmir, Himachal Pradesh and Uttarakhand w.e.f. 23rd August 2003.

The objectives of the Mission, now running in its fourth year, are as under:

- To establish Convergence and Synergy among numerous ongoing governmental programmes, achieve horizontal and vertical integration of these programmes
- To ensure adequate, appropriate, timely and concurrent attention to all links in the production, post harvest and consumption chain
- To maximize economic, ecological and social benefits from the existing investment and infrastructure created for Horticulture development and
- To promote ecologically sustainable intensification, economically desirable diversification and skilled employment.

4.4.2 The Mission is being implemented in a mission mode with an end-to-end approach which includes development and introduction of high yielding varieties and technologies, expansion of area, post harvest handling and management, marketing, value addition and processing of horticultural produce with the following four MMs.

4.4.2.1 MM I: Research – coordinated and implemented by Indian Council of Agriculture Research. This MM concentrates on technology generation appropriate to the region. Major components under MM-I are supply of basic seed and planting material, technology standardizations, refinement, on farm demonstration and training.
4.4.2.2 MM II: Production and Productivity – coordinated by DAC and implemented by State Departments of Horticulture/Agriculture. This MM aims at increasing production and productivity of Horticulture crops by adoption of improved production Technologies.

4.4.2.3 MM III: Post-harvest management and Marketing-coordinated by DAC and implemented by Directorate of Marketing & Inspection/ National Horticulture Board. This MM aims for efficient post-harvest management techniques, which include development of cold storage facilities, efficient transport and marketing facilities etc.

4.4.2.4 MM IV: Processing-coordinated and implemented by Ministry of Food Processing Industries, Government of India. This MM aims at promoting processing industry for value addition to Horticulture produce by promoting new processing units, up gradation of existing units.

4.4.3 A total of Rs.453.36 crores were allocated for the Mission since inception. By far, MM II accounted for the highest share of Rs. 368 crores followed by MM III with a share of Rs. 56 crores. MM I & IV lagged at Rs.18 crores and Rs. 9 crores, respectively. Together, MM II and III accounted for more than 90% of the funds allocated. The proportion of subsidy as a percentage of total outlay was as high as 95%. During the Tenth Plan a total of Rs. 386.11 crores were allocated out of which more than 90% was allocated for MM II and MM III. In fact, the allocation under MM II is nearly 20 times that under MM I.

4.4.4 Under MM I, the coordinating research institutes have identified suitable crops for developing technologies and for production of planting material in the region.

4.4.5 Under MM II, assistance was provided for promotion of potential horticulture crops in these States besides creation of infrastructure facilities for improving the productivity of the crops such as irrigation sources, integrated pest management, protected cultivation, organic farming, on-farm handling and other related activities. In addition, assistance was provided for training of farmers within
and outside the States, training of trainers as well as women entrepreneurs involved in horticulture programmes for large-scale adoption of scientific technologies in these States. Besides some of the major achievements reported under MM II include bringing an additional area of 55,087 hectares under various horticultural crops, which includes fruits (24887 ha), vegetables (9336 ha), spices (13445 ha), plantation crops (3713 ha), medicinal plants (1125 ha), aromatic plants (1683 ha, flowers (793 ha). This amounted to an increase of nearly 8%. Among the 8 NE States Sikkim, Mizoram recorded a maximum percentage increase in area of 38.11% and 34.83% followed by Arunachal Pradesh (17.45 %) and Nagaland (13.8%). Among the perennial fruits expansion of area under citrus fruits, which includes orange, lime, lemon is 7286 ha followed by banana, (4503 ha) passion fruit (3885 ha) pine apple (3214 ha) and apple (1113 ha) & litchi (1109 ha). Besides, Kiwi was introduced in an area of 65 hectares Among spices, ginger cultivation has increased by 3356 ha followed by large cardamom 3775 ha, black pepper and turmeric. An additional area 1125 ha of medicinal plants, 1683 ha of aromatic plants and 818 ha of flower crops have increased the opportunities for tapping the potential of high value crops over the pre-mission period (2000-01). A few States like Mizoram and Manipur have made impressive progress in vegetables, promoting cultivation of second crop in a year after paddy, adopting cluster approach, thus helping the growers to earn better returns from same unit area of land. Major success has been achieved in promoting Anthurium in Mizoram using planting material imported from abroad through a private company based in Bangalore. Besides, grapes (Bangalore Blue variety) are being promoted in and around Champai. Passion fruits of Kaveri variety of Bangalore are being popularised on a large scale in Mizoram, Manipur and Nagaland. A total of 295 nurseries have been set up. A successful mushroom unit has come up near Mao in Manipur cultivating ‘shitake’ and button mushrooms involving 200 farmwomen. Success was reported in creation of water bodies and on-farm water management. Under the component of organic farming, 535 earthworms /vermi compost units were reported to have been developed. Training of farmer/extension officers has also been taken up. The tissue culture laboratories have been mostly set up by the State Directorates of Agriculture.
4.4.6 Under MM III, assistance was provided for development of 29 wholesale markets, 199 rural primary markets, 26 Apni Mandis and 15 State grading laboratories.

4.4.7 Under MM IV, assistance has been provided for establishment of 9 processing units.

4.4.8 Analysis of the constraints affecting the Mission:

4.4.8.1 Unlike the other Missions, the TM for NE & Himalayan States is not restricted to a single crop. Keeping in view the diverse climate and favourable soil conditions conducive for their commercial exploitation in the Himalayan hill States, the Mission focuses on horticultural crops. The entire Himalayan region is a favourable agro-ecosystem for growing a wide range of fruits, vegetables, medicinal and aromatic plants and other cash crops. The holistic development of horticulture in the region with backward and forward linkage is expected to result in horticulture led transformation in terms of increased productivity, nutritional security, enhanced income and well being of the local farmers.

4.4.8.2 However, review of the Mission activities shows a large gap between the original concept and actual implementation in the field. This was brought out clearly in the First Report of NCF. A Committee was set up by Ministry of Agriculture to carry out the Technical Evaluation of this Technology Mission. This Committee submitted its Report in 2005, which highlights the problems observed in the implementation of the MMs.

4.4.8.3 A total of Rs. 18.8 crores was allocated under MM I. Five ICAR institutes/centre based in the North East region are involved in implementing the R&D programmes of MM I. R&D activities taken up under MM I do not provide need-based technological support for the crops and activities identified for development by the States. It was found that the States had not consulted the ICAR for the varieties/hybrids recommended for particular State/region of the crops identified for area expansion under MM II.
4.4.8.4 No evaluation of suitability and quality of varieties/hybrids marketed by the private companies and freely used by the farmers was undertaken by the ICAR Institutes.

4.4.8.5 Similarly, experimental trials had not been carried out for all the States to evolve package of practices appropriate to the agro climate condition for guidance to the departmental staff and the farmers. The State departments also did not place any requisition for specific information/technical advice before implementing the area expansion programme.

4.4.8.6 The ICAR Regional stations have also not taken up any systematic studies for developing packages of practices including vegetative propagation techniques. It was observed that the farmers were applying inputs in an arbitrary manner.

The ICAR units are also not involved in the working of different laboratories allotted to each State.

4.4.8.7 Under MM II, a total of Rs. 368 crores were allocated since inception. Every State has been allotted financial support for all crops and all the components, irrespective of the commercial potential and need, suggesting a lack of an agro-ecological and comparative advantage approach in priority setting.

4.4.8.8 It was also observed that each district had been allotted all the crops with small area fixed as target for each crop. Such an approach is not conducive to long-term impact of the investment being made in area expansion, nor is conducive for proper planning of infrastructure for storage, marketing or processing of the produce expected from each district.

4.4.8.9 Varieties / hybrids promoted are chosen arbitrarily mostly out of those available in the market, irrespective of the adaptability and superiority. In fruits, selection of some crops was done in an arbitrary manner without any established experience of the crops performance in the States; for example, Meghalaya was found promoting cultivation of peach and apricot in high altitude, which is not congenial for temperate fruits. A high mortality was observed in tree crops. The beneficiary farmers selected for area expansion in tree crops did not have any knowledge or training,
methods of planting, nursery plant in the open field and their after-care. No authentic records were maintained on the survival of the plant supplied, nor was any formal mechanism in operation in the district to monitor the performance. It can therefore be presumed that the area planted a few years back would have no surviving plants, and the same area could even be earmarked for area expansion programme in the coming years.

4.4.8.10 Production of planting material is yet to take off within the States and hence procurement is done from outside the State from untested sources. A permanent damage thus likely to be inflicted because of the perennial nature of the fruit species.

4.4.8.11 Procurement procedures for seed and planting material adopted leave considerable doubt about the quality of the planting material being used. In some States, procurement is done through authorised dealers who do not necessarily have knowledge of handling agricultural material. In a few other States, the farmers are asked to buy the planting material themselves, again leading to inferior material being used.

4.4.8.12 The subsidy per hectare for area expansion under MM-II is Rs. 13,000 per hectare wherever the seeds/planting material was supplied to the farmers by the Department. The cost of planting material was deducted from the total subsidy allowed and balance paid to the beneficiary for input purchase. Except in one or two States, no inputs seem to have been applied nor any instruction to the effect given by the staff. Consequently the objective of granting subsidy for input application as a component of improved technology was not achieved.

4.4.8.13 A total of 295 nurseries were set up but there was a shortage of planting material. The nurseries in the public sector suffer from acute shortage of funds and there is no verification of genuineness of mother plants being used for further multiplications in the private or public sector. Unless mother plants are developed from genetically superior clones of a particular variety, the nursery programme is bound to suffer from serious technical deficiency contributing to proliferation of inferior types through area expansion programme.
4.4.8.14 The design of organic farming structure varied from State to State despite the fact that the guidelines for the TMHNER had provided all the details and drawings. This clearly points to lack/absence of monitoring by technical staff of the State departments.

4.4.8.15 Assistance for highly technical units such as plant tissue analysis lab, disease forecasting lab, tissue culture units, plant health clinic etc has been provided to all States irrespective of the needs, competence of the staff and availability of appropriate technology for using the facilities for the farmers. Each State has been allotted more than one tissue culture unit for multiplying banana, Anthurium, orchid etc. This type of investment would be justified only when the demand for planting material is not less than one or two lakh plants for each unit to make these units economically viable. It will be difficult to sustain operations of these laboratories without trained manpower and recurring expenditure.

4.4.8.16 Under MM III a total of Rs 5600 lakhs were allocated since inception and 29 wholesale markets, 199 rural primary markets and 26 Apni Mandis were established, besides 15 State grading laboratories were reported to have been established as per the progress report of each State. However, Tripura and Nagaland have not set up any market. The structure created in Mizoram for collection and storage was found to be technically deficient in design, as it does not provide for any improved method of cleaning, grading, packing and storing. This could lead to post harvest loss. Infrastructure for Post Harvest Management (PHM) including marketing and processing is planned without any relation to the total production targeted at a given point of time.

4.4.8.17 The funds under MMIV were allocated for setting up new units as well as upgrading some existing units. In total 9 units have been set up out of which two are upgradation ventures. No established private sector firm has taken the advantage of MOFPI facilities under MM IV to set up units in the North Eastern Region. These were set up by NGOs or State/regional undertakings. Under MM IV a total of Rs. 9.66 crores was allocated since the start of the Mission. In the first two years Rs. 4.25 crores were released in the North-Eastern States for setting up processing units mostly in Manipur, Meghalaya and Mizoram. Out of this Rs. 2.15 crores or nearly 50% was
sanctioned to one unit in Mao, Senapati district Manipur, which is processing passion fruit. It was found that the plant was negotiating with the producers in three States for the supply of raw material. The plant should operate in two shifts each day for at least 200 working days in a year to make it a viable venture. During 2003–04, no funds were sanctioned for North-Eastern States. A total of Rs. 5.41 crores were sanctioned during 2003-04 & 2004-05 for the Himalayan States out of which Rs. 2.2 crores were released.

4.4.8.18 The Food Processing sector in the North-Eastern States has been in existence for more than 40 years on a very small scale. Performance of the existing units is far from satisfactory. Most of the units have become economically unviable resulting in closure. The common reasons for poor performance are:

- Lack of stable links between the grower and the processing units on the one hand and the processing units and markets on the other.
- Dependence of units on a single fruit rendering the plant un-operational for a major part of the year.
- Absence of adequate post-harvest management structure
- Absence of tetra / aseptic packaging
- Inadequate credit including working capital from banks and other financial institutions.
- Inadequate power supply
- High cost of transportation due to difficult terrain, frequent bandhs etc.
- Inability to take advantage of opportunities offered by border trade
- Lack of quality testing facilities
- Lack of good manufacturing practices
- Problems related to entrepreneurial ability and intent
- Problems of collateral security for raising bank finance given customary land tenure system

4.4.8.19 With the host of problems mentioned above, it is not surprising that private sector is reluctant to invest in this part of the country in spite of incentives under the North-East industrial policy and departmental promotional programmes. For food processing units, heavy equipments are purchased including imported ones, which if
not utilized, would be deprived of the cover available for any defect under the warranty clause of each supply contract. The machines especially calibrated ones may lose their accuracy if kept idle for a long time. Therefore, without adequate supply of raw material and proper planning, investment on expensive equipments purchased in the beginning will go down the drain. With troubled history and failure of processing units to take off under the Technology Mission a serious mismatch may occur between MM II and MM IV.

4.4.8.20 The issues highlighted above clearly show that each MM is working independent of the other under the control of their respective administrative agencies. Linkages among the four MMs are weak.

4.4.8.21 With subsidies under MM II eating up the largest share and without any credible linkage established with MM I, the Mission has turned out to be subsidy rich and technology poor.

4.4.8.22 Consequently, the basic objective of the TMHNER of promoting integrated development of Horticulture in the region for improving production with the induction of improved technologies has not been achieved so far.

4.4.8.23 The research carried so far has remained stand alone without much responsive, corrective, participatory or prescriptive role. In general the coordination among ICAR Research Complex, State Agriculture University, Officers/Departments handling MM-II, III & IV was found weak resulting in communication gap among the four MMs both at the planning and implementation stages.

4.4.8.24 The State governments in the North Eastern Region are besotted with the problems of resource constraint to provide matching shares for centrally sponsored programmes and lack of technically skilled and dedicated staff for field level coordination and monitoring.

4.4.8.25 The Mission is headed by the Horticulture Commissioner, DAC and its progress is annually monitored by the Central Steering Committee headed by Secretary, DAC. The focus and leadership required to run the Technology Mission as
a special purpose vehicle may get compromised by treating the Mission Director’s post as a routine post, without special staff and proximity to field required for running the Mission. A Directorate of Technology Mission was envisaged and till it comes to force, Small Farmers’ Agri Business Consortium (SFAC) is performing its role of monitoring & reporting progress. In fact, funds under MM II, III, IV are routed through Central SFAC/ State SFAC. This was required due to typical lag in the release of funds in the region and funding the required administrative staff within the government machinery. SFAC has hired technical and managerial staff at the State level to monitor MM II, III & IV. This gives flexibility to its operations.

4.4.8.26 While the Technology Mission may not be flawed in conception, a substantial coordination and backward and forward linkages amongst participating Departments and various stakeholders in the public and private sector is needed to achieve Mission objectives. This has not happened adequately with the existing set up

4.4.9 Remedial Measures

- Development of appropriate technologies, which bring about a strategic jump in production / productivity with full involvement of research agencies has to take place to make horticulture a commercially viable occupation for the stakeholders and improve their income and profitability.
- MM I needs to focus on creating adequate mother plant resources for supply to the nursery; Practices for production and post-harvest handling of passion fruits; evaluation of vegetable hybrids promoted by the private sector for their yield and resistance to the major diseases of the region; evaluation of variety / hybrids release by the public sector for their adaptability etc.
- Based on the various agro climatic zones in States, crops should be selected for specialization and promotional activities should be in tune with this.
- A ban should be in place on import of planting material from outside the region and the nurseries both in private and public sector should be regulated.
- All the States have low capacity of absorption of new technology and therefore required to be exposed to basics of crop production and management before getting into higher levels of technologies.
• The beneficiaries identified for area expansion should get thorough training in improved methods of planting and other recommended packages of practices before distribution of seeds/planting materials. The guidelines should be published in local languages. Proper record should be maintained of the beneficiary, status of the crop, yield per unit area, return obtained etc. These are essential for analysing the impact of the investment and technology.

• Instead of providing cash subsidy, coupons should be provided for acquiring inputs from authorised dealers.

• Processing capacity should be projected given the availability of raw material and expected demand. The processing unit should be sanctioned based on this broad calculation.

• Marketing is one of the biggest lacuna and for the disposal of the surpluses. The Second Report of NCF had recommended that a campaign can be launched for development of Rural Periodic Markets (RPMs), Seasonal Markets, Daily markets and PRIs controlled markets preferably through Mission. Specialized marketing Self Help Groups (SHGs), Small Farmers Enterprises (SFEs) and marketing cooperatives should be promoted to undertake Group Marketing, linking the produce directly with the consumer/buyer. The NER could be integrated with South and South East Asian economy for converting this remote and isolated Region into the main route for trade and economic linkage of mainland India with South and S-E Asia. Steps should be undertaken to formalize the huge informal border trade in the region. Progressively, value addition should take place in India, so that farmers could benefit more.

4.5 Technology Mission on Coconut

4.5.1 Traditionally, coconut was grown for edible oil. It served as an ingredient for various industrial applications too. The changed food habits and availability of other cheaper edible oils both in the edible and industrial sectors, however, have brought out a drastic decline in the use of coconut oil in these areas. During the last few years, on account of heavy imports of cheaper vegetable oil, especially of the Palmolein, the price of coconut oil has been depressed despite the large-scale price support operations undertaken. The Price Support Scheme could not make much impact in pushing up the price level and was not beneficial to the farmers as expected.
In this context, it was realized that only diversification of coconut derived products and value addition could help the coconut growers in getting remunerative prices. The coconut crop has also been affected by severe pests and debilitating diseases. It was realized that a major initiative should be started towards controlling the pests and diseases in coconut to improve its productivity and promote product diversification and better value realization from various coconut products, thereby helping the marginal farmers to optimize their income from coconut.

4.5.2 Technology Mission on Coconut was formally launched on 30.1.2002 and it is being implemented as a part of the Coconut Development Board’s ongoing programmes with the following objectives:

- To establish convergence and synergy among numerous ongoing governmental programmes in the field of coconut development in order to bring in horizontal and vertical integration of these programmes.
- To ensure adequate, appropriate, timely and concurrent attention to all the links in the production, post harvest and consumption chain.
- To maximise economic, ecological and social benefits from the existing investment and infrastructure created for coconut development.
- To promote economically desirable diversification and value addition to generate skilled employment.
- To disseminate technologies using participatory approach through demonstration and promotion to address the gaps in a mission mode.

4.5.3 Mission Components & Programmes

The Technology Mission covers four major components / programmes:

- Development and adoption of technologies for management of insect pests and disease affected coconut gardens.
- Development and adoption of technologies for processing and product diversification.
- Market research and promotion.
- Technical support, external evaluation and Emergent requirement.
4.5.4 Total Outlay for the Mission since 2001-2002 upto 31st March, 2005 amounted to Rs. 39.50 crores

4.5.5 Subsidy ranging from 25% to 100% of the total cost is extended to government /private institutions for Development and adoption of technologies for i) management of insect pest and disease affected coconut gardens ii) processing and product diversification and iii) market research and promotion.

4.5.6 Some of the major programmes initiated under this programme and achievements made so far are as follows:

- Establishment of 16 integrated Coconut Processing Units with infrastructure facilities worth Rs. 11.92 crores with a capacity to process 90 million nuts per year with financial assistance of Rs. 2.08 crores for value addition and bye product utilisation.
- Establishment of 4 Tender coconut Preserving and Packaging unit with a capacity to process 10 Million nuts per year.
- Popularisation of use of Packed Tender Nut water and other convenience foods.
- Establishment of a processing unit for Activated Carbon with an installed capacity of 5 metric tonnes per day.
- Creation of awareness on the health aspects of coconut products.
- Creation of awareness on eco-friendly and sustainable production system.
- Extension of opportunities for diversification of coconut products.
- Containment of Root Wilt disease with in the endemic area by preventing the spread by removal of 6.94 Lakh Root Wilt diseased trees from the border districts of Kerala and replanting with quality planting material and adoption of better management practices.
- Enhancement of market potential for coconut products both in domestic and international markets.
- Management of pests and diseases.
- Setting up of three nos. of Bio-control laboratories for the control of leaf eating caterpillar.
- Action initiation for establishing Quality Control Lab for coconut and coconut products for the first time in the country at Bangalore and Kochi.
• Creation of infrastructure facilities for farm level primary processing of coconut by installing 1500 copra dryers with a capacity to process 50 million nuts per year.

4.5.7 Constraints

(i) Difficulties faced by the State Governments in providing matching shares.
(ii) Reluctance of financial institutions for extending loan facility for setting up coconut processing units.
(iii) Violent fluctuations in the price of raw material viz. coconuts.
(iv) Apprehension about influx of coconut products at a much lesser price from Sri Lanka and other major coconut growing countries.
(v) Lack of price competitiveness of coconut products owing to high domestic price of raw material.
(vi) Lack of access to superior packaging technology act as bottleneck for coconut processing industries in the country.
(vii) Import substitute with cheaper products of similar nature for domestic use, greater competition for export and market share, inadequate market promotional activities, increased cost of production, improper labelling, non-uniformity of standards and improper packaging, not matching with consumers’ choice in price and package, inadequate shipping and shipyard facilities for storage, high freight charges and other related problems and the like will continue to pose threats and challenges.

4.5.8 Analysis

It appears that significant departures have been made from the original concept of a Technology Mission in the case of Coconut. The Technology Missions in other commodities have envisaged an end-to-end approach, which includes development and introduction of high yielding varieties and technologies, expansion of area, marketing and processing. Here, the entire focus is on disease control and product diversification. These issues may be having merit of their own in the context of coconut but whether Technology Mission is the most desirable way of achieving it is debatable. The functions of Coconut Development Board and Technology Mission also seem to be common and overlapping. This further dilutes
the essence of the Mission and renders it indistinguishable from the several ongoing Departmental programmes.

4.5.9 Recommendations

4.5.9.1 Technology transfer, motivation and capacity building at farmer’s level can be effectively done through Farmers Participatory Approach, Farmers Field Schools, forming coconut growers groups and exchange of ideas and technologies. Further, these farmers’ groups can be linked to market information so that they know the prices for their produce. This linkage should be available to all the villages and people should be trained to access such information. This automatically motivates the farmers to produce more if the prices are better.

4.5.9.2 These groups of farmers with adequate training and seed money coupled with micro credit facilities can go for farm level processing of primary products which in turn provide raw material for large scale production of coconut products. For example if the farm level processing as a group is producing husk, shell, coconut water and coconut meat, the bulk of raw material for further use are available at one place, it is easy to collect and transport to the big processing units. This can be a linked programme, which could be pro coconut grower and ensure public-private partnership for making coconut industry competitive. This programme could enable the coconut farmers or their groups to be shareholders in the large-scale process.

4.5.9.3 Coconut, a versatile crop, which yields innumerable products right from root to the tip of the palms, is known as “tree of life”. The prospects for coconut in the years to come are bright. Coconut can be processed as a food, drink, infant foods, pharmaceuticals, nutraceuticals etc.. As a green fuel, coco biodiesel, bio lubricants are also gaining momentum in various other countries. R&D will be required to identify and standardize the diversified products. Processing component will require lot of attention. Briefly, The Technology Mission would need to be redesigned with an end-to-end approach, if it is to be continued in view of its potential.

4.6 National Horticulture Mission

4.6.1 The National Horticulture Mission has been launched in the country during the current financial year (2005-06) for implementation with an outlay of Rs. 2300
crores for remaining period of Tenth Plan which will address the issues of production, post harvest management and marketing. With a budgetary outlay of Rs 13,300 crores (Rs. 11,000 cr. For Eleventh Plan) for the next seven years (remaining 2 years of the Tenth Plan and 5 years of the Eleventh Plan), the National Horticulture Mission (NHM) aims to double the national horticulture production to 300 million tonnes by the year 2011-2012. The focus area of the Mission is as under:

- Capacity building for production and supply of adequate quality planting material including setting up of scion banks of high yielding mother plants
- Increased coverage of crops under improved/high yielding cultivars.
- Enhanced production and productivity of horticulture crops.
- Strengthening of infrastructure facilities such as soil and leaf analysis laboratories, survey and surveillance of pest and diseases, green house, poly houses, micro irrigation, plant health clinics, vermin compost etc.
- Build adequate infrastructure for on farm and post harvest handling.
- Enhanced production of high value low volume horticulture products for exports.
- Strengthening infrastructure facilities for marketing and export.
- Enhanced production of high value processed products.
- Build a strong base to enhance efficiency in adoption of technologies.

4.6.2 Sanction for Rs. 314 crores for 12 States has been issued during current financial year (2005-06).

4.6.3 The Mid Term Appraisal of Tenth Five Year Plan for the Agriculture and Food Security sector has also commented on the National Horticulture Mission as under:

4.6.3.1 “Given climatic diversity, India has long run comparative advantage in horticulture. But despite appreciable production growth through area expansion, yields and produce quality remain unsatisfactory on international comparison. The National Horticulture Board and the Technology Mission for the North East run a number of schemes but major constraints remain, namely, senility of many existing orchards, non-availability of quality planting material, lack of strong extension machinery and inadequate marketing, cold-storage and processing infrastructure. The
Tenth Plan had proposed to double horticulture production by 2011-12 through a National Horticulture Mission (NHM) linking ICAR, DAC, Ministry of Food Processing Industries (MFPI) and the private sector. With area under horticulture already growing and responding to demand, no special effort (e.g. subsidy) is necessary to shift areas from existing crops. Rather the priority must be on technology to improve yield and quality and on post-harvest management, infrastructure and processing.”

4.6.3.2 It must, however, be said at this stage that even though Mid Term Review clearly speaks of priority on technology and in any case the Mission Mode is ideally suited for development and dissemination of technology in these times of knowledge based agriculture, the National Horticulture Mission somehow misses out the term “Technology” in its name. This gives the impression that unlike the Technology Mission on Oilseeds and Pulses and the Technology Mission on Cotton, the National Horticulture Mission is somewhat insipid on technology. This must not be allowed to happen.

4.6.4 Analysis
4.6.4.1 The National Horticulture Mission has taken off only recently and it would be premature to comment on its working. However, in a communication sent to the Planning Commission in January 2005, on the draft NHM, NCF had urged that the following facts and issues must be considered while firming up the design and implementation of the Mission;

- During the past 10 years, increase in horticulture production had occurred essentially through area expansion, whereas the overall productivity had remained low and even declined.
- The progress under the “Horticulture Revolution” has been skewed, both geographically and socially.
- The estimated post harvest losses in horticultural commodities continue to be at the level of 25% to 30%, valued at Rs. 20,000 crores to Rs. 80,000 crores, raising questions regarding the effectiveness of the huge investments made through the DAC, APEDA, NCDC, NAFED, MFPI etc. during the past 10 years or so for remedying this malady.
• Hardly 2% of the total horticultural produce is processed, and India’s share in the global market of horticultural products remains extremely low, about one percent.

4.6.4.2 A “business as usual approach” will not help to realize the goal of the Mission, especially the desired improvement in productivity and economic and ecological security. Our strategies and priorities would, therefore, need to be adjusted.

4.6.5 The key issues highlighted are as under

4.6.5.1 End-to-end Approach: The Mission should pay greater attention to “social engineering”, “inclusiveness” and “group dynamics”. In order to enhance the economies of scale for majority of small farmers, and to ensure end-to-end approach by integrating production – post harvest management – processing – marketing, Small Holders’ Horticulture Estates to institutionalise decentralized mass production by masses coupled with centralized services should receive high priority. Rural institutions such as PRIs, cooperatives, NABARAD and other banks (for credit flow), SHGs, KVKs and ATMAs must play a crucial role in production, processing, marketing, income generation, skill development and technology transfer and adoption. Appropriate mechanisms should be in place to ensure effective participation and contribution of these institutions. Highest priority should be given to the prevention of post harvest losses, processing, value addition, quality and marketing. From the very beginning, synergistic and holistic approach should be adopted to integrate production, quality, post-harvest management, processing, value addition, pricing, marketing, sustainability, profitability and equity. The worldwide concept of “Packing House” – a self-contained unit for cleaning, grading, sorting, packing, pre-cooling, storage, etc. of the fresh produce owned by the Small Farmers’ Horticulture Estate/Farmers’ Groups/Cooperatives should be adopted to link production with market. These “Houses” could also house agriclinics and soil and nutrient testing laboratories operated by Graduates (thus also promoting employment).

4.6.5.2 Capacity-building for Productivity Enhancement: Since our productivity is low and there are wide yield gaps, high attention should be paid to
increase per hectare yield and productivity through transfer and adoption of proven
technologies. Farm schools should be established and supported to promote farmer-
to-farmer learning. Demonstrations of high-density orchards, high-tech greenhouse
horticulture as well as low-cost greenhouse horticulture should be supported for
enhancing productivity and quality. There are serious research and technology gaps,
not only in production and quality but also in PHM, processing and marketing. These
gaps should be clearly identified for different settings and concerted effort should be
made to address them in a Mission mode. A strong information and database system
should support this venture.

Allocation of funds for establishment and renovation of tissue culture and leaf
analysis laboratories must be based on analysis of the existing facilities and location
specific needs. The past experience shows that adoption of drip/sprinkler
irrigation/fertigation has generally been subsidy driven, without arrangements for
certification and quality control which has brought bad name to this otherwise highly
acclaimed and proven technology. Appropriate monitoring and certification of
production and distribution of quality hardware components of micro irrigation should
assume high priority.

4.6.5.3 Critical Linkage: The Food for Work and Employment Guarantee
Programmes, should be used for area expansion of horticulture (e.g. in Maharashtra),
particularly in degraded and wastelands under integrated watershed development
programmes – a kind of asset creation. The funds thus saved should be redeployed
for further strengthening of the “humanware”, i.e. skilled human resources who could
move up in their employability and income and thus lessening the number in the
Below Poverty Line category.

4.6.5.4 Providing Services and Seeds: Greater support should be given to the
strengthening of services. Subsidy-driven horizontal expansion of horticultural area
should be a lower priority. It is unrealistic to expect diversion of sizable cultivable
area year after for new plantings/sowings of horticultural crops, as this will derail
production of staple food grains and commercial crops, thus jeopardizing food
security. A scientifically proven strategy would be required for adoption by each
State on priority basis for rejuvenating old plantations and replanting senile and
unproductive plantations.
Poor supply of quality planting materials is the key constraint and its redressal should receive the highest attention. Specialized women SHGs should be provided land in State Farms to produce seed and planting material of high value crops to obviate the constraint.

4.6.5.5 Accent on arid and semi-arid horticulture: Horticulture must play a pivotal role in enhancing and sustaining livelihood security in rainfed dry and semi-arid regions. In this context, rather than reinventing the wheel, the successful experience of horticultural revolution in Maharashtra, coupled with detailed analysis of national and international markets and trade, may be replicated in other parts of the country, with due adjustments based on location-specificity and avoiding the pitfalls encountered and other lessons learnt in Maharashtra.

4.6.5.6 Focused priorities: Given the multiplicity of horticultural species and the production, consumption and distribution settings, only a few high priority and wide-impacting programmes should be identified and implemented in each State through participatory approaches also involving private sector, NGOs farmers, rural institutions such as Panchayats, cooperatives and SHGs. Thrust should be on those areas and commodities, which already have a commercial base or have the potential to become commercial. Public-private partnership will be crucial for creation of cluster-based production, processing and marketing through Nucleus-Estate and contract farming systems. These aspects should be covered in the planning process itself.

4.6.5.7 Increase domestic consumption: In order to achieve the nutritional goal and also for price stability, domestic consumption of horticultural products should be increased. Social marketing, such as bulk vending of fruit juices in Mother Dairy depots and involving Home Science Graduates in establishing Health Food Markets, should be actively promoted.

4.6.5.8 A separate Mission on medicinal and aromatic plants: Considering the vast gaps and opportunities along the production-processing-marketing chain of fruits, vegetables and flowers, the National Horticulture Mission may concentrate only on selected species of these commodities, and even promote precision and protected horticulture. Recognizing the treasure of rich biodiversity, indigenous knowledge and
fast-expanding global market of botanicals, a separate National Mission on Medicinal Plants in association with the National Medicinal Plants Board will prove more effective. China, with no greater treasures on biodiversity than that of India, annually exports medicinal and aromatic plants valued at over US $ 50 billion against India’s export of less then US$2 billion, let alone the vast potential of employment generation and realization of Farmers’ Rights.

4.6.5.9 Mission management: The National Horticulture Mission is designed and planned to be implemented on the pattern of the on-going Technology Mission for the Integrated Development of Horticulture in the North eastern Region. The structure proposed in the Mission does not inspire confidence. The progress of the Mission in the North eastern Region has so far not been commensurate with the volume of investments. Therefore, it will not be prudent to follow the pattern of the NER Mission. There should be a stronger built-in mechanism for monitoring, evaluation and adjustments and a greater sense of accountability at all levels. In order to achieve convergence and synergy, the Mission capacity to comprehend technical issues and the ability to coordinate and implement through sufficient experience in the field and in the States should be managed by a full time Director, who should be a professional with a proven record of achievements, particularly in the commercial aspect of horticulture. He/She should be on contract for 5 years in the post and should have both authority and accountability. The Director of the Mission should be the Member Secretary of the proposed National Horticulture Council and the National Executive Committee. Treating the Mission Director’s post as a routine administrative posting will be a disaster.

4.6.5.10 State Governments: Horticulture being a State subject, the State Governments should agree to the Mission being operated on the model of a specific Mission, where all the links in the production, storage, processing, marketing and consumption chain function in an integrated manner.

4.6.5.11 National Horticulture Board (NHB): The National Horticulture Board was set up in 1984 on the recommendations of the ‘Group on Perishable Agricultural Commodities’ headed by Dr. M. S. Swaminathan. The Group had observed that different aspects of Horticulture Industry
were looked after by the various Departments/Organizations at the Central and State level. To coordinate the activities of these departments, and develop horticulture industry in an integrated manner with an end-to-end approach, it was felt necessary that a national organization should be set up. Under NHM NHB is setting up cold storages in selected clusters in the States. They also provide technical support for NHM schemes. The structure of National Horticulture Board (NHB) needs to be redesigned on the NDDB pattern.

4.7 Recommendations

4.7.1 Summing up, it is observed that there is a need for revival of the concept of Technology Mission and its potential for achieving productivity gains and higher incomes for farmers. NCF has also recommended the setting up of a Technology Mission on Sugarcane to bring the benefits similar to that reaped by oilseeds farmers in the early years of TMOP and for achieving end-to-end approach through infusion of technology and achievement of coordination amongst the stakeholders. However it is reiterated there is no use in having a faith in the concept of Technology Mission without bothering about its operational design. Technology Mission should be one, which is technology rich, and which is characterised by well defined outcome indicators and monitoring tools. It is also characterised by an end-to-end approach covering all subjects in the cultivation-consumption-commerce chain. Unfortunately, the Farm Technology Missions are tending to become subsidy rich and technology poor. Accountability has also been lacking and in the wake of inappropriate policy environment, the domestic production has stagnated and imports have increased. This has led to expansion in the distress of farmers particularly in the dry farming areas. The following ingredients therefore can be suggested as touchstone in the review of the existing Technology Mission and for the design of future Technology Missions:

(i) The target crop should have available technology with inadequate dissemination.

(ii) It should have the potential for generation of technology, particularly new seed varieties capable of providing quantum jump in productivity and practices for adoption in the field.

(iii) The Technology Mission created for the target crop should be a stand-alone entity with its own full time Mission Director who should have a fixed five
years tenure and who should be having substantial technical and administrative abilities not only to comprehend issues relating to technology but also to get them implemented in the field through coordination amongst departments and coordination with the States. Above all, he should be accountable for the success of the Mission. The Mission should have a Core Group of multi disciplinary posts which should be filled on contract for a period of five years from amongst participating departments / public / private sector/NGOs. Incumbents to posts must not be on routine deputation or should not be holding additional charge.

(iv) The work of the Mission should be divided into MM for research, dissemination of technology, marketing, post-harvest technology and trade policies. The research components must not only cater to technologies for production of the crops but should also tap technologies for post-harvest technology. Department of Biotechnology and CSIR therefore could be successfully utilised for inputs in addition to ICAR.

(v) In consonance with the observations in the Mid Term Review of the Tenth Plan (2002-07), it must be stressed that Research and Development of technology under a MM must focus on the need to enhance the income of the resource poor farmers. Further, the research must take into account the cost return factor. If the cost risk factors are low and returns are high, the technology would be easily adopted by the farmers even with minimal extension efforts. Further, agriculture research/technology should be gender sensitive by devising agriculture equipments, which are women friendly and which result in reduction of drudgery.

(vi) Above all, with the experiences of TMOP where trade policies adversely affected the outcomes, a MM on Trade Strategy would be necessary since external environment is as important for production and income of farmers as dissemination of technology.

(vii) The Mission should place greater stress on marketing efficiency and price signals in addition to infusion of technology and not so much on mere passage of subsidy, which have been the hallmark of normal departmental programmes.
(viii) Decision-making at the Central level should be in the hands of an Empowered Committee headed by Secretary, Coordination in the Cabinet Secretariat. The Mission Director should be the Member Secretary of the Empowered Committee and should report the progress every quarter to the Prime Minister’s Office and to Deputy-Chairman of the Planning Commission. Excessive reporting which may cut into the time available for work in the field / touring should be curtailed.

(ix) The MMs could be headed by Additional Secretaries in the concerned Ministries since the Secretaries may not have the requisite time to devote.

(x) Planning Commission should ensure active collaboration from the States through its powers to approve the Plan outlays of the States.

(xi) Frequent inspection of the fields to check the adequacy and timeliness of the Mission inputs for the farmers should be ensured to supplement the efforts of the regular staff of the Mission. Small multi disciplinary teams consisting of retired officials, scientists, farmers, NGOs and representatives of the industry should be constituted to broad base the monitoring efforts.

(xii) Concurrent evaluation for mid course correction would also be critical and should be done through independent institutions like AFC / NABARD / State Institutes of Administration / Industry Associations etc.

(xiii) Internal financial / release procedures should be specially designed for the Mission. It should also be necessary to ensure that Central assistance is not blocked up in the States in view of their ways and means problems. This can be achieved if the funds in the Mission are made available to it and are routed through organisations like SFAC etc and channelised through similar State level societies directly to the field level implementing agencies. Mission activities would have a propensity to degenerate into normal programmes if these special instruments are not made available to it from the beginning.

(xiv) Mission should have a term of ten years in order to ensure that they maintain their vitality as well as a time bound focus.

(xv) Farmers should be associated at all levels in the decision making and monitoring activities of the Mission since they are central to the existence of the
Mission. The key indicators in the work of the Mission should include priority to the growth of income of farmers.

(xvi) In the States, activities of the Mission should be reviewed in the State Planning Board, in order to ensure that the Technology Mission is not seen as a departmental programme of a single department but as a priority of the Government as a whole. The State Planning Board would be in the unique position to ensure participation of all the concerned departments through its control over their Plan proposal.

(xvii) Another key ingredient for the success of Technology Mission would be to make the watershed or the irrigation command area the point of convergence and integration of all relevant Technology Missions like those relevant to oilseeds, pulses, maize, cotton, horticulture, milk etc. Convergence and synergy among the numerous technology missions now in progress will improve their utility and impact and also help to reduce overall transactions costs. All the Missions could be integrated under an umbrella set up which could be called “National Federation of Farm Technology Missions”. Pulses and Oilseeds are important nutrition and income providing crops in rainfed areas and farmers in dry farming areas would continue to suffer in poverty and deprivation unless the proposed National Federation of Farm Technology Mission extends to them the necessary help at the right time and place. Such a National Federation of Farm Technology Missions should be chaired by a practicing farmer who has a proven record of unleashing the power of creativity in small farmers management. Its major aim should be to enhance farming productivity and agrarian and rural prosperity. Recommendations in this regard have already been made in the First Report of the NCF Chapter 1 Para 9 (d).

(xviii) It is important for on going and future Technology Missions to realize that it is not merely the increase in area production and productivity of target crops which should be the key objective. It is far more important to focus on increase in the income level of farmers since it is the face behind the production statistics, which should never be forgotten. There have been
examples where increase in production and productivity without adequate price support and insufficient demand has led to decline in the farmers’ income from the crops. This is a very undesirable way of rewarding the farmers for their increased expenses for use of inputs whose cost have risen and his increased efforts in the field for achieving productivity. It is perhaps due to insufficient attention to the income of farmers that around 40 percent of the Indian farmers are willing to move out of Agriculture if they have an alternative. It has been noted in the Mid Term Review of Tenth Plan also that agriculture is becoming uneconomic as a profession and technologies are needed which can enhance the farmers’ income, particularly for the resource poor farmers.

(xix) Since technology is at the core of technology mission, it is necessary that Technology Missions, both ongoing and future ones, effectively use technology driven communication methodologies for speedier and more cost effective dissemination of know-how for the farmers to enable them to cope with demands of knowledge based agriculture. Technology Mission thus can benefit all the farmers through use of Village Knowledge Centres to be set up at the village level. The concept of Village Knowledge Centres has been extensively elaborated and recommended in Chapter VIII of the First Report of the NCF. President A.P.J. Abdul Kalam has also opined recently that Village Knowledge Centres would act as a front line delivery system

(xx) Last but not the least, it should be realised that agriculture is an extremely important subject, allocated to the Panchayati Raj Institutions in the wake of the 73rd amendment of the Constitution. The centrality of the Panchayati Raj Institutions must be built in while formulating the Technology Mission. At the same time, it should be realised that this would be feasible only if and when the technical staff at the grass root level is placed at the disposal of the Panchayati Raj Institutions, which has unfortunately not happened uniformly in the country.

4.8 Technology Missions: Way Forward

4.8.1 To sum up, the Technology Mission is an efficient tool for programme design and implementation for achieving well defined production goals on a time bound and cost effective basis. The Mission mode method of programme design helps
to facilitate concurrent and adequate attention to all links in the production-
processing-consumption-marketing chain. It has built in methods of continuous
monitoring and evaluation, so that mid-course corrections can be introduced in
operational strategies when needed. For its success, the following important
ingredient identified by late Shri Rajiv Gandhi is fundamental – “We would like to
put one person in charge of such a Mission with full funding and with no restriction
on him whether bureaucratic or otherwise. The only limits will be certain
achievements, which must come within a certain timeframe.

4.8.2 NCF recommends that the existing organizational and managerial
structures, in the case of the Technology Missions in Cotton and Horticulture be
reviewed in the above context. During the early years of planned development in
India, Jawaharlal Nehru said, “I do not want reasons for failure; I want to know how
to succeed”. A Technology Mission has a national vision and need behind it. To
achieve success, the Mission will need a dynamic Mission Director who is known to
be an achiever. He/she should be in position for a minimum five-year period, so that
there is adequate time to achieve results. Authority, Accountability, and
Achievement, should be the basic management principles underpinning Technology
Missions.

The Chapter is based on written material received from various sources, followed by
individual discussions and a Consultation.

NCF acknowledges the valuable contribution by Dr. M.V. Rao and Dr. P.V. Shenoi,
the First and the Second Directors of the Technology Mission on Oilseeds
respectively and Shri J. N.L. Srivastava, former Director of the Mission and former
Secretary Agriculture, Govt. of India and the considered inputs from the Technology
Mission Directors and other senior officials from the Ministry/Departments involved
in the Technology Missions reviewed. NCF also expresses its gratitude to senior
officials from some States and NABARD for their inputs based on their field
experience.
EXECUTIVE SUMMARY

CHAPTER I – 2006-07: YEAR OF AGRICULTURAL RENEWAL

1. The inadequate progress in achieving the Tenth Plan targets in agriculture is well documented in the mid-term appraisal of Plan achievements by the Union Planning Commission. This has serious implications for not only food security, but also for rural livelihood security and for reducing hunger and poverty. In its first two reports submitted to the Union Minister for Agriculture and Food in December 2004 and August 2005, NCF has analysed the reasons responsible both for agricultural decline and farmers’ distress leading occasionally to suicides. Several suggestions have already been made to reverse this decline.

2. During the last one year, the Government of India has taken several significant steps to take the country once again on the path of rural prosperity and farmers’ wellbeing. These include the National Rural Employment Guarantee Act, Bharat Nirman, National Horticulture Mission and National Rural Health Mission. Several other important steps have been taken in the areas of credit and market reform. The time is therefore opportune for initiating during the Agricultural Year of 2006-07, an integrated programme for agricultural renewal. This programme designated “2006-07: Year of Agricultural Renewal” should consist of the following five mutually interactive and reinforcing action plans:

a. Soil Health Enhancement: Government Departments, ICAR institutes, Agricultural and Rural Universities, Fertilizer Companies, NGOs, Farmers’ Associations, Krishi Vigyan Kendras and Panchayati Raj institutions can undertake during the agricultural year 2006-07, a concerted soil health awareness and improvement programme. The programme should give concurrent attention to the physics, chemistry and microbiology of the soils. Both macro- and micro-nutrient deficiencies in the soil, as well as special problems like the occurrence of a hard pan in the subsoil and low soil organic matter content need attention. Every
farm family may be issued with a Soil Health Card to enable the family to monitor the biological productivity of their soils. Breeding soils for higher productivity may be initiated in the case of problem soils and waste lands. Community Land Care movement may be launched by Panchayats and training programmes may be organized for this purpose.

b. **Irrigation Water Supply Augmentation and Demand Management:** In addition to the steps proposed under Bharat Nirman, rainwater harvesting and aquifer recharge should be made mandatory. The conjunctive use of river, rain, ground, sea and treated sewage water should become a national habit. The cultivation of low water requiring but high value crops should be promoted in areas where water is a constraint. Low cost green houses for the cultivation of vegetables and flowers and for seed production may be promoted under conditions where evaporation exceeds precipitation. Efficient irrigation techniques like micro- and drip irrigation should be widely popularized. Watershed management should be linked to appropriate Technology Missions, so that the benefits of water can be maximized. Seawater farming involving coastal forestry and aquaculture could be promoted along the coast and in Andaman and Nicobar and Lakshwadeep islands. Water conservation and sustainable and equitable use should become everybody’s business. Water literacy and water quality management should receive attention from Panchayats.

c. **Credit and Insurance:** Credit reform holds the key to ensure the economic survival of small and marginal farmer families. Keeping in view the decline in the profitability of agriculture, and the farmers’ distress, the Government of India may consider providing support to the banking system for reducing the rate of interest for crop loans to 4 percent during the Year of Agricultural Renewal. Micro-finance should become livelihood finance by linking credit to essential support services so that credit becomes the pathway to sustainable livelihoods. An Agricultural Risk Fund should be established to provide farmers relief in the case of successive droughts or other natural calamities including disease outbreaks.
Kisan Credit Cards should be issued to woman farmers, even if the title to land is not in their names. Negotiable warehouse receipt is another urgent need. A Rural Insurance Development Fund and Credit Counseling Centres are needed. The Self Help Group movement can be strengthened by setting up at the Block or District level Self Help Group Capacity Building and Mentoring Centres. The Crop Insurance scheme needs to become farmer-friendly and the premium should be reduced. Crop insurance through SHGs can be promoted.

d. Technology: Technology is the prime mover of change. Both technology fatigue and technology gap should be avoided. This will call for revitalization of research, education and extension systems. It is suggested that all ICAR institutions and Agricultural Universities may commemorate 2006–07 as the Agricultural Technology Year. The major aim of this year should be to strengthen participatory research and knowledge management with farming families and the organization of about 60,000 Lab to Land programmes in the area of post-harvest technology and value addition to primary products. Biomass utilization and the creation of skilled jobs in the non-farm sector should receive high priority. Management procedures should be developed such as the organization of Small Holders’ Cotton and Horticulture Estates for the purpose of providing the power and economy of scale to small producers both at the production and post-harvest phases of farming. There should be income orientation to farming by promoting crop-livestock integrated production systems and improved post-harvest technology. New technologies like biotechnology and Information, Communication Technology (ICT) should be demystified and a cadre of Rural Farm Science Managers should be developed by training a couple of women and men members of every Panchayat/ local body in the management of new technologies, such as the establishment of refugia in Bt Cotton fields. ICT should be effectively harnessed to empower rural women and men through the Every Village a Knowledge Centre Movement.
e. **Market:** Market reform should begin with production planning so that every link in the cultivation-consumption-commerce chain receives adequate and timely attention. Farmers need proactive advice on land and water use based on potential meteorological and marketing factors. A National Land Use Advisory Service linked to State and Block Level Land Use Advisory Services may be established for this purpose. These can be virtual organizations with the capacity to provide land use advice on a location and season specific basis. The National Land Use Advisory Service should have continuous contact with IMD, ISRO, Agricultural Universities and Departments, Commodity Exchanges and Futures Market, APEDA, Commodity Boards and all credible national and international sources of information on domestic and international markets. The Land Use Advisory Service should cover crop and animal husbandry, horticulture, inland fisheries, forestry and agro-forestry and have the capacity to proactively assess potential surpluses and shortages of essential commodities. Attention is also needed to farmer-friendly contract cultivation practices.

3. To sum up, the National Agricultural Renewal Year programme of 2006-07, should deal concurrently with soil health enhancement, augmentation of the area under irrigation coupled with efficiency and equity in water use, credit and insurance reform, technology upgradation and dissemination, and farmer-centred marketing. The aim of the Agricultural Renewal Programme will be enhanced productivity per units of arable land and irrigation water, higher profitability, increased on-farm and off-farm employment opportunities and long-term environmental sustainability. Distress hot spots should receive priority attention.

4. **Establishment of an Indian Trade Organisation (ITO):** As a national self-empowerment measure, we should consider establishing an Indian Trade Organisation (ITO) and our own boxes for domestic agricultural support on the model of WTO’s Blue, Green and Amber Boxes. The value of our annual agricultural
production including livestock in 2002-03 was Rs. 5,60,516 crore\(^1\). The value of our exports of farm commodities in 2002-03 was Rs. 34,654 crores (6.18 % of total agricultural production)\(^2\). Thus only a small proportion of our agricultural commodities enter the global market, since with a population of over a billion, there is a large home market. Hence, we must segregate the very modest support we extend to our farmers into two groups – those which are of the nature of life and livelihood saving support to small farm families, and those which could be considered as trade distorting in the global market. The ITO can be a virtual organisation and should help to build a long term memory system in relation to home and external trade and help checkmate adverse global trade tends by stimulating timely action.

5. Launch of the Year of Agricultural Renewal Movement: This movement which will cover the crop year of 2006-07 should be launched on Baisaki day (13 April 2006) with the support of State Governments, Farmers’ Organisations, Business and Industry, Academia, Civil Society Organisations, Panchayati Raj Institutions and Mass Media. The year should end with the adoption by Parliament of a National Policy for Farmers, which will help to assure farm women and men that “Jai Kisan” is not an empty slogan. NCF will provide to the Ministry of Agriculture a draft National Policy for Farmers in April 2006, so that it can be widely discussed with farmers’ organisations during May-December 2006 and finally adopted before the 60\(^{th}\) anniversary of our independence.

6. The active involvement of State Governments and Union Territories is essential for accomplishing the goals of the Year of Agricultural Renewal programme. It is suggested that the programme may be discussed at meetings of the Agriculture Coordination Committee chaired by the Prime Minister, and the NDC Committee on Agriculture chaired by the Union Minister for Agriculture and Food. The programme should be initiated after careful planning from the 2006 Khariff season onwards.

\(^1\) National Accounts Statistics of India, 1950-51 – 2002-03, EPW Research Foundation, Mumbai, 2004
\(^2\) Agricultural Statistics at a Glance 2004, Ministry of Agriculture, Govt. of India
7. **Indian Farmers and Bharat Nirman**: To ensure the success of this massive rural infrastructure development programme the following four steps will be needed:

   i) **Consultation and Consensus** - this is essential in the case of bringing 10 million hectares of additional land under irrigation.

   ii) **Capacity Building** - At least one women and one male member of every one of the about 240,000 Panchayats/ local bodies should be trained to become Members of a Bharat Nirman Corps. The training of the Members of the Bharat Nirman Corps can be done by Agricultural, Rural and Women’s Universities, IITs and by appropriate NGOs, Farmers’ Organisations, NABARD and Financial Institutions and Business and Industry.

   iii) **Care and Management** - Gram Sabhas should be involved in providing oversight and advice in the area of maintaining and managing the costly infrastructure developed.

   iv) **Convergence and Synergy** - Steps should be taken to bring about convergence and synergy among other major social and human development programmes such as the National Rural Employment Guarantee Act, National Horticulture Mission and the National Rural Health Mission.

8. **Knowledge Connectivity**: Inclusion of knowledge connectivity as an integral component of Bharat Nirman, as recommended by NCF, is a welcome step. There is need for a forward looking policy with reference to community radio, since the community radio – internet/ cell phone combination can help us to travel the last mile in knowledge connectivity and reached the unreached. A far-sighted community radio policy which will be in keeping with the spirit of the Right to Information Act is the need of the hour.
1. **Science and technology are the engines of agricultural growth and development.** Green Revolution, built through synergy of technology, policy, services and farmers, ushered in 1968, resulted in tripling of foodgrains production (80% through yield enhancement), which more than halved percentages of hungry and poor people, enhanced employment and farmers’ income, and increased food self-sufficiency and national confidence. Today, however, India’s agricultural growth rate has slipped below the population growth rate. This has serious implications for economic growth, food security, equity and rural welfare.

2. Stubbornly high incidence of hunger and poverty, technological fatigue, serious yield gaps, huge post-harvest losses, decreasing net trade intensity, low and stagnant farmers’ income, declining holding size and widening rural-urban divides are matters of serious concerns. **There is consensus that the unfolding challenges of Indian agriculture can only be addressed through science and technology, and that a different R&D paradigm - a national innovation system integrating all facets of rural life and stakeholders would be necessary.**

3. Agricultural growth in recent years has thrown new sectors and regions into prominence. Livestock, fisheries, horticulture, specialty enterprises (spices, medicinal, aromatic, organic) and value-added products illustrate this trend. Market-driven diversification in a global perspective has become the new paradigm driving future agricultural growth. Rising capital intensity, particularly in the high-growth sectors of agriculture, has set in motion a new set of forces. Declining growth in public investments and eroding institutional infrastructure are other disturbing features of the current trend. World agriculture, particularly trade, places high premium on quality. Public health and food safety concerns are central themes of global regulatory negotiations. Indian
agriculture has to respond to these. Equally important are sustainability of natural resources (particularly water) and other environmental externalities including global warming and climate change.

4. Recent policy announcements have stressed the importance of investment in agricultural research as revealed by the following:

- The Common Minimum Programme of the UPA Government states, “The UPA Government……will ensure that **public investment in agricultural research and extension, rural infrastructure and irrigation is stepped up in a significant manner at the very earliest.” …… “will follow policies and introduce programmes that strengthen India’s vast science and technology infrastructure.”....

- The Finance Minister in his Budget for 2005-06, announced an initial provision of Rs. 50 Crore for operationalising a National Fund for Strategic Agricultural Research arising from Swaminathan Task Group.

**Overview of Agricultural R&D Infrastructure in India**

5. The National Agricultural Research System (NARS) comprises a network of Central (90), State (40) R&D organizations and coordinated research programmes (91). Agricultural R&D in the country owes its origin, growth, and sustainability to public support as **more than 85 percent of aggregate R&D funding comes from public exchequer. With more than 20,000 scientists and expenditure of Rs.31 billion, it is one of the largest systems in the world.** The ‘D’ component has been with the States, under the control of State departments of agriculture. Its isolation has not been successful and there has been a decline in the extension system across the board. Consequently, the centrally supported frontline extension system has grown covering frontline demonstrations and KVKs. The institutional edifice of the State R&E system continues to grow. The number of SAUs has grown from a mere handful in early seventies to 40 now. Unfortunately, funding levels have not kept pace with this and operational as well as scientific resources have degenerated.
6. **The rate of return on investment in agricultural research has averaged as high as 50 to 60 percent – one of the highest in the world.** Although there has been an increasing trend in R & D investment, it has flattened in recent years. Operational support, however, has not kept pace with overall trends. The problem has been serious in the State system whose share in the total R&E expenditure has consistently declined over the past four decades. The edifice is large in nominal terms. In relation to the size of the agricultural sector, however, investment intensity is low. **At 0.34 percent of agricultural GDP, research intensity is only half of the overall average for all developing countries (0.6 percent) and about one-sixth of the average for developed countries.** There is considerable inter-State variability in intensity of State funding (ranging from 0.08 in U.P. to 1.4 in H.P.). **With the exception of a few States, commitment to R&E is not strong and in some States the situation has deteriorated.** Dependence of State R&E on the Centre has grown.

7. For outreach programmes also, Central support has become more important. Priority accorded to agricultural R&D is revealed by the fact that this large network was built mainly from domestic resources. There has been a slowdown over the last decade or so and this is reflected in restraints on recruitment of scientists. This has been attributed to the overall policy thrust on downsizing public bureaucracy. Until the contours of a national policy on public R&D are redefined and clearly enunciated, managers of public finances will remain apathetic.

8. More than three-fourth of the scientific manpower resources are in States which account for half of the national R&E expenditure. With nearly uniform salary patterns, this reveals structural weaknesses - support per scientist is significantly lower in the State system (Rs. 0.84 Million against Rs. 1.72 Million). As attention shifts back to strengthening local R&D institutions, this dichotomy needs to be addressed. Matching human and other resources has not received adequate attention. **Two serious issues are decline in scientific manpower in the State system and stagnation in the Central system,** both of which have happened during the phase when the research agenda expanded and diversified. **This had consequences like loss of critical mass in research units and programmes resulting in decreasing scientific productivity and research**
impacts. Second, lower support per scientist in the State system does not auger well for the future, particularly since these scientists are expected to play a larger role in research outreach functions.

Major Challenges and Policy Directions

9. The challenge before us therefore is to build research and technology development capacities and partnerships which will contribute to and capture the impact of Gene Revolution and other scientific revolutions. For this the Commission recommends a three pronged approach:

- Prioritise strategic research and technology development programmes, including cutting-edge technologies, geared to meet the technological problems retarding and decelerating agriculture-led growth and development.

- Realize that science and technologies must have a human face and cannot operate in a vacuum. Therefore, it is absolutely necessary to formulate clear cut goals, policies, strategies and programmes and build partnerships for harnessing the (unlimited) power of science and synergizing technological and social resolutions.

- The National Agricultural Research System, the Technology Assessment and Transfer System, the Knowledge System (skill development, re-tooling, indigenous knowledge), the Humanware aspects, Enabling Mechanism (IPR, SPS) and Services must be synergistically aligned, restructured and revitalized.

10. Science and technology for crops, livestock, fish and forests, must address the following four interrelated areas in order to attain higher productivity and sustainability and thereby help alleviate hunger and poverty:

- Enhancing yield ceilings, bridging yield gaps, protecting yield gains, minimizing post-harvest losses, augmenting value addition and improving productivity and promoting eco-technologies rooted in the principles of ecology, economics, equity and employment;
• Exploiting the gene revolution (biotechnology), benefiting from information and communication technology revolution, space, nuclear and nanotechnologies and promoting **knowledge-based precision farming systems**, intensification, diversification and value additions;

• **Protecting and improving natural resources** (land, water and biodiversity), addressing environmental concerns, and managing climate change and natural disasters; and

• **Seeking congruence of productivity, profitability, sustainability and equity**, addressing gender issues and problems of the poor and the excluded, and managing liberalized trade in the globalized world by addressing issues related to global competitiveness in the context of the WTO AoA.

11. International quality and safety standards for agriculture products, including GMO related biosafety and biosecurity are very high. Meeting of their standards involves substantial costs for building technical and physical capability. There is a need for pooling talents and resources available in both public and private sectors to build this capacity. Finally **public research system should shoulder the responsibility to protect small farmers from ill-effects of trade reform process**.

12. With a view to bring special focus on women in agriculture, a **National Network of Women Scientists and Institutions** interested in engendering the development through S&T based interventions to develop an end-to-end approach, for the various agro-climatic zones, should be started. Such a national level action and policy research network should carry out longitudinal studies of women’s roles in agriculture and rural livelihoods in the various agro-ecological regions of the country.

13. **Participatory research and knowledge management** is the key to promote relevance and effective adoption of technologies and new information by pursuing holistic and system–based approach for converging “global” knowledge to tackle local problems. The unique nature of agriculture makes agricultural R&D different from other sectors and makes extension vital. The context is different and other providers are emerging. A new ball game has been set up and our response has remained outdated.
Clear enunciation of the roles of the Centre, States, local bodies, Panchayati Raj Institutions, private sector, and NGOs in a client-centred R&D structure is a critical task. Critical scientific and resource mass and modern management must back the human resources and research – extension – farmer – market – consumer linkage.

Recommendations

14. In line with the Central Government’s decision to establish a National Science Education and Research Foundation and allocation of Rs 1000 Crore for commencing two institutions to serve as flagship institutions of science to render India as a strong knowledge society, the National Commission on Farmers recommends a provision of Rs. 1000 Crore as a one–time grant to NARS to bridge the critical gaps in scientific infrastructure in frontier areas of technologies, so as to enable the Nation to enhance its agricultural competitiveness and to benefit from science–led Second Green Revolution. This additional allocation will particularly strengthen work on conservation and improvement of livestock heritage of the Nation, genomics, bioinformatics, bioremediation and harnessing gene–richness of microorganisms, biomass utilization, value addition and use efficiency of plant nutrients and water. A National Board for Strategic Research in Agriculture may be set up to coordinate and harness advances in basic science for agricultural progress. The ICAR should position itself to effectively utilise the available funds and additional funds allocated to the NARS.

15. The NARS covers the entire spectrum of crop, fishery, forestry, natural resources and agro processing and agri-business. However, there are gaps in several areas awaiting redressal or are not receiving focused attention. Some of such areas, as listed below, require more intensive and inter-disciplinary attention.

- Climate Change and its implications
- Harnessing space, ICT, nanotechnology and other frontier technologies for precision farming
- Organic recycling and value addition to biomass, biofuels and bioenergy
- Crop livestock-fish integrated production systems
- Pre-breeding and participatory breeding
- Scientific organic farming.
16. The Commission recommends setting up of new National Centres / Institutes in the above areas or mandate existing ones to address those areas specifically. Such institutions could be set up in existing ICAR institutes or SAUs or institutes of other relevant Ministries but should be functionally and financially autonomous with their own Governing Boards. In the Commission’s view, the institutions should be built around outstanding scientists and research leaders of proven capability in these fields. Such committed research leaders should be first identified and involved in the project design process. The National Challenge Programmes (identified by the Task Group and other committees) should likewise be led by scientist–achievers.

17. The premier research institutes, such as IARI, IVRI, should be designated as Institutions of National Importance. The Commission recommends that such institutes should be given special funds and organizational and management supports to empower them to enrich the Indian agricultural knowledge system necessary for enhancing country’s competitiveness at the global level on one hand and to serve the majority small and marginal farmers, often inhabiting vast rainfed drylands and other poorly endowed non-congenial agro-climatic regions, on the other hand. A National Council for Global Leadership in Agricultural Science and Education should be set up under the chairmanship of the Minister for Agriculture to give guidance to these new initiatives and to position India as a leading player in international agricultural R&E system.

18. It is strongly recommended to increase the R&E intensity to 1.0 percent (from current level to 0.34 percent) of AgGDP. The existing serious imbalances in funds allocations to different agro-ecological regimes and commodities should be corrected by allocating larger proportions to eastern region to harness the high untapped agricultural growth potential, as also to rainfed arid and semiarid drylands and to livestock and fisheries subsectors. The resources recently allocated to the National Horticulture Mission need to be aligned to priority areas for technology development for prevention of post–harvest losses, processing, value addition,
development of specialty varieties (viz. for processing) and production and distribution of quality planting materials.

19. A package of reforms aimed at enhancing autonomy, improving decentralization and devolution of power, and improved financial management through built-in monitoring and evaluation is required. Both ICAR and SAUs should commit themselves to such reforms. Support of high level policy makers at both the Central government and State government levels is needed to implement this far reaching reform agenda.

20. The following additional policy reforms by Central and State Governments are recommended:

- Balance expenditure per scientist in SAUs at par with ICAR.
- Maintain critical levels of scientific and resource mass in different ICAR Institutes and SAUs.
- Enhance share of operational expenses of scientists.
- Dedicate adequate public funds to promote basic and strategic research as well as to develop human capital.
- Promote competitive funding for networking, institutional reforms, addressing R&D challenges.
- Strengthen project-based funding with clearly defined outlay-outcome matrix on the lines of The Log Frame Options.
- Evolve National Innovation System aligning policy, incentives and regulations to foster innovation and entrepreneurship.
- Establish Genius Awards for young scientists to attract talented youth to agricultural research, technology development and education.
- Strengthen IPR regime for technology transfer, resource generation and evolving competitive market with due provision for social inclusion in access to new technologies.
21. **Codes of Conduct** should be introduced for public-private sector partnerships based on respect for each other’s obligations, where IPR, breeders’ rights and other forms of proprietary control over technologies and products of commercial significance, are important. The code of conduct should be developed through extensive consultation among all partners and can be used in the entire national scientific research system.

22. In order to promote investment in agricultural research by private sector, the following suggestions may be considered:

- **Provide tax concessions** and **tax holidays** to promote private sector’s contribution to R&D from 14 percent to 33 percent.
- **Strengthen regulatory mechanisms**, especially IPR, SPS and quarantine facilities, to promote technology acquisition.
- Encourage testing of private sector’s new varieties and other technological products by public sector regional and national testing programmes.
- **Undertake joint research activities** with clearly defined responsibility and accountability of and profit sharing by various partners.

23. SAUs are generally starved of operating funds and now largely depend on ICAR. The shortage of funding in the SAUs has had adverse effects on human resources development, research infrastructure, and linkages with farmers. There is an urgent need to sensitize policy makers at the State level to the payoffs to investing in research. At the same time, the Central Government might develop a funding formula that supports the weaker States, but provides incentives to stronger States to increase their **funding** (e.g., matching grants). A key role of Central research is to generate spillovers to enhance efficiency in State research programmes.

24. In order to enhance effective technology transfer and to bridge the yield and other performance gaps at various levels, the Commission recommends the following:

- Convert the Krishi Vigyan Kendras into **Krishi and Udyog Vigyan Kendras** in order to give concurrent attention to on-farm and off-farm livelihood and to
promote end-to-end approach and to link production with marketing and consumption.

- Establish 50,000 **Farm Schools** in the fields of farmers-achievers to spread proven technologies through farmer-to-farmer learning.
- Integrate the activities of KVKs, ATMAs (Agricultural Technology Management Associations), Lab-to Land and Land-to Lab programmes, Self Help Groups, agricultural cooperatives and other grassroot institutions.
- Establish **National Participatory Research, Demonstration and Training Centres** to integrate available scientific institutions, extension programmes and grass-root institutions related with agricultural development including the proposed initiatives, namely, Farm Schools, Soil Health Cards, Kisan Credit Cards, Agriclinics and Agribusiness centres.
- Establish a **National Council of Innovative Farmers** to provide a structured opportunity for sustained scientist-farmer dialogue.
- Establish National and local level **Science and Technology Alliances (Consortia)** for rural livelihood security.
- **Increase the involvement of small holders in public-private partnership in high-value agriculture** by integrating the small-holders with the high-value agricultural and supply chain and making necessary provisions for remedying market failures and **structuring the SFEs on the NDDB model**.

25. The recommendations of the **Swaminathan Task Group on Revamping and Refocusing of National Agricultural Research** to meet current challenges and those of the **Mashelkar Committee on Reorganization of ICAR** should be examined and the accepted ones should be implemented without further delay.
Executive Summary

CHAPTER III - TOWARDS AN INDIAN SINGLE MARKET

1. Trade is an important sector of the economy. The share of internal trade in the Indian economy in 2001-02 [advance estimates] stood at around 13.4% of the GDP. It employed about 36 million people, a majority of whom were self-employed, engaged in retail and wholesale trade. It is the most important sector in the tertiary/service sector. However, internal trade faces many problems due to the diversity of controls exercised by multiple authorities at different levels, restrictions of inter-State and inter-district movement of goods, lack of uniformity in standards laid down by different authorities and agencies and in taxes. As a result, the price strategies get affected by differential tax rates and become localised. All this has led to breaking up the vast India Market into a large number of smaller regional markets. The paperwork involved in complying with the various controls, regulations and licenses, the costs involved in terms of time and resources and the inevitable corruption and malpractices that this leads to, have served as a big drag on the efficiency of trading operations in the country.

2. The Hon’ble Prime Minister of India, Dr. Manmohan Singh has recently observed as under:³

“The time has come for us to consider the entire country as a common or single market for agricultural products. We have to systematically remove internal controls and restrictions.”

3. With a view to benefit from the international experiences, the FAO at the request of the National Commission on Farmers, through the Government of India, Ministry of Agriculture, studied the European Union Market integration experience and looked into the legislative, political and economic measures taken during the process. The European experience is documented in the study mainly to understand the political processes and the economic measures that led to the adoption of a common and eventually a single market in that region. The Report has since been received.

³ Agriculture Summit, 2005
4. The barriers to internal trade in India could be grouped under the following broad heads:
   [a] Restrictions imposed by the Essential Commodities Act [ECA], 1955/Prevention of Food Adulteration Act, 1954, etc.
   [b] Fiscal issues
   [c] Transport related
   [d] Agriculture trade related

**Essential Commodities Act, 1955 and other Acts/Orders**
5. Using the powers under ECA, 1955, the various Ministries/Departments and the State Governments/UTs have issued a large number of control orders covering items such as paddy/rice, edible oils etc. The ECA, 1955, and the Control Orders were relevant and issued in situation of demand exceeding the supply. The demand-supply balance and the economic environment have changed in recent years but the restrictions and controls are continuing and coming in the way of efficient functioning of the marketing system and also the agricultural development in the country.

**Suggestions**
6. The number of essential commodities has been reduced from a high of seventy in 1989 to only fifteen. It would be useful if the remaining agricultural product are also removed from the list of essential commodities. Alternatively, the ECA, 1955, may be put under suspended animation for the present and revived by Government notification if any emergency situation develops, for a limited time, for a specific commodity and in a specified area. After watching for a few years and being satisfied that under the changed environment it is possible to tackle even emergency situations with market operations, it may be possible to scrap the Act all together. Further, to ensure that the States do not issue fresh control orders, the Central Government may consider the feasibility of making Central legislation to ban imposition of any restriction in the movement, stocking etc. of agricultural commodities. In any case, the powers of the Government to restrict the movement of goods out of their territory are incompatible with the principle of a single market.

7. The proposed **Food Safety and Standards Bill [2005]** would repeal the outdated Prevention of Food Adulteration Act, 1954 and the concerned control orders issued by various departments, and create a streamlined framework. The Food Regulatory
Authority of India [FRAI] envisaged under the proposed Bill, would be the supreme authority for standard setting and enforcement in food sector against the present situation where a number of Ministries are involved in matters concerning food and food processing.

**Fiscal Issues**
8. Fiscal reforms are important in facilitating the growth of efficient trade. There exist various forms of charges/taxes on the traded commodities in India. There are considerable variations in the market charges and taxation rates across the States. The complex tax structure and multiplicity of State-level taxes distort the process of trade. Inter-State and Centre-State harmonization of tax law and administrative procedures could facilitate the simplification of the tax system. Further the multi-point tax system in India has cascading effect on prices.

**Suggestions**
9. Efforts have for be made to introduce the Value Added Tax (VAT) in all the States. The State VAT may, in due course be replaced by National VAT, once there is an agreement between the Centre and the States regarding sharing of the tax. The octroi or any other local tax introduced by any State needs to be abolished. If however, for revenue reasons the octroi etc. cannot be abolished in all cases, at least the primary agriculture produce should be exempted from their coverage.

10. Another approach could be the abolition of all indirect taxes on agricultural products as a policy that would not only resolve the problem of border taxes but would also be socially more equitable. A possible measure for compensating the States for loss of revenue could be to increase the devolution of funds from the Centre to the States most affected by incomes foregone. Another suggestion particularly relevant for compensating the loss of revenue could be the increase in VAT rate on processed and semi-processed products by say 0.5% or raising the tax say on petrol, by 0.5% to generate additional incomes to compensate loss of revenue by abolition of octroi, Central Sales Tax etc.

11. An important step could be to change the administration of taxes so that no border checks etc. are needed. Most of the physical barriers on primary agricultural
commodities at the State borders are on account of collection of sales/purchase tax or APMC cess or Octroi.

**Transport related**

12. Commercial vehicles moving across the borders face a multiplicity of checks from different authorities relating to road tax, license fee, payment of excise/VAT, Essential Commodities Act, forest conservation, pollution control, etc. Further the transport vehicles are required to obtain ‘fitness certificate’ and pay road tax on an annual basis. For movement beyond the State, the transport vehicle owner has to apply for ‘National Permit’ covering at least four States and is required to pay the road tax and permit fee for all the States concerned. The rate of road tax in different States is different. Further, the appropriate authority at the checkpoints reserves the right to stop and detain the vehicles, which significantly adds to the cost of transportation. The interruption of the trucks/transport vehicle could be on various grounds and it is quite possible for a particular vehicle to face detentions on each of them, increasing the transaction cost substantially and hurting internal trade especially in perishable products.

**Suggestions**

13. To simplify the arrangements, it is suggested that a uniform amount may be charged for the National Permit and the permit holder may be allowed to ply the vehicle anywhere in the country. Similarly, the system of annual fitness certification and road charges may be replaced by a lifetime charge assuming around ten-years life for a transport vehicle. For plying the vehicle beyond the above limit, the vehicle may be subjected to an annual fitness certification and payment of fee etc. Further, the centralization by truck operators is common which effectively bars entry of new players in the transport sector. This aspect leads to be studies and appropriate measures be derived to remedy the situation.

**Agriculture Trade Related**

14. The wholesaling of agricultural produce is governed by the Agricultural Produce Marketing Acts of various State governments. Once a commodity is notified, the APMC Act makes its transaction mandatory in the regulated market. APMCs have generally
failed to provide adequate infrastructure at the *mandis*. Further, the focus of the APMCs has been on regulation and not development of markets for the local products, introducing grading and encouraging local processing etc. The APMCs have also not played any significant role in bringing better market information to the farmers. It is felt that direct marketing could enable the farmers to sell their produce to the processors or bulk buyers at lower transaction costs and maybe at better prices than what they get from intermediaries or from the wholesale markets in the regulated markets.

**Suggestions**

15. In order to improve the transparency in the operation of the APMCs, it may be made obligatory for them to publish the daily arrivals, maximum and minimum prices and the balance of stock available. Availability of this information on the internet for all APMCs on a day-to-day basis could be the first step to develop an all India market. The monopoly of the APMCs has meant that the private sector including cooperatives have not been able to contribute towards developing and building up marketing infrastructure in the country and the farmers have been denied choice. The Ministry of Agriculture, Government of India have already formulated a Model Act on Agricultural Marketing incorporating the necessary reforms and circulated it among the States for suitable amendments in their respective APMC, Acts. However, the **Model Act would require a relook if all barriers to internal trade were to be removed.** There is also a need is to promote alternative and mega markets especially near the big cities and metropolitan towns outside the purview of the APMC Act.

**Supporting Measures**

16. A host of supporting measures would be needed to ensure that the benefits of the Indian Common Market reach the farmers and the consumers and are not appropriated largely by the traders/truckers etc. Some of the supporting measures needed are:

- Standardization and harmonization of the quality standards
- Policy support in creation of farmer communities/groups etc.
- Need for development of suitable agriculture credit policy framework for increase in investment credit, financing to farmers’ groups/communities and new agri-business opportunities.
- The development of instrument based secondary market of negotiable warehouse receipt system.
- Attending to food security related concerns- increased employment opportunities, improved PDS and establishment of Grain Banks in areas with difficulty in access.
- An orderly functioning commodity forward market with orientation towards improving farmers’ access.
- Improved market information
- Development of infrastructure and connectivity.

**Conclusion**

17. In FAO terminology, India is nearly a ‘Common Market’ as there are no customs duties and presently no absolute quantitative restrictions in movement of goods from one State to another. However, several steps are required to make it a Single Market. The need is to build over the developments already made like the introduction of Value Added Tax (VAT) by many States, introduction of the Food Safety and Standards Bill and the Warehouse Receipt Bill in Parliament, circulation of a draft Model APMC Act to facilitate amendment of the APMC Act by the States and reduction in the number of commodities covered under the Essential Commodities Act 1955. The need now is to expedite introduction of State VAT in the remaining States, introduce uniformity in taxes on commodities, withdrawal of octroi and other local taxes, replace annual payment of road tax and renewal of fitness certificate by a life-time (atleast ten year) payment/system and introducing a National Permit for plying commercial vehicles anywhere in the country. The tax administrations also have to change so that the border check posts are not used for collection/verification of payment of taxes. The above changes would need building a consensus and constant persuasion in our federal system. The matters relating to revenue sharing/compensation for loss of revenues to the State Governments, etc. may be referred to the Finance Commission for suggesting methods by which Indian Single Market may become a win-win situation for all.
CHAPTER IV – TECHNOLOGY MISSIONS: WAY FORWARD

1. Technology Mission was conceptualized by late Shri Rajiv Gandhi, former Prime Minister of India in 1986 and designed and pursued by Shri Sam Pitroda. Five Technology Missions, including Technology Mission on Oilseeds, were launched. The key element of the Technology Mission approach involved effective transmission of available technology even while encouraging research on newer technologies, an end-to-end approach to meet all the requirements of the farmers in an integrated way, an effective coordination amongst stakeholder departments / organizations and the State Governments.

2. The Missions were, therefore, designed to be technology rich, paying due attention to its transfer for increasing the productivity of the crops grown by the farmers and also focusing on post harvest and processing issues. They were expected to be driven by dynamic and knowledgeable Mission Directors supported by full funding and dedicated staff. The Mission had to deliver identified objectives within a certain time frame and they were to cut across several Ministries with their own coordination hassles. Above all, there had to be an appropriate policy environment to protect the income of farmers.

Technology Mission on Oilseeds & Pulses (TMOP)

3. Since oilseeds were identified with a yield gap and since India had the advantage of a diversity of soils, climate, research and development infrastructure, oilseeds were chosen as a fit case for being targeted through a Technology Mission. Rising demand for edible oil, and insufficient use of technology for optimum oil extraction and rising import bills for edible oil were some other reasons for the need to enhance oilseed productivity through a Mission. Pulses were added as a target crop to the TMO in 1990 and a Technology Mission on Maize was also ordered in 1996 consequent to the early success of the TMO.
4. The Mission was set up with a full-time Mission Director and was operated through four Mini Missions dealing with crop technology and research, farmer support system, price support processing, storage and marketing and post harvest and processing technology. Seventeen different agencies were involved in various activities of the Mission and a bottom up participatory approach was followed along with a scheme of incentive prices for various oilseed crops to encourage the farmers.

5. This cooperative, coordinated approach with a sense of ownership and commitment by all partners was a major reason for the initial success of the TMO. The target was to raise oilseed production from 12.4 million tonnes to 26.0 million tonnes and vegetable oil production from 3.6 to 8.0 million tonnes by 2000 AD.

6. The initial results were heartening in that by 1998-99, the production rose to 24.75 million tonnes and the yield rose from 570 to 944 kgs. per hectare. The solvent extraction technologies, the conversion of hullers to shellers and rice bran extraction technologies also developed well, and led to substantial reduction in edible oil import bill by 1992-93.

7. The decline, however, set in with the decline in political direction from the Centre and in the States for the Mission consequent to the demise of Shri Rajiv Gandhi and departure of Shri Sam Pitroda. Simultaneously, the clamour of urban consumers for cheap edible oil, declining international prices, policies of liberalization leading to placement of edible oil under Open General License and reduction in bound rate for crude and refined soybean down to 45%, led to a severe adverse effect on the efforts of the oilseed farmers towards self-sufficiency. Briefly, therefore, the trade policy worked counter to the stated goals of the Technology Mission leading to the Mission being wound up with the beginning of the Tenth Plan. It was recognized at the highest level that the Technology Mission with its existing structure could not deal with major issues relating to procurement price and trade policies and, therefore, had obviously outlived its utility. The Government, however, reaffirmed its commitment to oilseeds, pulses and maize as important crops for small and marginal farmers in resource-poor conditions by launching a comprehensive and Integrated Scheme for Oilseeds, Pulses, Oilpalm and Maize (ISOPOM) with increased outlays and greater flexibility and involvement of the
private sector. Summing up, the Technology Mission displayed its capabilities in the early years when it was treated as a special-purpose vehicle with close monitoring and suffered its demise only because of reduced political and administrative direction and adverse trade policies. Therefore, a Mini Mission on Trade Strategy would be necessary since external environment is as important for production and income of farmers as dissemination of technology.

**Technology Mission on Cotton (TMC)**

8. Cotton is an extremely important commercial crop, providing livelihood to 60 million people depending on its cultivation, processing and textile trade and also provides raw materials for 1500 mills, 4 million handlooms and 7 million powerlooms. In view of lower yields and poor lint quality of cotton, TMC was launched in February, 2000 in 13 States. It was operated through four Mini Missions focusing on research, enhancement of production and productivity, development of market infrastructure and modernization of ginning/pressing factories. The Tenth Plan outlay is Rs. 568 crores consisting of Rs. 20 crores, Rs. 355 crores, Rs. 108 crores and Rs. 85 crores, respectively, for the four Mini Missions (MM). TMC has succeeded in producing 232 lakh bales during 2005 against the target of 215 lakh bales by 2007. However, merely good yields cannot prove the efficacy of MM-I and II since good prices, higher productivity through Bt. Hybrids and increased involvement of cotton mills in private sector for technology transfer have been equally responsible. MM-II should have resulted in quantum jump of supply of seeds of open pollinated varieties and adoption of INM/IRM/IPM technologies beyond project areas, which has not happened.

9. It is further noted that the four MMs have often operated in seclusion without observable linkages and integrations. Some States have also not contributed their share of the budget. TMC does not have an independent full-time Mission Director and there is no additional staff in support. TMC is, therefore, reduced to a routine departmental programme. Consequently, the periodicity and quality of inspections has suffered. The close monitoring of the early years of TMO is missing and there appears to be excessive reporting, leaving lesser time for field visits. No special procedures have been devised for release of funds to the States, leading to delays in the passage of funds to the field and this has worked adversely for time-bound field operations for cotton. In general, while
MM-I and II leave room for improvements, MM-III and IV have performed fairly well due to multi-stakeholder involvement and creation of a Cell in the Cotton Corporation of India (CCI) exclusively for MM-III and IV under a professional. In particular, MM-IV has benefited through operation of a single window system, demand for cleaner cotton through premiums and preference given by CCI to modernize units for processing its stocks. It is, however, felt that production and productivity of cotton can go up further, if the consumption of cotton in the mills rises. While the Technology Upgradation Fund of the Ministry of Textiles has benefited the mills, a lot can still be done beyond the stage of ginning. The real challenge lies in enhancing the quality awareness amongst farmers and ensuring transparent and scientific marketing as well as modernization at all stages of ginning, pressing, spinning, weaving etc. TMC can help through frequent interactions amongst farmers, NGOs, scientists and mills. It would be useful to set up National Cotton Council with participation from all major stakeholders under the chairmanship of Union Agriculture Minister.

Technology Mission for Integrated Development of Horticulture in North Eastern States, J&K, Himachal Pradesh and Uttaranchal (TMHNER)

10. TMHNER comprising four Mini Missions was set up with an objective to achieve Convergence and Synergy among numerous ongoing governmental programmes, timely and concurrent attention to all links in the production, and maximizing economic, ecological and social benefits and to promote product diversification and skilled employment.

11. A total of Rs. 453.36 crores were allocated for the Mission since inception in 2001 with more than 90% accounted for area expansion and creation of market infrastructure. So far the Mission has achieved limited success in area expansion, setting up of marketing infrastructure and a few processing units.

12. A review of the Mission activities shows a large gap between original concept and actual implementation in the field. Each MM is working independent of the other under the control of their respective administrative agencies. Linkages among the four MMs are weak both at the planning and implementation stages. The Five ICAR Institutes / Centres involved in implementing the R&D programmes of Mini Mission I in the region have
failed to provide assistance in need based research. The States in turn had not consulted the ICAR for the varieties/hybrids recommended for area expansion under MM-II suggesting weak linkage between MM-I and MM-II.

13. Allocations under MM-II for expansion of area under horticulture should have been made with an agro-ecological/comparative advantage approach. Besides the Mission should have disbursed subsidies with greater attention to choice of varieties, quality and sufficiency of planting material, field monitoring etc. Assistance for costly and highly technical units like tissue culture labs should have been provided after careful need assessment. Under MM-III, Infrastructure for Post Harvest Management (PHM) including marketing and processing need greater attention.

14. So far, only 9 units have been set up under MM-IV out of which two are upgradation ventures. Besides raw material shortages, the food processing sector faces a host of problems like poor infrastructure, credit, institutional factors like land tenure and inhospitable terrain etc retarding its development. This may lead to a serious mismatch between MM-II and MM-IV.

15. While the Technology Mission may not be flawed in conception, greater attention is needed for coordination and backward and forward linkages amongst participating departments and various stakeholders in the public and private sector at the Central, State and lower levels to achieve Mission objectives.

16. Several remedial measures have been suggested to bring the Mission activities on track which include: creation of adequate mother plant resources, specialization based on agro climatic zones, training and demonstration for beneficiaries, provisions of coupons for input purchase instead of cash subsidy and greater attention to marketing including border trade.

**Technology Mission on Coconut**

17. Technology Mission on Coconut was established in 2002 as a part of the Coconut Development Board’s ongoing programmes with diversification of coconut derived products, value addition and remedy for severe pests and debilitating diseases as its focus, thereby helping the marginal farmers to optimize their income from coconut. It appears that significant departures have been made from the original concept of a Technology
Mission in the case of Coconut. The Technology Missions in other commodities have envisaged an end-to-end approach, including development and introduction of high yielding varieties and technologies, expansion of area, marketing and processing. Here, however, the entire focus is on disease control and product diversification. These issues may be having merit of their own in the context of coconut but use of Mission vehicle to achieve these objectives is debatable. Technology transfer, motivation and capacity building at farmers’ level through a participatory approach involving farmers’ field school, coconut growers group etc. and linkages to market information would be necessary. Micro-credit with promotion of farm level processing leading to large scale processing through public-private partnership can lead to a more competitive coconut industry and more profitable share holding of farmers’ groups.

**National Horticulture Mission**

18. National Horticulture Mission (2005) addresses the issues of production, post harvest management and marketing. With area under horticulture already growing and responding to demand, focus should have been on infusion of technology to improve yield and quality and on post-harvest management, infrastructure and processing. It is observed that the National Horticulture Mission somehow misses out the term “Technology” in its name. Adequate attention should be paid to address low productivity, tremendous post harvest losses and insignificant presence in the world horticulture markets. A business as usual approach will not help. Instead, highest priority should be given to the prevention of post harvest losses, processing, value addition, quality and marketing. From the very beginning, synergistic and holistic approach should be adopted to integrate production, quality, post-harvest management, processing, value addition, pricing, marketing, sustainability, profitability and equity. All these could be done with the help of small farmers horticultural estates, packing houses, stress on capacity building and adequate provision of seed and services.

19. The Food for Work and Employment Guarantee Scheme should be used for expansion of area under horticulture. In order to achieve nutritional goals and also for price stability, domestic consumption of horticulture products should be increased. There should be a full time Mission Director. A separate Mission on Medicinal and Aromatic
Plants should be set up. National Horticulture Board (NHB) should run on the lines of National Dairy Development Board (NDDB).

**Recommendations**

Considering the original concept of the Technology Missions and the experience gained in formulating and operating the various Missions, the following recommendations are made:

20. Technology Missions should avoid becoming subsidy rich and technology poor. They should be characterized by well defined outcome indicators and monitoring tools. There should be a defined and end-to-end approach covering all subjects in the cultivation-consumption-commerce chain. Mission should be a stand alone autonomous entity with its own full time dynamic Mission Director who should be an achiever and accountable and have a supporting core group of multi-disciplinary posts, which should also be filled up on contract for five years not only from departments but from public/private sector/NGOs. Support staff must not have additional responsibilities in departments. Recognizing the role of Biotechnology, efforts of ICAR should be supplemented with those from other science departments like Department of Biotechnology and CSIR. Research should bear the cost return factor in mind in order to encourage easy adoption with minimal extension efforts and enhance the incomes of resource poor farmers. Research should also be gender sensitive and promote reduction of drudgery for women in Agriculture. Trade policies should not work at cross-purpose with Mission objectives, even though international trade environment and requirements of foreign policies may become pressing in the contemporary context. A Mini Mission on Trade Strategy should be added to every Technology Mission in view of its importance for incomes of farmers. There should be greater focus on marketing efficiency and price signals in attention to infusion of technologies. Excessive reporting should be avoided. Frequent inspection by small multi-disciplinary team of retired officials, scientists, NGOs, farmers etc should be encouraged. Concurrent evaluation for mid course correction would be critical and the agencies should be more broad based and independent. Specialized financial release procedure should be revised to ensure timely release of funds to States and above all release to field agencies. Farmers should be associated with all levels at decision making and monitoring. Watershed or irrigation
command area should be the point of convergence and integration of all relevant Technology Missions. All Missions should be integrated under an umbrella to be called **National Federation of Farm Technology Missions** to be chaired by a practicing farmer. Focus of the Technology Missions should not only be an enhancement in productivity but an increase in income levels of farmers. Village Knowledge Centres should work as front line delivery system for speedier and cost effective dissemination of technology. Centrality of Panchayati Raj Institutions must be built in while formulating the Technology Missions.

21. To sum up, the Technology Mission is an efficient tool for programme design and implementation for achieving well defined production goals on a time bound and cost effective basis. For its success, the following important ingredient identified by late Shri Rajiv Gandhi is fundamental – “We would like to put one person in charge of such a Mission with full funding and with no restriction on him whether bureaucratic or otherwise. The only limits will be certain achievements, which must come within a certain timeframe”. NCF recommends that the existing organizational and managerial structures, in the case of the Technology Missions in Cotton and Horticulture be reviewed in the above context. **Authority, Accountability, and Achievement**, should be the basic management principles underpinning Technology Missions.
Annexure - 1

Field visit of the team of NCF under Prof. M.S. Swaminathan, to Patiala, Sangrur, Mansa and Bhatinda Districts in Punjab during 16-18 October 2005.

A brief summary of observations and suggestions is as under:

1. Professor M S Swaminathan (Chairman), Shri Y C Nanda (Member), Shri Atul Sinha (Member Secretary) and Ms. R V Bhavani (Officer on Special Duty) visited a number of farmers’ fields in cotton, rice and other crops in several districts of the Punjab and held discussions with farmers. We also visited the Sunam Grain Market and the Cotton Mandi at Mansa. In addition, visits were made to seed production plots, fish ponds, a soybean processing plant, Young Farmers’ Association, crop diversification fields (tomato, capsicum, Jatropha etc.), breeding plots of Kohinoor Seed Fields India Pvt Ltd., and Preet Agro-industries Pvt Ltd at Nabha and saw some new agricultural implements. In addition to discussion with farmers and officials at every place, discussions were held with District Commissioners at Bathinda and Sangrur.

2. We had the privilege of being accompanied throughout by Dr. G S Kalkat, Chairman, Punjab State Farmers’ Commission, Er. B S Sidhu, Director of Agriculture, Mr. S S Randhawa, General Manager, Punjab Mandi Board, Dr. Dhawan of PAU, several senior officers of the Government connected with marketing and input supply and scientists of the Punjab Agricultural University. Based on a wide range of discussions held with the principal stakeholders, the following observations and suggestions are made for appropriate follow-up action by the Central and State Governments.

A. Technology

1. There is need for extensive trials by PAU of the best available hybrids of Bt cotton and rice. The most suitable hybrids together with appropriate agronomic practices will have to be recommended for each agro-ecological zone. Bt cotton
hybrids should be introduced alongwith an Integrated Pest Management (IPM) system, so that the resistance does not breakdown within a few years.

2. Cotton varieties with the Bt gene and *arboreum* hybrids need to be developed.

3. There should be research backup for the crop diversification programme. **Diversification will succeed only if there are backward linkages with research and forward linkages with market.** Also, since soybean cultivation is likely to expand, a soybean processing plant should be established.

4. Research on the breeding of potato varieties with red skin for export and trials with pigeon pea (*arhar*) hybrids need to be taken up.

5. In order to take advantage of the potential for fish production, including fresh and brackish water prawns, there is need for research on fish seed and feed production. There is scope for introducing the culture and marketing of air-breathing and ornamental fishes. This will be particularly helpful to landless labour families.

6. In order to improve income and work security for farm families, farming systems research should be promoted (crop-livestock-fish-agro-forestry).

7. There is need for better quality control of seeds and pesticides. Credible certification procedures will have to be introduced.

B. **Conservation and enhancement of the ecological foundations essential for sustainable agriculture**

8. Farmers should be issued with **Soil Health Cards** containing information on the chemistry (macro and micro nutrients), physics and microbiology of the soil. Such Soil Health Cards should be updated annually.

9. Guidelines for the sustainable use of ground water should be developed on a priority basis. In several places, the static component of the aquifer is being exploited. **Water harvesting and recharge of the aquifer should be made mandatory.** Farmers repeatedly emphasized the need for steps to recharge the aquifer. Water quality should also be monitored, particularly for pesticide residues.
10. **The State Land Use Board** should be revitalized and restructured. It should be managed professionally and should have the technical capacity to extend **proactive advice** to farmers based on meteorological and marketing factors. Matching cropping pattern with irrigation water requirements will have to be done by the Land Use Board. **This is an area where collaboration with the US under the Prime Minister’s Indo-US agricultural science collaboration programme will be very useful.** Our farmers urgently need advice on Land Use, based on considerations of both ecology and economics.

11. **Energy Security:** With the rising cost of diesel, farmers need electricity. They need **reliable electric power supply**, more than free power. The Bio-diesel programme involving *Jatropha* cultivation needs considerable scientific underpinning and good quality planting material.

C. **Economics**

12. The cost-risk—return structure of farming is becoming adverse to farmers. Farmers are getting increasingly indebted and frustrated. Under these conditions, the younger generation may not take to farming. Urgent steps are needed to convert despair into hope on the farm front.

13. Input prices are going up (particularly diesel prices), while output prices are not keeping up with the rise in cost of production. **The Minimum Support Price (MSP) should not only be continued, but should be linked with the Wholesale Price Index**, as is done in the case of the salaries and allowances of government employees.

14. Interest Rates for farm loans should be brought down to the level of consumables like automobiles. **In China, the interest rate for loans to farmers is zero.**

15. **A Centre-State Contributory Price Stabilizations Fund** should be established, to insulate farmers from a significant fall in prices, either due to domestic factors or due to global trade factors (WTO regulations)

16. The quantum of NABARD loans should have flexibility in relation to the technologies adopted, such as Bt cotton and hybrid rice. The Policy relating to a uniform scale of finance needs review.
17. A special awareness programme should be started to impart insurance literacy among farmers, with reference to available crop, animal, weather, health and other insurance programmes relevant to farm families.

18. A National Calamities Fund should be established to insulate farmers from severe losses due to natural calamities.

19. Agricultural progress should be measured by the annual rate of growth in farmers’ income, and not just by figures relating to production and productivity. For example, in China, the growth in the income of farmers during 2004-05 was 6%. In India, it will be on the whole negative, as indicated by the increasing debt burden faced by farm families.

D. Market Reform

20. The State has already amended the APMC Act, thereby facilitating the growth of pro-farmer markets. The transition from existing trade channels like Arthias should be brought about with care, so as to ensure that the new systems of farmers-purchaser linkages are both beneficial and sustainable. Opportunities for assured and remunerative marketing hold the key for Punjab’s agricultural future.

21. Development of state of the art market infrastructure should become a part of the Bharat Nirman programme. Since the well-being of over 60% of India’s population depends upon income security from farm enterprises (crop and animal husbandry, fisheries, forestry and agro-forestry and agro-processing)

22. Market modernization should include facilities for electronic weighing, grading and assessment of the quality parameters used for price fixation. Classification of cotton, rice, wheat and other crops for determining prices should be done on transparent and well-defined criteria, so that farmers do not get the feeling of discrimination in the market. Good facilities are now being developed under the Cotton Technology Mission Project. Similar facilities should be set up for fruits, vegetables and flowers under the National Horticulture Mission.

23. In the case of cotton, ICAR may be requested to set up a Regional Centre of the Cotton Technology Research Laboratory, Mumbai, to serve the needs of
Punjab, Haryana and the Ganganagar district of Rajasthan. The State Government may provide land and other facilities for the establishment of such a Centre at Bathinda – The Regional Cotton Technology Centre should have DNA finger printing facilities so that disputes relating to spurious Bt cottonseeds can be settled scientifically. At the moment, farmers have no way of knowing whether they are being cheated in relation to Bt seeds.

24. There is need for establishing a **Market Knowledge Centre**, at each of the major markets and mandis, with facilities for Internet connection and for operating a community radio station. This will help to spread market and trade literacy and also to link with Futures Markets. Such Centres can be established with support from NABARD under the RIDF (the Union Finance Minister has provided Rs.100 crores in the Union Budget for 2005-06 for establishing Village Knowledge Centres)

25. FCI should develop a system of traceability of the material sold, so that farmers are not cheated by the rice millers.

26. The infrastructure at Mandis and Markets should include facilities for farmers like canteen, drinking water, rest house etc.

27. To augment farmers’ income, there is need for multiple sources of income. Dairy and poultry farming can provide additional avenues of nutrition and income, particularly for women. There is need for greater R&D efforts in the areas of green fodder and feed production. Fodder and Feed Banks can be established to assist landless labour families, a large proportion of whom are Dalits, to take to stall-fed animal husbandry and backyard poultry farming. Market tie-up will be essential to ensure fair return and avoid risks. Micro-finance should be supported with appropriate backup services, so that it becomes **Livelihood Finance**.

28. There is need for a **well-defined Code of Conduct for Contract Farming**, so that producers and purchasers experience a win-win situation.

29. **Farmer to Farmer Learning** – NCF has recommended the establishment of **Farm Schools** in the fields of farmer-achievers. This will be appropriate particularly in the areas of horticulture and new technologies like Biotechnology.
and Information Technology. The State Farmers’ Commission can identify the fields of farmers where Farm Schools can be located.

30. Punjab agriculture is at the crossroads – economically and ecologically. There is need for once again introducing a symphony approach involving mutually reinforcing package of technology services and public policies in input and output pricing and investment in infrastructure. Punjab was the leader in the Green Revolution achievement. **It should now become the flagship of the Evergreen Revolution movement.**
Annexure - 2

Field visit of the team of NCF under Prof. M.S. Swaminathan to the Vidarbha Region of Maharashtra during 19-21 October 2005.

A brief summary of Observations and suggestions is as under:

1. Prof. M S Swaminathan, Chairman, NCF, Shri. Y C Nanda, Member, Shri. Atul Sinha, Member-Secretary and Ms. R V Bhavani, (OSD), visited farmers’ fields as well as the homes of four farmers who had committed suicide, on 19th – 20th October and held discussions with farmers, officials, entrepreneurs, scientists and media personnel. We also visited two APMCs and discussed marketing problems in cotton and soybean. We had the benefit of listening to the widows and children of farmers who took the extreme step of taking their lives.

2. We were accompanied throughout by Hon. Rana Jagjit Singh Padam Sinh Patil, Minister of State for Agriculture and Employment, Dr. S K Goel, Commissioner (Agriculture), Shri. Vijay Jawandhiya, Farm Leader and Shri. P Sainath, a leading media analyst of farmers’ distress.

3. We had the great privilege of visiting the Maharogi Sewa Samiti, Anandwan, Warora, and calling on Pujya Baba Amte. We were shown the remarkable transformation which has taken place in the lives of leprosy victims. The message of hope represented by Anandwan is the need of the hour. Dr. Vikas Amte showed us around Anandwan, where the concept “wealth from waste” has become a reality.

4. We are deeply indebted to the Hon. Chief Minister of Mahashtra Shri Vilasrao Deshmukh, Hon. Rana Jagjit Singh Padam Sinh Patil, Minister of State for Agriculture and Employment, Dr. S K Goel and the many government officers, and farm families of Vidarbha, for their extraordinary kindness and efforts to make every minute of our visit an educational experience of immense value to our work.

5. We were deeply moved by the courage shown by the widows and children of the following four families we were privileged to visit, to express our condolence and solidarity with them in their hour of sorrow.

- Late Shri. Prabhakar Shamrao Khatale, Asthi Village, Wardha District
Late Shri. Ratilal Bapurao Rathod, Bandar Village, Yavatmal District
Late Shri Maruti Mahadev Rasse, Pisgaon Village, Yavatmal District
Late Shri Vilas Ramlu Ranganeniwar, Chalbardi Village, Wardha District

5.1 It was clear from these visits that there is an urgent need for action on both eliminating the circumstances under which farmers are forced to take such an extreme step of ending their lives, and initiating steps to provide livelihood security to the widows and educational opportunities for the young children.

5.2 Based on our visits and discussions, we would like to offer a few suggestions, for the consideration of the State and Central Governments. It will be an understatement if we say that there is a serious crisis developing in the health of our agriculture, which is the backbone of our food, livelihood and environmental security systems. For every problem, there is also an affordable and implementable solution. We should identify both short-term and long-term remedies both in public policy and technology development and dissemination. Water, credit, farmer-friendly services and technologies, and opportunities for assured and remunerative marketing are the basic needs of farm families.

6. **Agrarian Crisis – Maladies and Remedies**

6.1 The maladies affecting the farmers of Vidarbha and the potential remedies have been articulated clearly by both the State Government and the media. Print and electronic media have played a particularly valuable role in highlighting the quantitative and qualitative dimensions of the agrarian crisis. The most important among them relate to meteorological and marketing factors and the private and public credit and input supply systems. Some of these are following:

- Damage caused by unseasonal rain, to soybean, cotton and Jowar.
- High cost of inputs and unremunerative output prices; diesel and transport costs are rising continuously. The economics of farming as measured by its cost-risk-return structure is adverse to farmers.
- Farmers are facing high income insecurity. MSP for cotton is low and the payment is in installments and also highly irregular.
- Irrigation facilities are very limited. Water table is going down due to the unsustainable exploitation of the aquifer.
• Spurious inputs including seeds of Bt cotton are adding to the distress of farmers. There is no proper certification agency and often moneylenders are also merchants both for the sale of inputs and the purchase of the output. There is exploitation at every step in the Cultivation-Commerce chain.

• The famous Nagpur oranges are affected by Phytophthora and other diseases. There is no effective extension advice.

• Credit is the major problem. Interest rates are high. Those who are unable to repay loans to commercial banks due to crop failure are left with no option except to go to money lenders, who may charge 120% interest.

• There is no farmer-friendly insurance scheme. The insurance premium for agriculture is 16%, while it is 1% for non-agricultural enterprises.

• Wild animals are causing much damage in some areas.

• The economics of Bt cotton is adverse. Aphids, jassids and sucking insects cause much harm to the Bt cotton crop. Bt cotton cultivation can be taken up mainly by well to do farmers with irrigation facilities. Also several companies are selling Bt seeds and there is no clear advice to farmers on what to grow.

• Prompt payment in markets is rare. Payment in installments forces farmers to go to moneylenders for their immediate financial needs.

• Factor productivity is going down, since soil health maintenance is poor, particularly with reference to micronutrients.

• Modernization of market yard with reliable facilities for electronic weighing, grading, pricing etc. is an urgent need. Also, such market yards should provide facilities to farmers for lodging and boarding, since they come from long distances and generally have to stay for a couple of days.

• Availability of electricity is erratic. Diesel prices are constantly going up.

• Yield has gone up but income has come down due to adverse input-output price ratio.

• Animal husbandry is expensive due to high cost of fodder and feed. Fodder and Feed Banks have not been set up.

• Organic agriculture is spreading particularly among cotton farmers. Research support in the areas of soil health enhancement and plant protection is weak.
Also, there is no proper National Certification Agency and arrangements for getting premium prices in the home market.

- Cotton Corporation of India emulates the examples of traders, rather than serving as a friend of farmers. It needs to be made a farmer-centric organization.
- Farmers are not organized. Hence, they lack a collective voice in the shaping of Government policies in areas like pricing and marketing.
- The present crisis should serve as a walk-up-call. Delay in helping farm families to achieve income and work security will spell disaster to peace and national well being.
- Farmers need urgent help for saving them from usurious credit and unfair trade. The trading and Diwali seasons are around the corner. There is no time to relax on the action front.

7. Remedies

The following measures are urgently needed:

- Set up a Center-State Contributory Price Stabilization Fund.
- The Minimum Support Price (MSP) should not only be continued, but should be linked with the Wholesale Price Index, as is done in the case of salaries and allowances of government employees.
- Restructure and retool and State Land Use Board for giving proactive advice to farmers on land and water planning based on meteorological and marketing forecasts.
- Develop and introduce a farmer-friendly Insurance Policy, taking into consideration the suggestions of the Maharashtra Government.
- Introduce a pro-farmer Code of Conduct for Contract Farming.
- Without a huge infusion of credit, there is no hope. It should be remembered that much of what is called an increase in credit doesn’t even restore it to status quo ante, i.e. to what it was before the crisis began. Interest rates for farm loans should be brought down to the level of consumables like automobiles. In China, the interest rate for loans to farmers is zero.
• The number of rural branches of banks has declined in both absolute numbers and percentage terms since 1991. Rural credit has to be the top priority along with renewed and increased investment in agriculture.

• The Cotton Federation should revert to paying cash and should pay the amount, at one time not in installments. It should leave the issue of the bank dues to the banks and pay the advance bonus in this crisis year. Farmers must have the assurance that the Federation will buy their output at a fair and decent price.

• The Government needs to – (i) revise the import duty on cotton upwards, and (ii) check the dumping, so as to prevent distress sales.

• The Government is taking up the issue of price distorting subsidies by nations like the USA and EU that are harmful to Indian cotton. The MSP should thus reflect what the international price would be if these price-distorting subsidies were not there, like what is done in the case of sugar.

• A far better monitoring mechanism for Bt cotton needs to be set up than that which presently exists, using the technologies developed at CICR. A proper regulatory framework is a must to ensure that farmers do not suffer on this count. The legal framework has to be developed that makes quality control more rigorous.

• Vidarbha needs a huge investment and effort on the irrigation front. It is also important that the projects be of a manageable size and sustainable in nature. Water harvesting should be made mandatory.

• The State must articulate that it will never allow a system of water control that is harmful to farmers. A study needs to be made of the rainfall patterns to see if any long-term shifts are occurring. Since the headquarters of the Meteorology Department for the whole region is located in Nagpur, they could undertake this at once.

• Some control has to be exercised over racketeering and trading in distress. The Government must intervene far more strongly in this sector.

• Development of state of the art market infrastructure should become a part of the Bharat Nirman programme.

• The State has to help create a viable insurance programme for the farmers.
• Some ethical code is a must in the rendering of advice to farm communities. It also needs to be studied how existing technologies can be upgraded, apart from ensuring that new ones of an appropriate nature are introduced. No hybrid of a private company must be allowed in the market without a trial period of 3-5 years on the plots of Agricultural Universities. Only on strict verification of performance can these be allowed into the market.

8. **Immediate Action**

• Health indebtedness is increasing. The Government of India’s Rural Health Mission should operate immediately in the Farmers’ Suicide Hotspots.

• Agricultural progress should be measured by the rate of growth in farmers’ income.

• The Ministry of Agriculture, Government of India should be redesignated as **Ministry of Agriculture and Farmers’ Welfare**.

• An Employment/Livelihood Impact Analysis should be made with reference to both capital-intensive technologies and agriculture imports.

• The following livelihood security package should be introduced for the wives and children of farmers who have taken their lives:
  i) A source of steady income to widows, through viable on-farm / non-farm enterprises.
  ii) An education programme upto 12\textsuperscript{th} standard for young children, which covers expenses relating to clothing, nutrition and education.

• The **Every Village a Knowledge Centre Programme** should be introduced in distress hotspots.

• A study should be made on “**What can we learn from Anandwan?**” in terms of integrating humanism in the treatment of HIV/AIDS, Tuberculosis etc.

• The criteria now used for deterring eligibility for government support to the widows of farmers who have committed suicide are the following:
  a) Should have been a farmer
  b) Should have taken loan from a financial institution
  c) Received Notice of compulsory recovery
  d) Instance of Crop failure

269
8.1 This set of criteria need review, particularly from the point of view of the support being restricted to loans from financial institutions only. Non-institutional credit for moneylenders is the major problem and it will not be proper to ignore this reality.
Annexure - 3

Salient Points with Policy Implications Emerging from the Consultation with Farmers on Draft National Biotechnology Policy, organised by the National Commission on Farmers on 22.09.2005.

**Biotechnologies can offer new hope for increased productivity, sustainability and profitability, if the research priorities are right.** Tissue culture in banana and Bt cotton hybrid are the most widely adopted agricultural biotechnologies in India. Area under Bt cotton is expanding, having doubled from the last year acreage to over one million ha (under legally released Bt cotton hybrids) during 2005. Some participating farmers, cultivating Bt cotton for the last three years, reported additional net profit of at least about Rs.12,000 per ha, and about 40 to 50 per cent savings in the pesticide use and in the numbers of sprayings, while others reported failure due to drought and multiple pest epidemics. Moreover, the Bt hybrids were early maturing, thus enabling double cropping in otherwise single-cropped areas.

2. Awareness about biotechnology, especially transgenics/GMOs, varied from as low as 2% to as high as 80% in different cotton growing areas. However, genetic literacy was generally low as most of the Bt cotton farmers grew no **refugia** and did not provide recommended isolation distances needed for preventing cross-pollination between Bt and non-Bt strains so as to reduce the chances for the breakdown of resistance to bollworm in Bt cotton varieties. A general misgiving prevails, maybe partly due to aggressive advertisement by seed companies, that the Bt cottons need no pesticide application, forgetting that the Bt provides protection (often not 100 percent) only against bollworms. For controlling other pests, which at times assume serious proportions, such as aphids and white fly, pesticides will need to be applied as per recommendations. In fact, **IPM in Bt cotton fields is essential for durability of the resistance of the varieties.**

3. Although none of the Bt cotton farmers reported of any health, food or environmentally negative effects associated with Bt cotton, some of the farmers’ leaders questioned the efficacy of Bt technology and expressed deep concern about possible risks, whereas several of them emphasised the need a cautious approach while exploiting...
the technology and asked for a science-based pre- and post-release testing and monitoring system. Given the biodiversity richness of the country, the Consultation particularly emphasised that biotechnology should in no case be allowed to reduce naturally occurring biodiversity, instead it should be used to enrich and conserve indigenous biodiversity.

4. Inadequate testing under the major cotton growing agro-climatic conditions is a serious problem. Atleast three years testing should be done by ICAR to gather information on genotype x environment interaction as well as on isolation distances under a special All India Coordinated GM Crop Testing Project as recommended by the Swaminathan Committee. Special National Demonstrations and Lab-to-Land programme should be organised for such varieties.

5. Awareness on biotechnology and genetic literacy should be enhanced. While the private sector is active in popularising its products, the public sector is not doing enough to disseminate integrated information on various aspects of biotechnology. This gap should be bridged and the public sector should give high priority to increase the awareness of all stakeholders - farmers, private sector, extension agents, consumers, civil society and NGOs so that only science-based true information reaches all concerned, confusions are avoided and informed and well-considered decisions are taken at various levels. All biotech products, especially those derived from GMOs, should be labelled. The precautionary principle should guide our policy. Village Knowledge Centres, along with other information and communication channels, can play an important role in this regard.

6. “Illegal” Bt cotton is occupying almost as much area as occupied by “legal” Bt cotton varieties. With no quality assurance, no after-sale support and no answerability, this malady is bound to hurt all parties. Farmers must be educated of the consequences and must shun the temptation of quick profit and should buy only certified seed. Clear guidelines for risk assessment and transparent and unbiased testing procedures and approval of GMOs are sine qua non for rational development and utilization of the technology. Unofficial release of transgenics must be prevented.
7. The public sector, especially the ICAR and SAUs, have so far not been able to give any hardcore (based on r-DNA) crop biotech product in the hands of farmers. The system should respond to this serious gap and streamline and prioritise its biotechnology research and product development to serve the farmers as well as consumers. Due to a sort of monopoly, the hybrid Bt cotton varieties seed are priced highly, and are generally economically out of reach of resource poor farmers. **The public sector must come up with competitive Bt cotton hybrids so as to lower the seed cost and benefit resource poor farmers.** Further, **non-hybrid Bt cotton varieties should be developed** not only to further reduce seed prices, but also to enable the farmer to retain his own seed and to share it with other farmers. The Farmers’ Rights provisions of the Protection of Plant Varieties and Farmers’ Rights Act (2001) should be enforced without further delay.

8. The farmers identified the following areas for priority application of biotechnology: (i) tolerance to drought and other abiotic stresses, (ii) tolerance to saline conditions, (iii) nutritional enrichment, (iv) diagnostic kits, (v) resistance to diseases and pests, (vi) development of efficient bioagents - biofertilizers and biopesticides, (vii) in vitro culture for micropropogation and (viii) germplasm conservation and enhancement.

9. The extension system and Central-State linkages have generally been indifferent to biotechnology-led agricultural development. Extension personnel, particularly in those areas where commercialisation of biotech products, especially transgenics, is being promoted, should be adequately trained. **In Krishi Vigyan Kendras, a section on training in biotechnology should be introduced** to ensure safe and effective transfer of the technologies/products.

10. In congruence with CBD, Gene Treaty, National Plant Variety Act, Farmers’ Rights, the proposed Seed Bill and the Food Safety Bill, the Biotechnology Policy must seek harmonization of the concerned standards and guidelines, especially of sanitary and phytosanitary measures and codex alimentarius provisions. **Farmer friendly IPR provisions and trade and legal literacy should be promoted.** Syngenta’s efforts to patent the rice genome and other such moves should be resisted.

11. Since GM seeds are costly and the risk taking capacity of the majority small farmers is low, **insurance should be introduced alongwith GM seed sale, as recommended by the Swaminathan Committee.** Further, in order to curb production
and distribution of spurious seed, if the crop fails due to poor quality and genetic infidelity of the seed, the company must compensate the losses incurred by the farmer.

12. The Consultation strongly endorsed the establishment of an autonomous National Biotechnology Regulatory Authority as recommended by the M.S. Swaminathan Committee on Agricultural Biotechnology. The Authority, steered by an Advisory Committee comprising scientists, representatives of public and private sectors, industry, CSOs, NGOs and farmers, should combine both advisory and regulatory responsibilities and coordinate and harmonise the various development aspects, including IPR, SPS and bioethical and biosafety norms.

13. Farmers in industrialized countries are supported by capital, technology and subsidy. In contrast, Indian farmers, a majority of whom cultivate 1 or 2 hectares or less are handicapped by a very unfavourable cost-risk-return structure in farming. Interest rates are high, drought is frequent and markets are not pro-small farmers. Hence, farmers can take to new technologies like biotechnology only if they are supported by appropriate packages of services and public policies. In a globalised world, we have to enhance our agricultural competitiveness through productivity and quality revolutions. Biotechnology can help, but only if it is pro-poor, pro-women and pro-environment.
Annexure- 4

November 25, 2005

Dear,

Sub: Mission 2007 : Every Village a Knowledge Centre

You are aware that in his budget speech delivered on 28th February, 2005 the Finance Minister announced the decision of the Government of India to accept a recommendation made by the National Commission on Farmers last year that we should achieve knowledge connectivity throughout rural India by August 15, 2007, which marks the 60th anniversary of India’s ‘tryst with destiny’. During this year, several important steps have been taken to take the benefits of the Information and Knowledge age to rural families. Some of these are:

- Establishment of 100,000 ICT based Community Service Centres (CSC) by August 15, 2007, by the Department of Information Technology, Government of India. Leveraging SWAN (State Wide Area Network) infrastructure, CSCs will provide reliable broadband connectivity to remote villages.

- Decision of the Ministry of Panchayati Raj to establish internet connected ICT centres in all the 240,000 Panchayats/local bodies in the country by 15th August 2007. This will help to provide a public space for VKCs, characterized by access to all sections of the rural society.

- The Rural Information Society Initiative (RISI) of Bharat Sanchar Nigam Ltd (BSNL) which will aim to set up 100,000 VKCs each covering a population of 2000 or more.

- Support by NABARD through the Rural Infrastructure Development Fund to State Governments to organize ICT – Self Help Groups to establish and manage VKCs

- Promotion of e-governance as a key component of the National Common Minimum Programme and the proposal to include Knowledge Connectivity as an essential component of the Bharat Nirman Programme.

- Setting up of Public Tele Information Centres (PTICs) through the Universal Service Obligation Fund.
• Setting up Village Resource Centres (VRCs) at the Block level by the Indian Space Research Organisation (ISRO) in collaboration with appropriate public and civil society institutions to provide a wide range of services including teleconferencing facilities.

• Inclusion of e-health facilities under the National Rural Health Mission by the Ministry of Health and Family Welfare.

2. There are many other initiatives by both Central (eg. DST, CAPART, etc.) and State Governments. In addition both private industry and academic and civil society organizations are actively involved in bridging the urban-rural digital divide and in assisting rural families to have access to the information they need in relation to health, livelihood, food, water and income security. An International Support Group has also been formed to harness global support for Mission 2007.

3. I enclose two publications which will provide an idea of the current status of Mission 2007; Every Village a Knowledge Centre. It is obvious that if we can achieve convergence and synergy among the numerous on-going as well as emerging programmes, the goal of achieving a Rural Knowledge Revolution by 15th August 2007, can become a reality. While the green revolution helped us to improve the productivity and production of rice, wheat and other crops, the knowledge revolution will help to enhance human productivity and entrepreneurship in every sphere of human activity.

4. An urgent need is training and capacity building in ICT. The Jamsetji Tata National Virtual Academy for Rural Prosperity will be happy to assist in the area of capacity building. The training has to be in the local language. To promote the spread of local language computing in the country, software tools were recently released in Tamil and Hindi in Chennai and Delhi.

5. I am glad to inform you that at the World Summit on Information Society (WSIS) held at Tunis recently, Mission 2007 was highlighted as an outstanding example of the power of partnership in achieving the goal of “Connect the World by 2015”. The whole world is looking up to us in spreading the digital revolution on the principles of social inclusion, gender equity, reaching the unreached and voicing the voiceless. The provisions of the Right to Information Act (2005) can be implemented effectively if the ‘Every Village a Knowledge Centre’ movement gains momentum.
6. The Tunis World Summit on Information Society demonstrated the enormous progress made in technology development since the WSIS held at Geneva in 2003. The world is thus witnessing two opposite trends. The explosive progress in science and technology is providing uncommon opportunities for health, food, water, work, energy and literacy for all. On the other hand, a considerable proportion of humankind living under conditions of poverty, hunger and deprivation feels a sense of social exclusion and injustice. Consequently, there is a growing violence in the human heart. While WSIS was in progress in the midst of a feeling of a brave new world of technological breakthroughs, the main news in the media every day was the loss of innocent lives caused by bomb explosions in different parts of the world. The extensive co-existence of unsustainable life styles and unacceptable poverty is not conducive to either harmony with nature or with each other. This is why the success of “Mission 2007: Every Village a Knowledge Centre” is so important for human security and well-being in our country. We should ensure that Government initiatives like CSCs of DIT, RISI of BSNL, etc. are pro-poor, pro-women and pro-livelihood in both their design and implementation.

7. I shall be grateful if you would kindly set up a small group of concerned Ministers and officials under your Chairmanship to monitor progress in achieving the goal of taking the benefits of the digital revolution to every village in your State by 15th August, 2007.

With warm regards,

Yours sincerely,

-Sd-

(M.S. Swaminathan)

Addressed to All Chief Ministers
29th October, 2005

The Eighteenth Meeting of the National Advisory Council (NAC) was chaired by Smt. Sonia Gandhi in New Delhi today and was attended by ten Members of the Council.

2. The National Commission of Farmers made a Presentation on the First and Second Reports of the Commission, in the backdrop of the problems arising in the Farm Sector leading to sub-optimal growth rate in Agriculture and distress amongst farmers. The NAC expressed deep appreciation of the work done by the Commission to formulate a comprehensive blueprint for the development of Indian Agriculture. Amongst other subjects, the following were discussed:-

i) There needs to be a paradigm shift from micro finance to livelihood finance and technology empowerment as well as market reforms in order to promote the concept of livelihood security in areas characterized by farmers’ distress,

ii) An integrated “Parivar Bima Policy” may be introduced for the rural poor for providing hospitalization expenses, life cover for death/disability and cover for the dwelling units. This could be linked to Self-Help Groups (SHGs) and largely funded by Members’ contributions,

iii) A Gram Panchayat Mahila Fund could be set up with earmarked outlays for group activities and common amenities for women for on-farm and other gender specific needs. Legal land titles and allotment of surplus lands, including State Farm lands, to women SHGs should be ensured for the empowerment of farm women,

iv) Mission 2007 involving the establishment of Village knowledge Centres may be considered for early implementation to promote Knowledge Empowerment and Capacity Building in the areas of agriculture and animal husbandry, fisheries, forestry, agro-processing, marketing and genetic literacy. Steps may be initiated to establish cotton
estates, horticulture estates, organic agriculture estates and aquaculture estates for small holders,

v) The Essential Commodities Act and other legal instruments relating to marketing, storage and processing of agricultural produce need to be reviewed in order to meet the requirements of modern agriculture. The Land Use Boards at the Centre and in the States may be restructured and supported by Teams of Experts to reach pro-active advice to the farmers based on meteorological, marketing and managerial information and to help in providing early warning on possible surpluses (and shortages) on farm commodities,

vi) A Technology Mission on sugarcane may be organized jointly with the Sugarcane Growers’ Organizations, Cooperatives and the Sugar Factories with focus on research, technology transfer and optimization of productivity and quality of sugarcane,

vii) Institutional strengthening through the setting up of such bodies as a Livestock Feed Corporation and a National Fisheries Development Board may be expeditiously examined,

viii) Farm schools may be established to promote farmer-to-farmer learning and Farmers’ Markets revamped to meet the needs, particularly, of small producers.
Annexure – 6

Gist of the communication regarding Revitalization of Indian Agriculture sent by the National Advisory Council (NAC) to the Government.

Recently, the National Commission on Farmers (NCF) have made a Presentation on the comprehensive blueprint that they have drawn up to revitalize Indian Agriculture. The Government would agree that such a blueprint needs to be implemented on priority and with a great sense of purpose and determination. Four decades ago, the political, scientific and administrative leadership had combined and interacted in a remarkably effective manner to take the country forward towards self-reliance in foodgrains. It is that spirit which needs to be recaptured to provide a New Deal to our farmers and their families. This is, in fact, the cornerstone of the National Common Minimum Programme which, among other priorities, stresses vastly increased public investment in agriculture and vastly expanded supply of agricultural credit to small and marginal farmers.

2. NAC is aware that a separate Meeting of the Planning Commission has been held to review the policies and programmes in the agriculture sector. Reforms to strengthen credit cooperatives are also on the anvil and the budgetary allocations for the Indian Council of Agricultural Research (ICAR) have gone up substantially. At the same time, Bharat Nirman would impart new momentum to the expansion of Irrigation.

3. It is felt that the Government have now to give serious thought as to how best the various Recommendations of the NCF can be implemented and operationalized by the Central and State Governments. The NAC is of the view that while implementation would have to be the direct responsibility of the Government Agencies and other Institutions, there would still be need for an Independent Expert Body with credibility and expertise (like the NCF) to monitor and evaluate this process closely.

4. An Empowered Group of Ministers could, perhaps, be of help in reaching conclusions expeditiously. The real challenge is to launch the implementation phase in a coordinated and systematic manner and to underline high-level public visibility for and accountability of our agricultural revival programmes. It will be necessary to break away from the bureaucratic mould in order to achieve this vital objective.
Annexure-7

Subject: Constitution of the Agriculture Coordination Committee.

Government had earlier decided, vide O.M. of even number dated 19.10.2005, to constitute an Agriculture Coordination Committee. In partial modification of the O.M. under reference, it has been decided that the revised composition of the Agriculture Coordination Committee would be as follows:-

i) Prime Minister : Chairman

ii) Minister for Agriculture & Food &
Civil Supplies & Consumer Affairs

iii) Minister for Fertilizers & Chemicals

iv) Minister of Finance

v) Minister of Commerce & Industry

vi) Minister of Water Resources

vii) Minister of Rural Development

viii) Minister of Panchayati Raj

ix) Minister of State for Food Processing

x) Minister of State for Science & Technology

xi) Deputy Chairman, Planning Commission

xii) Chairman, Economic Advisory Council

xiii) Chairman, National Commission on Farmers

xiv) Member (Agriculture), Planning Commission

xv) Principal Secretary to PM : Convenor

2) Secretaries of the Ministries/Departments concerned would be permanent invitees.

3) The Chairman could invite any Minister/Officer depending upon the context.

4) The Committee may commission specialized studies depending upon the requirements, which arise from time to time and could engage in the following tasks:
a) Identify key areas that require fresh policy initiatives, particularly those of an inter-sectoral nature.
b) Outline the follow-up action that needs to be taken to implement identified policy initiatives.
c) Identify institutional mechanisms to implement policies and programmes
d) Monitor key policy initiatives
e) To oversee and coordinate the integrated implementation of those recommendations of the National Commission on Farmers that are accepted by the Government

Sd/-
(T.K.A. Nair)
Principal Secretary to PM
Annexure- 8(a)

Consultation on “Empowering male and female members of elected local bodies to discharge effectively their role in conserving and improving the ecological foundations for sustainable agriculture like land, water, agro-biodiversity and the atmosphere with priority attention to irrigation water”.

1. The terms of National Commission on Farmers inter-alia provide “Suggest methods of Empowering male and female members of elected local bodies to discharge effectively their role in conserving and empowering the ecological foundation for sustainable agriculture like land, water, agro-biodiversity and the atmosphere with priority attention to irrigation water”.

2. Section 243G of the Constitution 73rd Amendment Act, 1992 empowers state legislature to endow the panchayats with such powers and authority as may be necessary to enable them to function as institutions of self-government and such law may contain provisions for the devolution of powers and responsibilities upon Panchayats at the appropriate level, subject to such conditions as may be specified therein with respect to-
   (a) The preparation of plans for economic development and social justice.
   (b) The implementation of schemes for economic development and social justice as may be entrusted to them including those in relation to the matter listed in the Eleventh Schedule.

3. It is however; well known that in spite of efforts at various levels, Panchayati Raj has still not been achieved commensurate with the letter and spirit of the constitution 73rd Amendment Act, 1992. A task force on devolution of power and function upon Panchayati Raj Institutions was set up and its Report(2001) had made several Recommendations. A comparison of snapshot captured in 2001 and now shows that the situation does not appear to have substantially changed. The Consultation was convened to discuss the various issues related to the empowering of the elected Members of the Local Bodies. It was attended by renowned subject experts, civil servants, civil society representatives and NGOs.
4. Important issues expected to be covered in the Consultation included:-
   (a) Issues regarding devolution of exercisable powers along with administrative and financial support to the members of Panchayati Raj Institutions particularly its female members for the conservation and improvement of ecological and financial sustainable agriculture including priority attention to irrigation waters.
   (b) Adequate monitoring mechanism with “teeth” for the implementation of the 73rd Constitutional Amendment Act, 1992 and the recommendations of the Seven Round Tables of Ministers In-Charge Panchayati Raj between July-December, 2004.
   (c) Activity mapping for these Recommendations.
   (d) Equipping the Members of elected local bodies through training and re-training to discharge their responsibilities. This is particularly important in view of the reservation available for women in the Panchayati Raj system. The specific solutions to the problems of training of elected women members may be discussed.
   (e) Considering the ground realities of politics in the rural areas and the trend towards populism at the cost of ecological well being, the reconciliation of democracy with sustainable development may also be discussed.
   (f) Lessons learnt from Success stories including those in the Ministry’s website at www.panchayati.nic.in as well as the large areas of darkness, even throwing up the informal institution of “Sarpanch Pati”.
   (g) Roadmap for further work of NCF on the subject mentioned in its terms of reference.

Observations & Suggestions

5. The salient observations and recommendations that emerged on diverse issues related to empowering male and female members of elected local bodies are summarized below:
   (i) Meeting should be convened with the state ministers to address the issue of devolution of exercisable powers. Most of the states do not have a separate ministry of Panchayati Raj. It is generally MoRD, which also handles Panchayati Raj. At present the principal sources of Panchayat funds are from GOI. Under the 12th Finance
Commission, Rs.20, 000/- crores will be made available to Panchayats through the state consolidated fund. States have to release this fund within 15 days of sanction; otherwise they will have to pay interest on it. For efficient functioning disbursed amount to the States will be displayed on the website on the Ministry of Panchayati Raj.

(ii) Holding of elections is mandatory for the transfer of the funds to Panchayats. Panchayats will also monitor the transfer and proper utilization of the disbursed fund. Although a Panchayat empowerment incentivisation fund is being framed, to get things done, persuasion is more important than financial incentives.

(iii) Functioning of parallel agencies must be stopped and there must be one central agency to look after all the schemes run by these parallel agencies in order to check duplication of schemes and wastage of resources. The various schemes should be routed through a single agency and decision makers should be Panchayats.

(iv) There is also a need to check the bypassing of the Panchayats in flow of funds. A case in point is recent success the MoPR had in bringing about changes in Secton 13, 15, and 16 of the recently passed NREG Act, 2005. Under Section 13, the principle implementation agency will now be the Panchayat, at the district, intermediate and village level. Under Section 15, in every Panchayat there will be a programme Officer of the rank of BDO to assist the Panchayat. Under Section 16, the Programme Officer will allocate at least 50% of the work to the Gram Panchayat.

(v) The weakest link at present is the Gram Sabha. The Gram Sabha has to formulate and approve the Panchayat plan. The MoPR is now insisting that every Gram Sabha have a Mahila Sabha which must also meet regularly and contribute to discussion. The Gram Sabha should develop as an instrument for social audit.

(vi) Official reluctance to work with the Panchayat leaders is undesirable. The Panchayat system needs to be protected from the corruption especially from the lower level.

(vii) The Committee headed by Mr. P. Ramachandran had recommended that in the 11th FYP, there should be state plan, district plan and panchayat plan. District Plan Committees (DPCs) are crucial for the success of Panchayati Raj. And at least 4/5 of the members of the District Planning Committee should be Panchayat members. At present DPCs exist only in a few states.
(viii) Panchayats must be answerable and accountable for activity mapping. Ideally, consolidated plan must be prepared at the level of Gram Panchayat and fed into the district plan.

(ix) There is a need to develop a village level database as the data below the district is not available in almost all the states. The Village Knowledge Centre (VKC) could be the focal point for maintaining this database. GIS maps are needed for micro level planning.

(x) There is a need to develop the plans based on the local problems by the Panchayats themselves rather than DPC. The plan made by Panchayat should be approved by the Gram Sabha.

(xi) There is a need to develop micro plan for preserving ecology, biodiversity and sustainability of agriculture. Micro plan development by the Gram Sabha can bring to the forefront the link between democracy and development.

(xii) For every plan there should be a link with technological backup and we can have services of retired persons as well as scientists of the SAUs/ICAR to assist in making a complete action plan for the villages to address their problems keeping in mind the available resources.

(xiii) Awareness, training and capacity building are crucial for the successful Panchayati Raj. There is a need to systemize training and capacity building of Panchayat members and awareness of rights and duties of members of Gram Sabha should go together.

(xiv) Access to information is also very important. Village Knowledge Centers (VKCs) can become an important link in the training and capacity building exercise. Every Panchayats should have a VKC. Access to information and awareness should be linked with mission 2007 “Every Village a Knowledge Center”.

(xv) There is a need to adopt of flexible technology for training of women by SIRD & NIRD. The modules should be gender sensitive which help to women open up. A gender sensitization module has been developed by MSSRF but the same has not been adapted by Agricultural Universities.

(xvi) Advisory research in training and research for training will be helpful for preparation of modules on gender specific issues. There is a need to intensify the efforts
for the states like UP, Bihar, Rajasthan and Orissa where the solution of the problem of the training to women is crucial and there is a need to establish to and fro feedback to the arrangements on the training.

(xvii) Women need information on how to discharge their roles as most of the women are involved in multifarious activities.

(xviii) Training is important not only for the representatives of their panchayats but also for the govt. officials at the block and district level working with them. A change in mindset is needed among officials.

(xix) Leadership training is crucial. Experience has shown that good leaders can do a lot to bring about positive changes.

(xx) Training is not one time exercise, follow up is needed. The training module and format has to be suited to local needs. Training has to be at the Gram Sabha level.

(xxi) Institutions like ICRISAT should work at the grassroots level with KVKs which provide technical support under the programmes like the NREG. Rs. 100 cr should be recommended for KVKs to play proactive role in capacity building and training.

(xxii) There is a need to discuss developmental issues rather than just political issues on the public platform. There is a need to pass orders that no body can supercede the elected male and female members of the local. Self-Help Groups (SHGs) becoming parallel structures was discussed and it was felt that SHG promotion if felt necessary, may be through Panchayats.

(xxiii). There is a need to highlight the success stories and exchange information about them.
Consultation on “Hindu Succession (Amendment) Act, 2005 and its Impact on Rights to Land Ownership for Women in the Context of Increasing Feminization of Agriculture” held on 21st September, 2005

1. It is heartening to note that the Parliament has passed the Hindu Succession Amendment Bill, 2005 and the Act has come into effect from the 6th September 2005. This in turn is of great relevance in the context of NCF terms of reference which inter-alia cover “Recommendation to be made for the credit, knowledge, skill, technological and marketing empowerment of women, taking into consideration the increasing feminization of agriculture and the proposed conferment of right to land ownership”.

2. In the First Report accelerated programme activity were recommended to be taken up for (i) Existing policy pronouncements and directives of direct transfer of land to women (ii) Improving inheritance rights of women to land by bringing changes in laws and working towards better implementation (iii) Enabling women to buy land from the market. In the interest of social justice as well as well-being of the families, enhancement of women’s rights and entitlement to lands deserves to be the first priority on the agricultural agenda.

3. The Hindu Succession Amendment Bill, 2005 addresses access to private land through inheritance. One of the most significant Amendment in the 2005 Act is deleting the gender discriminatory section 4(2) of the Hindu Succession Act (HSA), 1956. Section 4(2) exempted from the purview of the HSA significant interests in agricultural land, the inheritance of which was subject to the devolution rules specified in state level tenurial laws. But in several states the tenurial laws specify inheritance rules that are highly gender unequal. The 2005 Act brings all agricultural land on par with other property and makes Hindu Women’s inheritance rights in land legally equal to men’s across states overriding in consistent state laws. Secondly it provides daughters including married daughters birth right in Joint family property. If implemented in letter and spirit the act will have widespread ramifications for women’s access to agricultural land.
4. The consultation was convened to discuss the implementation of the HSA amendment Act, 2005 in particular and women’s access to land in general. It was attended by renowned subject expert, civil servants, civil society representatives and NGOs. It was expected that the consultation would focus on:

a) The adequacy of the provision of the Hindu Succession (Amendment) Act, 2005 for land rights for women.

b) The steps required for effective implementation of the provision of the Act by the States.

c) Difficulties foreseen in the implementation of its provisions both in letter and spirit.

d) States requiring special attention.

e) Issues relating to supportive services like credit, technology, knowledge and skills for farm women.

f) Any other issue relevant for converting conferment of land rights into an effective tool for empowerment of women in agriculture in rural areas particularly for on-farm/ off-farm income generation.

Observations & Suggestions

5. The salient observations and recommendations that emerged on diverse issues related to women’s land rights issues are summarized below:

i) There cannot be a unique model for solution of the problems prevalent in different areas. Different models are needed for different areas.

ii) The voluntary transfer of land rights of women should be there. Often a woman wants to give land to her daughter, but she is restrained from doing so because of mafia/ criminal pressures who simply grab her land.

iii) In most villages women get married within 7-8 km distance and they can take care of the land of their parents. Institutional mechanism to implement the law bypassing the obstructions should be thought out. Without protective mechanisms, it will be difficult to implement the Act.
iv) It is essential that similar rights for cultivation be provided to married and unmarried women. Right to cultivation should be determined by being a resident of the village. If a married woman comes back for some reason she should get access to land.

v) The Hindu Succession Act should be renamed Indian Succession Act and be available to any citizen of India on demand. The option should be available to women from minority communities also to appeal under the act.

vi) Bureaucratic will is needed to address gender inequality. Creating a conducive environment to implement the act honestly is also necessary. The initiative of local officials in the implementation of the act should be publicized for greater adoption by others.

vii) MPs/MLAs should set an example by applying the act to themselves. It should be also a part of the service condition of IAS/Central Government employees, Panchayat members etc. Government should also provide incentives to local officers to proactively implement the act. This will promote acceptance by the citizen at large.

viii) With the Hindu Succession (Amendment) Act now in place, it is necessary that the government fixes a time frame for its implementation.

ix) A change in mind set is needed to address the issues facing women. There have been instances that the training has been provided to men folk to write their will so that no land is left intestate (without a valid written will), enabling women to demand their rights. Training for writing of will that benefit women folk should be provided.

x) Ceiling law and definition of the family must be made uniform across the country. The importance of the act when the male members of the family migrate was emphasized.

xi) In the case of surplus land transfers, steps should be taken to avoid poor women getting poor quality of land.

xii) The cost of land registration should be waived or reduced when the land is registered in the name of women or a group of women.
xiii) There should be a control on leasing out practice because if the land is leased out to women farmers or group farmers then they do hard work to develop the land and get better productivity out of it only to find the owners wanting to take back his land. The lease agreement should be such that it can be upheld in a court of law.

xiv) There is an order from the State Government that the wasteland should be distributed to women’s groups by the Panchayats but the order is not having the desired effect.

xv) There is a need to start registration for land with joint pattas and it will be good if men will go for registration. State Govt. should document the wasteland, which is distributed under joint pattas. A wide campaigning is needed to promote joint pattas.

xvi) The ceiling surplus land should be provided to women first, then in joint pattas and remaining land could go to men.

xvii) At present data on ceiling surplus land, land acquired by the govt. and land distributed buy the govt. land under litigation is available for ten states only. There are no records available on how much land is registered in the name of men and women in agriculture. There is need to collect and computerize the data regarding this aspect and without any bias. There is need to continue consultation with state governments and try to get data in women farmers at Tehsil levels. Data should be gathered to capture the fragmentation of land holdings.

xviii) There is a need to go for Cadastral survey in the North East especially Meghalaya.

xix) There is a need to operationalise the law with greater awareness and opportunities to take maximum benefit of it.

xx) There is an urgent need for legal literacy to women in particular and farmers in general about the act. There is a strong need to strategies how this can be done and start legal literacy from school level. Legal aid should be available to the women. Small NGO group exist that are working in this area. Farmer’s organizations, bankers and panchayats should play a proactive role
in the awareness and implementation of the Act. VKCs can also play an important role in this.

xxi) Groups of women should be formed to access land accompanied by support services to improve the economies of scale because it is difficult to manage the land by individual women as she cannot access the services therefore, often sells the land. There is a need to develop village fund for women’s groups to purchase land for agriculture and other developmental activities.

xxii) 80% of the SHGs are women SHGs but virtually none of them are land based. Necessary action should be taken to promote land based women SHGs.

xxiii) There is a need for crop diversification and a consolidated approach for off-farm and on-farm activity to enhance the income and productivity of the farm as well as assurance of livelihood and nutrition security at household level.

xxiv) Lack of access to finance is a major issue in rural areas. Inability of land banks to provide credit in spite of legislation to the effect in place should be addressed. Loans should be provided at concessional rates where land is in the name of women. Need for changes in collateral system of banking have also to be examined.

xxv) A holistic approach towards allotment of land to women should be adopted. The govt. should also help in developing the land, other basic facilities and soft loans (e.g. Malaysia).

xxvi) There is a need for strengthening training for farm women and engendering of training institutions. Training on entrepreneurship development should be made a part of the Agricultural University curriculum.

6. Some other Suggestion in this regard would be:

(i) Ensure the recording of women’s inheritance shares by the patwaries, in all land records and in cases where women own land (via any means), ensure that their names are entered in the corresponding land record.
(ii) Promote schemes which fostered women owned group assets, including but not restricted to, village commons lands and village forests.

(iii) Provide insurance coverage to farmers for crop failure caused by lack of rain, drought, and damage by wild life and land slides.

(iv) Through media raise awareness of relevant legislation on women’s right to land and resources.

(v) To ensure the institutionalization and codification of inheritance laws for tribal communities.
Women in Agriculture – What next?

1. A two-day workshop was organized by the M S Swaminathan Research Foundation (MSSRF), Chennai, on November 11 and 12, 2005, on the theme: Women in Agriculture in India: What Next? The aim of the workshop was to discuss the status and problems of women in agriculture in India ten years after the Fourth World Women’s Conference held in Beijing in 1995, in the light of the commitments made by the Government of India at the Beijing conference and later in the Common Minimum Programme of the UPA Government. About 25 participants drawn from government, academia and civil society, including Chairman, NCF and Member Secretary, NCF participated.

2. The workshop benefited greatly from a review paper presented by Ms. C.P. Sujaya, IAS (Retd.) and Visiting Fellow in Gender and Development for 2005 at the MSSRF, who had earlier been commissioned to undertake such a review. In her paper entitled Beijing + 10: Women in Agriculture in India, Ms. Sujaya dwelt on the three major themes of growing feminisation of work, of agriculture and of poverty in the last decade, the problems in women’s access to land and other assets, and the lacunae in policies and schemes, supported by data and case studies. She also summed up, in conclusion, the policy changes required to address these issues effectively. A succinct presentation by Prof. M.S. Swaminathan, Chairman, National Commission on Farmers and Chairman, MSSRF, provided guidance to the workshop participants on areas where concrete recommendations could be made.

DISCUSSIONS

3. The consensus that emerged, noted that issues concerning Indian women ten years after the Beijing Conference of 1995 must be seen in the background of the consequences of the implementation of neoliberal macroeconomic policies since 1991, as well as the overall path of economic development since Independence. The structure of the economy inherited at the time of Independence and the nature of policies followed since then by successive governments at the Centre and in most States had, by and large, failed to address adequately the deeply entrenched inequalities of class, caste and gender. Often,
they had contributed to the widening of inequalities. The status of women in India even before the neoliberal reforms began therefore left a lot to be desired.

4. The reforms, which consisted, in the main, of policies of liberalization, privatization and globalization (LPG for short), were highly deflationary, and especially disastrous for agriculture and the rural economy, as also for key social sector areas such as health and education. Rural women, engaged mostly in agriculture, primarily as labourers and to a lesser extent as cultivators, were especially badly hit. While the reforms have been lauded by some as having ushered in an era of 6% annual growth rate of GDP, these figures provided poor consolation to rural workers, as the rate of employment fell sharply between 1993-94 and 1999-2000 as compared to the period 1987-88 to 1993-94. Agriculture and the rural economy bore the brunt of neoliberal policies of removal of all quantitative restrictions on imports, steep lowering of import duties on agricultural produce, slashing of input subsidies, collapse of institutional credit, near-absence of public investment, reduction in rural development expenditures, weakening of the public distribution system and decline in allocations for agricultural research and extension. The rate of growth of agricultural output in the post-reform period stands at less than 2% per annum, while the rate of growth of foodgrains output has fallen below the rate of growth of population for the first time since Independence during this period. These trends have been well-documented elsewhere and taken note of in the earlier Reports of the National Commission on Farmers.

5. It is against this disastrous performance of agriculture and the rural economy that the problems facing women in agriculture have to be understood and discussed. Women have been negatively impacted upon by these policies which have added to the problems women already face in a deeply patriarchal social milieu with structured gender inequality along economic, social, political and cultural dimensions. The collapse of rural and agricultural employment under neoliberal policies has led to large-scale migration, often (though not always) sex-linked. The migration of male earners has led to a certain degree of feminization of agriculture, as well as to a significant proportion of female-headed households. This in turn has meant that a disproportionate share of the agricultural crisis is borne by women. In many States of India, property and inheritance laws have traditionally discriminated against women, and despite some steps taken in
recent years to redress the situation, women are still mostly to be found recorded as agricultural labourers rather than as cultivators. The traditional patterns of community land and forest management in many tribal areas (Schedule 5) and especially in the hill States of north-eastern India (Schedule 6 and other areas) have entirely different property and inheritance laws, and here too the brunt is borne by the women. This is of course partly also due to the non-recognition of the work women do on their family farms.

6. The decline of institutional credit for agriculture and the onerous terms on which farmers are having to borrow are major factors contributing to rural distress. At the same time, during the last decade, there has been a highly visible micro-credit initiative, directed mostly through SHGs of women. The growth and experience of SHGs across the country is highly variable and region specific. While in some parts of the country, there has been a phenomenal disbursement of funds to women in rural areas, and some capacity building, via the intermediation of NGOs State agencies, line departments etc., which has enabled them to meet some pressing consumption needs it is far less clear to what extent this has enabled access to improved technology, higher productivity and profitable enterprise. SHGs in themselves can and certainly do provide women a new and legitimate social space where they can come together and explore avenues of collective action, but such instances have been only part of the story.

7. On the one hand, there is evidence that already overburdened rural women have now to shoulder even more responsibility and work, while the withdrawal of the State in crucial areas of rural infrastructure and welfare is justified in the name of empowering women and reducing the dependency culture. On the other hand, in some places, where the agriculture sector has been depressed and offering limited opportunities for work, the SHG movement has provided some diversification, off-farm employment and greater awareness of technological inputs. The conclusion that emerged recognized the value of SHGs as a space for women’s agency, but also noted that a great deal of capacity building of women in SHGs was still required to enable them to truly empower themselves. It was also pointed out that the promotion of SHGs and the provision of micro credit can only be a supplement to direct measures which provide women land and other productive assets, individually or in groups, that can serve as collateral for larger-scale, productive loans.
8. The conditions of existence of women in rural areas have been further worsened by the withdrawal of the state from education and health. Women now have to manage even more stringent family budget constraints in the face of increasing costs of health care and education. Evidence of greater violence against women in various forms points to the impact of the rural economic crisis in a context of embedded patriarchy as well as the rampant consumerism promoted by the forces of globalization.

9. The emergence of an active land market, dominated by speculators, especially in rural areas adjoining urban centers has led to encroachment on, or outright destruction of, common property resources, where again poor and dalit rural women are among the worst sufferers. They are now not only having to trek longer distances to fetch water, fuel and fodder and to attend to their ablutions, but also find their productive activities adversely affected.

10. While neoliberal policies had caused great distress to the rural economy in general and rural women in particular, this period has had some positive developments as well. Important among these were the emergence of Panchyati Raj Institutions (PRIs) and peoples’ movements of various kinds, including the SHG movement and wider movements questioning the logic of LPG policies and seeking a more people-centred policy frame. The workshop participants felt that both PRIs and SHGs needed considerable resource support for capacity building and that the processes of capacity building should be strongly engendered to strengthen and empower rural women. A stronger and more effective interface is needed between PRIs at all levels, particularly their women members and the SHGs and their federations, wherever they exist.

11. The issues of land reforms and land rights for women were both important, and the State should play a crucial role in the gendered implementation of land reforms, wherever relevant, since in almost all of the north-east hill States it is not the State but the village communities that control land. Preventing the erosion of the few traditional systems wherever these continue to exist where authority and agricultural decision-making is shared by women and men, is also a goal to be kept in mind.

12. The question of land lease is tricky, but lease arrangements that empower poor rural women without allowing land grabbing by more powerful forces including corporates
should be the desirable approach. In this context, it is noteworthy that the Common
Minimum Programme (CMP) of the UPA Government provides:
i) “The UPA government should ensure that at least one-third of all funds flowing into
panchayats should be earmarked for programmes for the development of women and
children. Village women and their associations should be encouraged to assume
responsibility for all development schemes relating to drinking water, sanitation, primary
education, health and nutrition”.

ii) “Complete legal equality for women in all spheres should be made a practical reality,
especially by removing discriminatory legislation and by enacting new legislation that
gives women, for instance, equal rights of ownership of assets like houses and land”.

13. Apart from removing discriminatory legislation and new legislation, legal and civil
society supports are required to ensure that new rights are not inherently biased against
community group rights and against non-land holding individuals - women, dalits, and
the poor.

14. The recommendations that were made at the meeting are presented under the
following heads: Land and Productive Assets, Labour and Employment Generation,
Common Property Resources and NRM, Support Services, Self Help Groups, Data
Gathering, Women in Technology and Research

RECOMMENDATIONS

15. Land and other productive assets: Ideally, both men and women should be
recognized as heads of the household, and all property be jointly held, though provision
would have to be made for equal sharing of all property in the event of cessation of
marriage. While this may be a long-term goal, in the present context, it is necessary to
urgently take steps to reduce the burdens and disadvantages faced by women due to lack
of title to property, especially land, which excludes them from access to resources and
inputs, particularly land. This is particularly true with reference to the banking system
and its structural limitations, which require proof of title as collateral. Hence it is
recommended that:

i. From a gender perspective, because of women’s multiple productive roles, it
is necessary that agricultural policy and programmes adopt a farming
systems approach that integrates agriculture, livestock, fish, forestry and water resources, instead of treating these as separate sectors as at present.

ii. All NEW assets which have accrued to the household (before a specified cut-off date) by any means (purchase, transfer, grant etc) should be registered in the name of both husband and wife, applicable to all assets such as land, houses, trees, animals, equipment etc.

iii. The above should also apply to membership of groups/categories which are prerequisites for access to resources, e.g. water users’ associations.

iv. Banks should be asked to accept spousal ownership/membership as collateral for loans and extend Kisan Credit Card to women.

v. The distribution of land mandated by Government of India in the 1980s with regard to surplus land, wasteland, and ceiling surplus land should be monitored and recorded and up to date records prepared within a specified time limit

vi. Lands, particularly wastelands, vested with government should be transferred to women’s groups (including SHGs) for productive use and appropriate economic activity.

vii. The implementation of land reforms in a gender-sensitive framework should be closely monitored and up to date records prepared, keeping in mind recent legislation (Amendment to Hindu Succession Act 1956). The issue of community-held land has to be separately addressed.

viii. Given the failure of successive attempts to ban swidden (jhum, podu) cultivation in which women are especially involved, it is necessary to develop and diversify swidden with multiple species and high value crops (medicinal, aromatic plants) to increase diversity, enhance food security and perhaps improve women’s income.

ix. Resource support, value addition and market linkages for the traditional crafts in which farming women are involved, either full time or as supplementary activities, need special attention.
16. Labour and employment generation: Wage employment is still and will continue to remain the most important source of income for the rural poor, especially women, and hence the primary need is to revive and strengthen capital investment in agriculture and rural infrastructure, which will generate farm and non-farm employment. In this context, the NREG Act as well as six major schemes - National Horticulture Mission, Bharat Nirman (New Deal for Rural India), National Rural Health Mission, *Krishi Vigyan Kendras* in all districts (ideally to be re-designed as *Krishi aur Udyog Vigyan Kendras*), setting up of SHG Capacity Building and Mentoring Centres (as recommended by the NCF), and establishing women-managed Community Food, Water, Fodder and Feed Banks – provide immense scope for employment of poor rural women. Equally important, the new policy arrived at after a series of Round Tables of State Ministers and Secretaries for Panchayati Raj have arrived at new modalities for disbursement of funds to Panchayats, and for the planning process, which is now to be initiated at the level of Gram Panchayat and built up from below. Major Central schemes are now to be channeled directly to Panchayats. Safeguards have been built in to ensure that the funds are not delayed in payment.

It is hence recommended that:

i. There should be adequate representation of women in all bodies at Gram Panchayat, Block and District levels in all bodies concerned with generating, planning, designing and implementing employment. For example, a) Standing Committee on Planning of the Panchayats at village, Block and District level b) Technical Support groups set up at each level c) All Standing Committees at the three levels. In the Sixth Schedule areas where the 73rd Amendment does not apply, the engendering of traditional institutions at the village level should be encouraged and supported.

ii. There should be similar adequate representation of women in all bodies concerned with training and capacity building at village, Block and District levels – a) in setting up of raining and capacity building institutions and b) in planning the content and methodology of training.

iii. Forty per cent of all employment generated through new schemes should be reserved for women.
iv. Similar reservation should be made for the support services arising out of new employment opportunities for women to ensure not only that women’s services are utilized, but that their labour is recognized and their knowledge and skills built up.

v. Increased emphasis should be placed on implementation of Minimum Wages, Equal Remuneration and other existing laws.

17. Common Property Resources and NRM: Increasing illegal encroachment on common property resources (village grazing lands, ponds etc) with the approval of the local authorities, PRIs and traditional community authorities, who are often governed by patriarchal values and may not be gender sensitive, has severe consequences for the poorest and most marginalized, especially women, who depend on CPRs for livelihood. So does disposal of wastelands to commercial interest. In order to prioritise livelihoods of the poor/women over commercialisation it is recommended that:

i. 17.1 To discourage local authorities, Gram Panchayats or equivalent body from commercial disposal of village CPR and wastelands, they should be required to place such issues before the Gram Sabha for decision, in order to ensure that voices of marginalized sections (women, dalits and poor) are not excluded.

ii. 17.2 Awareness generation should be enhanced at all levels, and especially among the bureaucracy and local level traditional and elected bodies, to support poor women/marginalized groups in their struggle to protect their existing use rights over CPR.

iii. 17.3 Institutional and funding support for the formation of women producers’ associations to process, transport and market farm produce, milk, fish, crops etc. should be provided.

iv. 17.4 Commercial interests/companies should be banned from acquisition of wastelands for purposes of direct cultivation. CBOs (women’s groups, Dalit groups, tribal groups, SHGs) should be given priority for acquisition, lease, or grant of wastelands for cultivation.
v. 17.5 Since submergence of ecologically important watersheds, pastures and agricultural lands through hydro-electric schemes in the hills has a far-reaching impact on women’s livelihoods in both the upland and downstream areas, run-of-the-river schemes should be preferred to reduce displacement of people and erosion of agrobiodiversity.

vi. 17.6 Monopolies in the NTFP trade in different States and for different produce should be reduced with a view to their ultimate elimination and to ensure fair prices to the producers.

vii. 17.7 Different kinds of social networks of women producers (or of women and men) that already exist should be strengthened to enhance their ability to negotiate with traders and others.

viii. 17.8 The question of individual vis-a-vis common property resources needs to be carefully studied and addressed, so that public policies do not erode systems of common access and use even as they ensure individual rights, both of which are important.

18. Support services - The various social services provided by the State and community groups, such as health services, child care services, early childhood education, midday meals, ration shops are generally perceived, both by the concerned departments and the public at large as welfare measures. Their role as support services for poor women is less understood, and hence close linkages are not established, nor at the programmes adequately structured to be flexible in addressing these needs in a context-specific manner. Hence, it is recommended that:

i. ICDS should be redesigned to become more context and gender sensitive to the needs of poor working women, especially in the rural areas, by a) its decentralization and management by PRIs and b) enabling local managements to modify the timings, location, provision for care of younger children, child: worker ratio to suit local needs c) providing additional funds from sources such as NREG/ powers to raise additional funds to meet such context-specific needs.
ii. Innovative proposals to provide crèches for young children (below three) and cooked meals on site for women labour should be worked out in the case of NREG work-sites, which can be adapted elsewhere.

iii. Identity cards for migrant women workers should be provided to enable them to access PDS, secure admission to primary school/anganwadi/ etc for their children.

iv. The social security provisions in the two Acts before Parliament relating to unorganized workers should specifically include all categories of women workers in the agricultural and rural sector.

v. Common facility (meeting place/workshed) for women should be provided from the Gram Panchayat Mahila Kosh, (as already proposed in the First Report of NCF, Chapter IV on New Deal for Women in Agriculture).

19. Self-Help Groups - The tremendous expansion and visibility of SHGs in the last decade and a half has brought many gains, both social and economic, to poor rural women, though there are marked regional differences. There is debate about the extent and nature of gains, as increasing burden of work and responsibility on women, increased domestic violence, limited economic advancement, continuing social and caste oppression, and constraints to decision making in the home have also been observed. While recognizing the tremendous employment potential of SHGs, the continuing dependence of poor women on multiple sources of livelihoods implies that there are no panaceas, and multiple solutions have to be sought. At the same time, empowerment of women at the political, community, family and social levels is emerging as a precondition for further gain. It is hence recommended that:

i. Critical and region-specific studies of the SHGs drawing on available studies and data should be taken up to look into the financial, economic-productive, social-community, political, family-household, and personal levels of women’s empowerment.

ii. Based on such studies, a more detailed understanding of the place of SHGs in women’s multiple livelihoods may be built up, as well as mapping the location of women in the rural and agricultural sector.
iii. The banking system should be urged and enabled to develop a broad structure of varied financial services to support the multiple livelihoods of rural poor women, using the SHGs as the basic organisational structure.

iv. A network of capacity building institutions should be set up to strengthen and develop SHGs to undertake the various functions into which they are expanding, including ToT, and to nurture and mentor them during the process.

v. A series of training modules should be developed and delivered through various mechanisms including AIR and mass media, distance education providers, Village Knowledge Centres with the help of ICT.

vi. Awareness creation through mass media, people’s organisations, and networks should be used to create visibility, not only for SHGs and their achievements, but for the role of women in the economy.

6. Data-gathering and use - The importance of gender-disaggregated data in all fields and areas cannot be over-emphasised, not only in order to create visibility for the role of women in the economy, society and polity, but also as a tool for planning, monitoring and evaluation. It is equally important that in future all records and documentation of all types are gendered, for the same purposes. The endeavour should be to make the process of data-gathering participatory and to include qualitative measures of development and poor women’s lives and livelihoods. Measures of gender equality including the gender disaggregated data collected and collated through the different recommendations above, should not be an academic exercise but be incorporated into agricultural and related development policies. Hence, it is recommended that:

i. Time use studies should be extended to all the States, and should be repeated at regular intervals. These will strengthen the process of creating visibility for women’s unpaid labour and domestic work.

ii. Discussions with the national data-gathering agencies should be initiated by the concerned Ministries (Ministry of Agriculture) to continue and strengthen the process of gender-disaggregated collection of basic information through the decennial Census, the National Sample Surveys, and other occasional and regular data collection surveys of all Departments.
iii. Gender-disaggregated data on vital statistics should be collected through District level surveys, which would enable estimates of district level IMR, U5MR, MMR, JSR, and other important development indicators.

iv. The next Agricultural Census should collect gender-disaggregated data on operational holdings.

v. To begin the process of estimating women’s contribution to GDP, pilot studies at district level should be initiated to work out the methodology for such calculation.

vi. The responsibility for collecting gender-disaggregated information on vital statistics should gradually be shifted to PRIs, after ensuring that a) the elected leaders as well as the concerned functionaries are sensitized to its importance and the methods needed and b) that the necessary funds and facilities are transferred to them.

vii. Institutions must be sensitized to the need to maintain records of the representation of women in all committees.

7. Skill Empowerment and Technology for Women

7.1 Technology for women requires special attention and the impact of major on-going schemes (and any future schemes) on the knowledge and skills of poor, rural women engaged in farming and allied activities needs to be systematically studied. The lack of tools designed with women in mind is yet another area of concern. With the objective of empowering women in all fields of environmental management, including water harvesting, wasteland development, sustainable agriculture and livestock development, biodiversity conservation and its sustainable and equitable use, ongoing schemes should be “engendered” on priority basis. The National Commission on Farmers was requested to develop a strategy and set up mechanisms to advise on “engendering” four major programmes where women’s concerns should receive attention. These are:

- National Horticulture Mission
- Bharat Nirman Programme
- Capacity Building and Mentoring Centres for SHGs
- Revitalisation of Krishi Vigyan Kendras
7.2 All of these programmes need to be assessed in order to see firstly, how the present design impacts on poor women and secondly, whether and how these could be used to strengthen women’s capacities. Skill development of women will be a major focus, and the engendering of these programmes can offer a guideline for the inclusion of women in other technology-based or technology-rich programme areas.

8. Research - The NCF chairman’s suggestion to set up a national level action and policy research network to carry out longitudinal studies of women’s roles in agriculture and rural livelihoods in the various agro-ecological regions of the country was strongly endorsed. The network can be on the lines of a Hub and Spokes model, with the hub centre performing servicing, facilitating and integrating roles, and mobilising the power of partnership for women’s empowerment in agricultural and rural development.
ACKNOWLEDGEMENT

National Commission on Farmers acknowledges the valuable technical contributions of Ms. R.V. Bhavani, OSD to Chairman, NCF and Research Officers: Dr. (Ms.) Laxmi Joshi, Dr. Deepak Rathi, Dr. Pavan Kumar Singh, Dr. Ramesh Singh and the sincere work of Research Assistant, Dr. Prabhu Dayal Chaudhary and the secretarial staff of the Commission for the preparation of the Third Report.

TERMS OF REFERENCE
FOR
NATIONAL COMMISSION ON FARMERS

- Work out a comprehensive medium-term strategy for food and nutrition security in the country in order to move towards the goal of universal food security over time.

- Propose methods of enhancing the productivity, profitability, stability and sustainability of the major farming systems of the country based on an agro-ecological and agro-climatic approach and the harnessing of frontier technologies.

- Bring about synergy between technology and public policy and recommend measures for enhancing income and employment potential in rural areas through diversification, application of appropriate technology including IT for information on market, weather, credit facilities and e-commerce, training and market reforms.

- Suggest measures to attract and retain educated youth in farming and recommend for this purpose; methods of technological upgrading of crop husbandry, horticulture, animal husbandry, fisheries (inland and marine), agro-forestry and agro-processing and associated marketing infrastructure.

- Suggest comprehensive policy reforms designed to enhance investment in agri-research, substantially increase flow of rural credit to farmers including small and marginal, triggering agricultural growth led economic progress, which can lead to opportunities for a healthy and productive life to rural families.

- Formulate special programmes for dryland farming for farmers in the arid and semi-arid regions, as well as for farmers in hilly and coastal areas in order to link the livelihood security of the farming communities living in such areas with the ecological security of such regions. Review in this context, all ongoing Technology Missions like those relating to pulses, oilseeds, maize, cotton, watershed etc. and recommend methods of promoting horizontal integration of
vertically structured programmes. Also suggest credit-linked insurance schemes which can protect resource poor farm families from unbearable risks. Further, suggest methods of strengthening and streamlining the National Horticulture Development Board.

- Suggest measures for enhancing the quality and cost competitiveness of farm commodities so as to make them globally competitive through providing necessary facilities and application of frontier science and promote quality literacy for codex alimentarius standard, sanitary and phyto-sanitary measures among farmers through reorienting and retooling extension machinery. Also suggest methods of providing adequate protection to farmers from imports when international prices fall sharply.

- Recommend measures for the credit, knowledge, skill, technological and marketing empowerment of women, taking into consideration the increasing feminization of agriculture and the proposed conferment of right to land ownership.

- Suggest methods of empowering male and female members of elected local bodies to discharge effectively their role in conserving and improving the ecological foundations for sustainable agriculture like land, water, agro-biodiversity and the atmosphere with priority attention to irrigation water.

- Consider any other issue, which is relevant to the above or is specially referred to the Commission by Government.

The Commission is to submit a medium term policy for food and nutrition security in the country in order to move towards the goal of universal food security over time within the next three months and to submit its recommendations on other Terms of Reference as soon as practicable and in any case on or before 13th October, 2006. The Commission, however is permitted to submit interim reports on any of the Terms of Reference it deemed fit or expected of it.

[Ministry of Agriculture Resolution No.8-2/2003-Policy(ES) dated 18th November, 2004]
COMPOSITION OF THE
NATIONAL COMMISSION ON FARMERS

The composition of the reconstituted National Commission on Farmers is as under:-

Chairman

Prof. M.S. Swaminathan

Full-time Members

Dr. Ram Badan Singh
Shri Y.C. Nanda

Part-time Members

Dr. R.L. Pitale
Shri Jagadish Pradhan
Ms. Chanda Nimbkar
Shri Atul Kumar Anjan

Member Secretary

Shri Atul Sinha

[Ministry of Agriculture Resolution No.8-2/2003-Policy (ES) dated 18th November, 2004]
CHAPTER 1

ENDING THE ERA OF FARMERS’ SUICIDES AND LOW AGRICULTURAL GROWTH RATE: SYNOPTIC ACCOUNT OF NCF RECOMMENDATIONS

1.1 Introduction

1.1.1 NCF has so far submitted three Reports to the Union Agriculture Minister - on 29 December 2004, 11 August 2005 and 29 December 2005 respectively. The Fourth Report, *inter alia* containing a Draft National Policy on Farmers is being submitted to the Union Agriculture Minister on Vaisakhi Day i.e. 13 April 2006.

1.1.2 2005 was a difficult year both for the nation and for farm and fisher families. Beginning with the titanic tsunami of 26 December 2004, and ending with the disastrous earthquake in Kashmir and floods in Tamil Nadu, our farm and fisher families have been subjected to the fury of nature in the form of drought, unseasonal and heavy rains (like the one which caused damage to the onion crop in Maharashtra) and floods. Institutional support to small farmers is weak. The same is true of post-harvest infrastructure. For example, even now paddy is being spread on the roads for drying in many places. The spoilage losses can be as high as 30% in the case of vegetables and fruits. Institutions, which are supposed to help farmers, such as research, extension, credit and input supply agencies, are by and large not pro-poor and pro-women. Mechanisms for risk mitigation are poor or absent. Hardly 10% of farmers are covered by crop insurance. Farm families are also not covered by health insurance. There is no Agricultural Risk Fund. Both risk mitigation and price stabilization are receiving inadequate policy support. According to farmers, the cost of production is invariably higher than the Minimum Support Price, due to ever increasing prices of diesel and other inputs. Investment in agriculture has suffered a decline over the past two decades. Capital formation in agriculture and allied sectors in relation to GDP started declining in the 1980s and is only now being reversed. This has adversely affected irrigation and rural infrastructure development. Investment on
agriculture research has also suffered a decline. An unfortunate consequence of the constellation of hardships faced by small farm families is the growing number of suicides among farmers. The situation is particularly alarming in the Vidharbha region of Maharashtra and in Andhra Pradesh.

1.1.3 The cost-risk-return structure of farming is becoming adverse. Consequently, indebtedness is growing in rural areas. In Maharashtra over 55% of the State’s farm households are in debt. Average household size of farmers is 5.5 at the all-India level. In the low-income groups, the average size goes up to 6.9. According to NSSO-59th round, the average monthly per capita consumption expenditure of farm households across India was Rs. 503 in 2003. The all India average monthly income per farmer household during the same period was Rs.2115. (The figure was Rs.1062 for Orissa and Rs.1633 for UP). Endemic hunger (i.e., chronic undernutrition), is high both in families without assets like land or livestock, as well as in families with small land holdings without access to irrigation. Policy reform in agriculture is thus overdue. Such policy reform should be pro-small farmer and pro-women and pro-landless agricultural labour. If we do not attend to the problems of small farm and landless agricultural labour families with a sense of urgency and commitment, the “Indian Enigma” of the co-existence of enormous technological capability and entrepreneurship on the one hand, and extensive undernutrition, poverty and deprivation, on the other, will not only persist, but will lead to social disruption and violence and increasing human insecurity. Without peace and security, enduring economic progress will not be possible. NCF therefore recommends that the agricultural year 2006-07 be designated as the Year of Agricultural Renewal.

1.1.4 During this year an integrated package of measures should be introduced in every part of the country to increase farm productivity and profitability in perpetuity without associated ecological harm. The programmes should cover all our major agro-ecological regions-arid, semi-arid (i.e. dry-farming) hill, coastal and wet (i.e. irrigated or high rainfall) zones. The present agricultural crisis can then be converted into an opportunity for not only reversing the decline, but for taking the agricultural revolution forward by helping farm families to bridge the gap between potential and actual yields in all major
farming systems through mutually reinforcing packages of technology, services and public policies. The programmes initiated during the 2006-07: Year of Agricultural Renewal by Central and State Governments, Panchayati Raj institutions, Agricultural, Veterinary, Rural and Women’s Universities and IITs, Private and Public Sector Industries, Civil Society Organisations and Mass Media should be designed to foster productivity, quality, sustainability, profitability and employment revolutions in the farm sector in all the over 600,000 villages in the country. It should help to promote job-led economic growth in our villages.

1.1.5 It is felt that declaration of the year 2006-07 as the “Year of Agricultural Renewal” would be a positive step towards an Evergreen Revolution in Agriculture. The recommendations of the NCF contained in its three Reports would help in achieving a growth rate of 4 percent in agriculture, which in turn would help to raise the overall growth rate in GDP to over 8 percent.

1.2 Synopsis of Recommendations:

1.2.1 The major recommendations in the first three Reports of the NCF are summarized below under the heads of Land, Water, Credit and Insurance, Technology and Markets – the five core areas needing urgent attention to make farming a viable activity for farmers.

1.2.2 Land

There is an urgent need for a National Land Use Advisory Service, linked to State and Block Level Land Use Advisory Services on a hub and spokes model. These can be virtual organizations with the capacity to link land use decisions with ecological, meteorological and marketing factors on a location and season specific basis. The National Land Use Advisory Service can be linked to a virtual body – the Indian Trade Organisation (ITO) (discussed in details in the Third Report). It should have continuous contact with IMD, ISRO, Agricultural Universities and Departments, Commodity Exchanges and Futures Markets, APEDA, Commodity Boards and all credible national and international sources of information on domestic and international markets. The Land Use Advisory Service should cover crop and animal husbandry, horticulture, inland
fisheries, forestry and agro-forestry, and have the capacity to proactively assess potential surpluses and shortages of essential commodities. Revitalize and strengthen National and State Land Use Boards on the pattern of hub and spokes model, to give proactive advice to farmers on crops.

i. Commemorate 2006-07 as the year of **Soil Health Enhancement**. Soil Health Enhancement holds the key to improving the return from investment in other inputs like seeds and water. Dry farming areas need particular attention from the point of view of overcoming micro-and macronutrient deficiencies. As stressed by the Prime Minister, the second green revolution has to begin in dry farming areas

ii. Retool and rejuvenate soil-testing laboratories to address the problems of micronutrients deficiency in soil. **Establish a national network of 1000 sophisticated soil testing laboratories.**

iii. Issue **Soil Health Passbook to every farm family** based on an integrated analysis of the physical, chemical and microbiological properties of the soil.

iv. Organize **Travelling seminars** for farm men and women to learn the factors responsible for “agricultural bright spots”, with priority to horticulture. Another method of facilitating Farmer-to-Farmer learning is the establishment of **Farm Schools** in the fields of farmers-achievers.

### 1.2.3.1 Water

i. Have a **Policy of Water for Agriculture**. Converge all Technology Missions around a Watershed or Command Area

ii. Launch a Million Wells Recharge Programme, Rebuild water bodies and bring about greater integration between currently fragmented programs.

iii. Launch a Water Literacy Movement, training Water Masters in every Panchayat. **Increasing supply through rainwater harvesting and recharge of the aquifer should become mandatory**

iv. Set up National Rainfed Area Authority to help in converting scientific know-how into field level do-how through large-scale demonstrations. The Authority should also help to foster water conservation, Pani Panchayats, scientific land use planning and assured and remunerative marketing.
v. Promote seawater farming for coastal area prosperity – pilot projects covering about 50,000 ha in all coastal states to demonstrate conjunctive use of sea and fresh water and forestry and aquaculture.

vi. Establish a National Research Centre on Glacierology for collection, storage and dissemination of information on status of seasonal/perennial snow and ice

vii. Launch a National Challenge Programme for Coastal Systems Research (CSR), for concurrent attention to coastal agriculture, agro-forestry, culture and capture fisheries

1.2.3.2 Water – Fisheries

i. Set up National Agency and Protocol of Seed Certification for Fisheries

ii. Set up an interdisciplinary Task Force to address need for a comprehensive set of Aquarian Reforms in order to foster sustainable and equitable use of both coastal and inland waters for capture and culture fisheries.

iii. Organize centralized support services to support decentralized small scale production (e.g. Mother Ships based in Andaman & Nicobar and Lakshadweep Group of Islands), upgradation and construction of new minor fish harbours and fish landing centers, large wholesale markets for larger and more hygienic handling of catch and greater employment generation.

iv. Set up a Central Fishery Harbour Development Authority.

v. Set up a National Fisheries Development Board to provide technical and infrastructural support to fisher communities, particularly in the areas of fish processing and marketing as well as in fish seed and feed production and distribution.

vi. Hike subsistence allowance per fisher family from Rs. 300 to Rs. 1500 per month for better enforcement of close season. There should be a Contributory Provident Fund and Pension Scheme for fishers above 60 years of age.

vii. Establish ‘Fish for All Training Centres’, which will enhance the capacity of fisher women and men in all aspects of the capture to consumption chain.
1.2.4 **Credit and Insurance**

i. Introduce an integrated **Parivar Bima Policy** for the rural poor for providing hospitalization expenses, life cover for deaths/disabilities and cover for dwelling units. This should be linked to self-help groups and largely funded by the contribution of Members.

ii. Launch a drive for credit and insurance literacy amongst farmers. Set up a **Rural Insurance Development Fund** for promoting insurance coverage.

iii. **Keeping in view the decline in the profitability of agriculture, and increasing farmers’ distress and indebtedness**, the government may consider providing support to the banking system for reducing the rate of interest for crop loans to 4% during the Year of Agricultural Renewal.

iv. The outreach of the formal credit system has to expand to reach the really poor and needy.

v. There is an urgent need for a **paradigm shift from micro-finance to livelihood finance**, comprising a comprehensive package of support services including financial services, [including insurance for life, health, crops and livestock: infrastructure finance for roads, power, market, telecom etc and investment in human development], agriculture and business development services [including productivity enhancement, local value addition, alternate market linkages etc] and institutional development services [forming and strengthening various producers’ organisations, such as SHGs, water user associations, forest protection committees, credit & commodity cooperatives, empowering Panchayats through capacity building and knowledge centres etc.].

vi. **Need for an Agri-risk Fund:** There are areas in our country, which have recurrent and frequent drought/floods etc, which cripple the incomes of the farmers. These farmers become defaulters to the banks and thereby become “push-outs” of the credit system. Rescheduling and restructuring of their loans are not enough in the event of successive natural calamities. The Government of India may step in to create an Agriculture-Risk Fund to provide relief [waiver in full/part of loan and interest] to the farmers in the case of successive droughts, etc.
and also waiver of interest on loans in areas hit by droughts, floods, heavy pest infestation etc. This Fund should have contributions from the Central Government, State Governments and Banks in a predetermined fashion.

vii. **Distress ‘hot spots’ – moratorium on debt recovery:** There is a need for moratorium on debt recovery including loans from non-institutional sources in distress hotspots, till reasonable profit margins in agriculture operations are restored. The debt recovery may be staggered in easy installments. For this purpose, liquidity support may have to be provided to the localised banks like the RRBs/Cooperative Banks etc.

viii. **Issue of Kisan Credit Card (KCC) to women farmers:** Inspite of nearly 4.5 crore KCCs issued by the banks, very few cards have been issued to women farmers and no separate data are available in this regard. Keeping in view the fact that there are a very large number of women-headed farming families, particularly in the hills and NE Region, special effort is needed to issue KCC to these farmers. The banks may develop proper documentation systems to issue KCCs to women where the land is in the name of the menfolk who do not reside in the rural area [jobs in the cities/army etc] or face similar other situation and the land is cultivated by the wife.

ix. **Distress sale - need for pledge loans:** Distress sale by small/marginal farmers to square off their debts or for immediate consumption purposes soon after harvest is quite common. It is normal for a farmer to get 10-15% discounted price for spot payment for his produce. Pledge loans to farmers need to be liberalised and encouraged to help the farmers to overcome this problem. **The constraints in improving the negotiability of warehouse receipts also need to be removed.**

x. **Crop insurance** is covering only about 14% of the farmers. The need is to expand the cover to all farmers and all crops in a time bound manner. The scheme needs to be made more farmer-friendly and the premium reduced.

xi. Establish **Credit Counseling Centres** where severely indebted farmers can be provided with a **debt rescue package** of information in order to get them out of the debt trap, and thereby save them from committing suicide.
1.2.5 **Technology**

i. All ICAR institutions and Agricultural Universities may commemorate 2006–07 as the Agricultural Technology Year. The major aim of this year should be to strengthen participatory research and knowledge management with farming families and the organisation of about 60,000 Lab to Land programmes in the area of post-harvest technology, value addition to primary products and biomass utilization.

ii. A post-harvest technology wing should be added to every Krishi Vigyan Kendra and the help of other institutes like CFTRI and CSIR taken in designing the Lab to Land Programmes.

iii. Agricultural scientists should state the performance of new varieties and technologies in terms of **net income per hectare**, and not just in terms of yield per hectare.

iv. All programmes designed to foster access to technologies must be gender sensitive.

v. A cadre of Rural **Farm Science Managers** should be developed by training a couple of women and men members of every Panchayat/ local body in the management of new technologies, such as Biotechnology and information and Communication Technology. Under the 73rd Constitution Amendment, the responsibility of Panchayats includes agriculture and agriculture extension. **Therefore, a Scientist – Panchayat linkage is the need of the hour.** Genome Clubs may be organized in village schools and KVKs to spread genetic literacy.

vi. Develop Computerized Farm Advisory System; ICT should be effectively harnessed to empower rural men and women through the Every Village a Knowledge Centre Movement with farming system and season specific information as well as market and price information.

vii. Organize a National Federation of Farm Technology Missions headed by a farmer-achiever, which can help to bring to the watershed community the benefits of all other relevant Technology Missions like pulses, oilseeds, cotton, horticulture, dairy etc. Organize a Technology Mission on Sugarcane jointly
with sugarcane growers’ organizations and cooperatives and sugar factories on the basis of a seed-to-sugar approach. Set up National Mission on Medicinal and Aromatic Plants. The National Medicinal Plants Boards needs to be restructured and re-tooled, to enable it to function like NDDB.

viii. **Put in place a National Agricultural Biosecurity System** on a hub and spokes model - to help in preventing pandemics like Avian Flu (H5N1 viral strain)

ix. Provide greater research support for Organic farming. Research on soil fertility enhancement and plant health management has also to be strengthened.

x. Facilitate setting up of Agriculture and Aquaculture Service Centres, equipped with a laboratory, storage facilities for inputs and with communication facilities and run by trained managers who are available to the farmers to provide reliable technical advice, arrange for procurement of quality seed, feed, probiotics, provide information on the market and price fluctuations, should be set up with the active involvement of the farmers in different production areas.

### 1.2.6 Markets

i. **Amendment to Acts/legal instruments:** The Essential Commodities Act and other legal instruments including the State Agriculture Produce Marketing Committee Acts [APMC Acts] relating to marketing, storage and processing of agriculture produce need to be reviewed in order to meet the requirements of modern agriculture and attracting private capital in this sector.

ii. There is a need for focused attention for improving the **rural periodic markets**, which are the first contact point for the farmers and also for improving the infrastructure facilities at the regulated markets.

iii. The **role of the APMCs/ State Agriculture Marketing Boards** need to change from regulatory focus to promotion of grading, branding, packaging and development of distant and international markets for the local produce.

iv. **Commodity-based farmers’ organisations** like Small Cotton Farmers’ Estates, Small Farmers’ Horticulture Estates, Small Farmers’ Poultry Estates
and Small Farmers’ Medicinal Plants estates should be promoted to combine the advantages of decentralized production and centralized services, post harvest management, value addition and marketing, for leveraging institutional support and facilitate direct farmer-consumer linkage.

v. **Implementation of MSP** across the regions needs considerable improvement. Arrangements to protect the Minimum Support Price (MSP) needs to be put in place for crops other than paddy and wheat. These include coarse cereals like millets. Without MSP support or other effective need-based market intervention by the government, advice to farmers on crop diversification could lead to disastrous results. MSP should be adjusted according to the wholesale price index.

vi. The price behaviour of sensitive commodities needs to be closely watched particularly during the glut periods for need-based intervention under the ‘Market Intervention Scheme’ [MIS] of the Government of India.

vii. **Import tariffs** on farm products produced in resource poor regions deserve to be carefully monitored and maintained at such levels as to provide sufficient incentives to dryland farmers.

viii. **Pre–production Agreements to sell:** Pre-production agreements for sale (loosely referred to as ‘contract farming’), between the farmers and corporate houses/processing companies/others are being increasingly used in the case of certain vegetables/fruit/medicinal plants etc. The need is to develop a comprehensive, clean, equitable and farmer centric model agreement with special attention to clauses dealing with quality standards, withdrawal conditions, pricing standards, paying arrangements, acts of God clauses and arbitration mechanism, so that the farmers do not get a raw deal. Till such a code of conduct is introduced and the farmers are empowered by formation of groups/cooperatives to deal with the agribusiness unit on their behalf, one has to be rather cautious about these arrangements.

ix. Set up a **Livestock Feed Corporation of India** jointly with NDDB, SFAC and NABARD to provide support to local level SHGs engaged in the production of fodder and feed and in organizing Fodder and Feed Banks.
x. Identify **Organic farming zones**, to facilitate certification. In such zones, promote the formation of Small Farmers’ Organic Agriculture Estates: Develop Andaman & Nicobar Islands into Organic Farming Islands.

xi. Develop **an Indian Single Market** for agricultural produce for strengthening producer oriented marketing to give power of scale to small producers.

xii. Promote trade, patent, quality and genetic literacy

1.3 **Other Key Recommendations**

1.3.1 **Medium term strategy for Food and Nutrition Security** – Six Point Action Plan for Hunger Free India

a. Reform of the Delivery System based on a life cycle approach to food and nutrition security.

b. Community Food Security Systems – Community managed Gene-Seed-Grain-Water bank Continuum

c. Eradication of Hidden Hunger based on natural cum food fortification approaches

d. New Deal for the Self-Employed (Establish SHG Capacity Building and Mentoring Centres, Paradigm shift from Microfinance to Livelihood Finance)

e. Enhance the Productivity and Profitability of Small Holdings to increase marketable surplus

f. Introduce a National Food Guarantee Act combining the features of the National Rural Employment Guarantee Act and Food for Work Programme.

1.3.2 Introduce a **Farmers’ Livelihood Security Compact** comprising of the following integrated package of measures to step up credit and generate employment in suicide hotspots:

a) **Set up State level Farmers’ Commission** as has already been done by the Punjab Government for ensuring dynamic government response to farmers’ problems. Farm men and women should be represented in the Commission.

b) **Undertake a Census of Suicides** to have a proper understanding, assessment of reasons and count of suicides.
c) **Micro-finance policies should be restructured to serve as Livelihood Finance**

d) Initiate a **Debt survey** to take into account newer forms of credit and indebtedness and newer forms of bondage.

e) **Debt waiver** - The amount that is to be the cut-off point could be worked out in consultation with Panchayats and farmers’ representatives in the distress hotspot areas.

f) **Insurance revival:** There are provisions in the insurance laws that allow LIC to revive lapsed policies.

g) **Parivar Bima Policy:** The integrated family insurance policy recommended by NCF in its first report deserves to be examined and introduced to begin with, in dry farming areas.

h) **Policies for Irrigation Water:** Water conservation, equity and fairness and public good will have to be the basis of water policies. Irrigation policies need to be viewed in a holistic manner and made pro-poor.

i) **Revising import policies:** Some swift action on import duties of cotton for instance is a must in the light of large number of suicides by Vidharbha’s poor cotton farmers. Other crops need to be similarly protected.

j) **Access to affordable inputs is crucial:** The government must urgently intervene to ensure that quality seed and other inputs reach farmers at affordable costs and at the right time and place. Resource poor farm families should not be left to the mercy of input dealers who have emerged as the new moneylenders of the countryside. The maximum punishment for selling fake seed (except where new laws have been passed) is a meagre Rs. 500.

k) **Overhauling farmers’ markets:** Swift action is required to overhaul the **ryuthu bazaars** or farmers’ markets. Most of these are presently controlled not by farmers but by traders, from whose control they must be released. Amendments to APMA, as suggested by the Union Agriculture Ministry, need to be carried out by State Governments as soon as possible. There is also need for introducing focused **Market Intervention Schemes** (MIS) in the case of life-saving crops such as cumin in arid areas.
a. **Extension work:** The vital role of the Agriculture Extension Officer must be recognised and the system revived and strengthened. *Agricultural and Animal Sciences Universities could form Hope Generation Teams* (like NSS) of young male and female students who could stay in the distress villages during vacations and extend both technical and psychological support. The universities must be accountable to the farming community and not to private interests.

b. **Basic services:** The distress sweeping rural India flows from the gradual collapse of public services. For instance, almost all the suicide and otherwise crisis-hit households record high health expenditures. There is urgent need for both affordable health insurance, and the revitalization of primary healthcare centres.

c. **Knowledge Empowerment:** In addition to the above steps, there is need for establishing Village Knowledge Centres (VKCs) or *Gyan Chaupals* in the farmers’ distress hotspots. These VKCs could be linked to a Block level Village Resource Centre (VRC) with the help of the Indian Space Research Organisation (ISRO). This will enable tele-conferencing and thereby facilitate immediate attention to distress calls. The VRC-VKC grid could provide dynamic and demand driven information on all aspects of agricultural and non-farm livelihoods. These centres of hope in areas where rural families had lost hope, should be operated to the extent feasible by the wives or children of the farmers who had unfortunately taken their lives.

### 1.3.3 Policy for Women in Agriculture

a. Issue joint pattas to ensure land ownership rights to women

b. Set targets State-wise for at least 40% of government land distributed to SC/ST to go to the women of these communities.

c. Allocate land in State Farms (both Central and State) to women SHGs engaged in the production of seeds and planting material for horticultural crops including medicinal plants.
d. **A Gram Panchayat Mahila Fund** should be established to enable SHGs and other women’s groups to undertake community activities that help to meet essential gender specific needs.

1.3.4 **Set up a Heritage Gene Banks** to protect livestock heritage

1.3.5 Organize a separate **Department of Fisheries** in the Ministry of Agriculture.

1.3.6 **Rename Ministry of Agriculture as Ministry of Agriculture and Farmers’ Welfare**

1.4 Thus, the National Agricultural Renewal Year Programme of 2006-07, should deal concurrently with proactive advice to farmers on land use, soil health enhancement, augmentation of the area under irrigation coupled with efficiency and equity in water use, credit and insurance reform, technology up-gradation and dissemination, and farmer-centred marketing coupled with necessary policy and infrastructure support to address and redress the problems. Only such a human-centred approach to agricultural policies based on the strong foundations of the health and livelihood security of the majority of our farm population, which is also the largest consumer population in the country, will enable us to achieve an annual growth rate of 4% in agriculture on a long-term basis.
CHAPTER 2
JAI KISAN: DRAFT NATIONAL POLICY FOR FARMERS

(Draft for Comments, Public Debate and Consensus Building)

2.1 Why a National Policy for Farmers

2.1.1 At the time of our Independence, Jawaharlal Nehru said, “Everything else can wait, but not agriculture”. Unfortunately this profound truth is yet to be converted into concrete policies and action on an adequate scale. There have been several policy statements for agriculture during the last 59 years, including the comprehensive reports of the National Commission on Agriculture (1976). The last National Agricultural Policy was formulated in 2002. However, we are yet to place faces before figures and the problems of farm families as human beings and citizens of the country are yet to receive the attention they need and deserve. Agricultural growth has decelerated during the last decade. This has led to a decline in real per capita incomes in rural India, in comparison to the rapid growth in urban incomes. The present Draft Policy for Farmers is designed to fill this gap and to get the focus of our agricultural policies shifted to the women and men feeding the nation, thus moving away from an attitude which measures progress only in millions of tonnes of foodgrains and other farm commodities. Its main aim is to bring about a mindset change and a shift from an approach of patronage to partnership with farm and fisher families based on mutual respect. Progress in agriculture should be measured by the growth rate in the net income of farm families, if the human dimension is to be added to agricultural policies.

2.1.2 Farming is both a way of life and the principal means of livelihood for 65 per cent of India’s population of 110 crores. Our farm population is increasing annually by 1.84 per cent. The average farm size is becoming smaller each year and the cost-risk-return structure of farming is becoming adverse, with the result that farmers are getting increasingly indebted. Marketing infrastructure is generally poor, particularly in perishable commodities. No wonder, a recent NSSO survey revealed that nearly 40 per
cent of farmers would like to quit farming, if they have the option to do so. Unfortunately, there is little option for them except moving into urban slums.

2.1.3 The livelihoods of pastoralists and smallholder farmers are threatened by the progressive loss of grazing land for their animals, limitations to mobility, inadequate or inappropriate government policies, and lack of animal health and other services. These developments are also causing the progressive loss of the livestock breeds and species that provide rural livelihoods and life-style options.

2.1.4 The support systems needed by farmers, like research, extension, input supply and opportunities for assured and remunerative marketing are in need of review and reform. Small farmers are forced to borrow from moneylenders at high rates of interest, since only 51 per cent of the credit requirements of farmers are met by institutional sources. Only 27 per cent of all cultivator households receive institutional credit.

2.1.5 Farmers’ suicides are not only persisting but are tending to increase, particularly in the Vidharbha region of Maharashtra. The suicides are driven by several factors that include debt from private moneylenders at high rates of interest, soaring input costs, low output prices, need for funds for non-farm expenditure, particularly for healthcare and a complete loss of hope. The farmers of such regions need to be rescued from the pall of despair and doom. Unfortunately, the economic, ecological, technological and social problems facing small farmers are yet to receive the integrated attention they need, although the NCF had recommended in its Second Report submitted in August 2005, a life saving package, including the formation of “Hope Generation Teams” of students by Agricultural Universities, to visit suicide hotspots.

2.1.6 The social prestige and status accorded to farmers are also low. Farmers seldom receive recognition through Padma Awards on Republic Day - an index of the low recognition given to the contributions of 650 million farm women and men not only to food and livelihood security, but also to national sovereignty. Lal Bahadur
Shastri’s slogan “Jai Kisan” is yet to be converted into public policies which recognise the pivotal role of farming communities in national well-being and security.

2.1.7 Policies are needed for making the farming operators sub-marginal, marginal and small farmers economically viable and environmentally sustainable. Well-defined guidelines are needed for assisting such families with assured and remunerative marketing opportunities, particularly in the case of perishable commodities, and ‘orphan’ crops like a wide range of millets, tubers, pulses and oilseeds.

2.1.8 Technology has been a major factor in the rich-poor divide until now. We should now enlist technology as an ally in the movement for gender and social equity. This will call for a pro-poor, pro-women and pro-nature orientation to technology development and dissemination. Also, Intellectual Property Rights (IPR) policies should be such that there is social inclusion in access to technologies. This will call for a considerable stepping up of investment in public good research and an antyodaya approach to technology development and dissemination. There is no option except to produce more food and other commodities under conditions of diminishing per capita arable land and irrigation water resources. Hence, we must harness the best in frontier technologies and integrate them with traditional wisdom and thereby launch an ecotechnology movement.

2.1.9 Research should be tailored to the need for developing technologies which can help to add economic value to the time and labour of the poor, particularly women. Also, the advantage of the National Rural Employment Guarantee Programme (NREGP) should be taken for launching a massive adult and functional literacy programme using modern computer-aided joyful learning techniques. The poor are poor because they have no assets, neither land nor livestock nor fishpond. They are often illiterate also. Modern technologies can help to achieve a quantum jump in imparting literacy and market-driven skills. They should therefore be harnessed for the benefit of resource poor farm and
landless labour families living below the poverty line. Further, the NREGP should be used to create productive assets in rural areas.

2.1.10 Within a week after the launch of NREGP, 2.7 million applicants reportedly registered themselves for employment under this programme in 13 districts of Andhra Pradesh and a million registered in 12 districts of Maharashtra. The average wage under this programme is about Rs. 60 per day. While this will help them to get their daily bread, the programme cannot solve the challenge of pervasive poverty. Since NREGP represents employment of the last resort and caters only to unskilled work, the extent of despair and deprivation in rural India is obvious from the demand for placement in this programme.

2.1.11 Addressing the nutrition, healthcare and education needs of the poor, and particularly of agricultural labour, tribal women and men and fisher families should be given top priority. Nearly 75 per cent of children in the country are under-weight due to inadequate nutrition. India has the largest number of under-weight and low birth weight children and their prevalence is almost double that of Sub-Saharan Africa. Micronutrient deficiencies are widespread. More than 75 per cent of preschool children suffer from iron deficiency anaemia. About 57 per cent of preschool children have sub-clinical vitamin A deficiency. Many traditional food habits in rural and tribal areas included a wide range of millets, tubers and grain legumes. The revitalization of nutrition-centred farming systems is an urgent task. Both dying crops and dying wisdom should be saved and harnessed for local level community managed food security systems, like Community Food Banks.

2.1.12 While farm families are crying for additional investment in infrastructure and farm innovation, there has been a drop in government investment in the agriculture sector. The drop in government as well as private investment has significantly slowed down momentum in the entire rural economy. Public policies in the area of farm subsidies have led to distortions in land use and fertiliser consumption and have promoted the unsustainable exploitation of groundwater. The intensive wheat-rice
rotation in the Punjab-Haryana region has led to the depletion of groundwater and to soil salinisation in some areas. Balanced fertilisation has been affected by the heavy subsidy given to urea-based fertilisers, particularly in the context of a sharp rise in the prices of all chemical fertilisers. Soil micronutrient deficiencies are not being addressed. Consequently, factor productivity is going down, with a consequent adverse impact on the cost of production.

2.2 Silver Lining in the Dark Cloud

2.2.1 Fortunately, several significant initiatives have been taken during the last 2 years to reverse the downward trend in agricultural production and to find permanent solutions to the agrarian crisis. Some of the important new initiatives are:

- Bharat Nirman or a New Deal for Rural India.
- National Rural Employment Guarantee Programme.
- National Horticulture Mission.
- Expansion of agricultural credit and lowering of interest rates.
- National Rainfed Area Authority.
- National Fisheries Development Board.
- Changes in the Agriculture Produce Marketing Committee Act (APMC), to make them farmer-friendly.
- Integrated Food Law (currently the food processing industry is governed by 16 different laws).
- Warehouse Receipt Act, making warehouse receipts a negotiable instrument, thereby helping to prevent distress sales.
- Knowledge connectivity through the e-governance and Every Village a Knowledge Centre.

2.2.2 The time is therefore opportune for revitalising our agricultural progress by making agrarian prosperity the bottom line of government investment and agricultural and rural development policies.
2.2.3 Data and analysis relevant to the preparation of a Draft National Policy for Farmers are included in this chapter in order to provide the rationale underlying the recommendations. The conclusions of the Mid-term Appraisal of the Tenth Plan conducted by the Union Planning Commission are also included among the background documents (Annexure 1, Chapter 3.1), in order to emphasise the need to prevent a further fall in the productivity and economic viability of farming.

2.3 Next Steps

2.3.1 NCF is of the view that the process of preparation of a National Policy Statement is as important as the product. The present draft is the result of widespread consultations and field visits during the last 15 months. NCF proposes to provide a second draft in its fifth and final Report to be submitted to the Ministry of Agriculture on October 13, 2006, when the term of NCF ends. The second draft will be based on the views/comments on the present draft by Farmers’ and Fisher People’s Associations, as well as women’s organisations, State Governments, financial institutions, Self-help Groups (SHGs), Cooperative Federations, private and public sector companies, mass media and all other stakeholders. State Governments have a special responsibility, since agriculture is a State subject under our Constitution. NCF hopes that the Ministry of Agriculture will get the draft policy finalised by early 2007, so that the policy can be adopted by Parliament and the National Development Council on the occasion of the 60th Anniversary of our Independence.
2.4 Draft National Policy for Farmers

Box I

<table>
<thead>
<tr>
<th>Mission Statement</th>
</tr>
</thead>
<tbody>
<tr>
<td>• To mainstream the human dimension in all farm policies and programmes and to give explicit attention to issues relating to women in agriculture.</td>
</tr>
<tr>
<td>• To end the era of farmers’ suicides and to restore pride and confidence in India’s agricultural capability.</td>
</tr>
<tr>
<td>• To complete the unfinished agenda in land reforms and to initiate comprehensive asset and aquarian reforms in rural India.</td>
</tr>
<tr>
<td>• To enhance the income, livelihood, nutrition and health security of farm, fisher, tribal, pastoral and agricultural labour families through mutually reinforcing packages of technology, techno-infrastructure, services and public policies.</td>
</tr>
<tr>
<td>• To protect and improve the land, water, biodiversity and climate resources essential for sustained advances in the productivity, profitability and stability of major farming systems, and thereby the livelihood security of nearly two-thirds of our population.</td>
</tr>
<tr>
<td>• To introduce measures which can help to attract and retain youth in farming and which can confer the power of scale to small and marginal farmers both in the production and post-harvest phases of farming, thereby enhancing their income and competitiveness.</td>
</tr>
<tr>
<td>• To strengthen the biosecurity of crops, farm animals, fishes and forest trees for safeguarding both the work and income security of farm and fisher families, and the health and trade security of the nation.</td>
</tr>
</tbody>
</table>

2.4.1 Definition

For the purpose of this Policy, the term “farmers” will include landless agricultural labourers, sharecroppers, tenants, small, marginal and sub-marginal cultivators, farmers with larger holdings, fishers, dairy, sheep, poultry and other farmers involved in animal husbandry, pastoralists, plantation workers, as well as those rural and tribal families engaged in a wide variety of farming related occupations such as sericulture and vermiculture. The term will include tribal families sometimes engaged in shifting cultivation and in the collection and use of non-timber forest products. In all cases, both men and women will receive equal attention. This Draft Policy aims to suggest methods of improving the income and work security of such citizens of the country who not only constitute the genuine majority of our population, but also represent the largest private sector enterprise of the country.

2.4.2 Ending the Era of Farmers’ Suicides

2.4.2.1 We live on this earth as guests of the green plants which convert sunlight into food, and of the farm women and men who toil in sun and rain to cultivate them. It is
therefore sad and shameful that the very farmers making life possible for others are forced to take their own lives. **Ending this chapter in our national history must be the first and foremost task of Government.** From its first Report, NCF has been giving both generic and location specific recommendations to end this sad chapter of our agricultural history. A ‘Livelihood Security Compact’, programme for instilling hope in the minds of those farmers who have lost all hope, and specific steps for solving the Vidharbha agrarian crisis have been proposed in the earlier Reports of NCF. The establishment of Village Knowledge Centres managed by the widows and/or sons and daughters of the farmers who have taken their lives will help to spread the right information, at the right time and to the right people, particularly in the areas of credit, insurance and trade literacy. Such a programme is being launched on May 1, 2006 (Maharashtra Day) at Nagpur. Also, the ‘Hope Generation Teams’ to be set up by Agricultural Universities should start functioning immediately, since the summer vacation will afford an opportunity to scholars and staff to stay in the ‘Suicide Hot Spots’ and spread a message of confidence in our agricultural future.

2.4.2.2 Ours is a nation of subsistence farmers, who constitute one fourth of the global farm population. There is little or no evidence that policy is being shaped by that reality. Farming is the largest people’s private sector and not a corporate domain. The immediate step Government must take is to implement the NCF recommendation for a Price Stabilisation Fund. While a multiplicity of factors is driving the farm suicides, the greatest worry of the farmers relates to the price he is likely to get for his produce at harvest time. This has proved true regardless whether the produce is cotton, onions, groundnut, sugarcane or pulses. **Assured and remunerative price for farm produce is the core issue. Farmers should be assured that there will be strong Government intervention to prevent distress sales.**

2.4.2.3 There are no conclusive figures on the number of farmers’ suicides. According to media reports, it appears that this number may be about 30,000 across six States. There is need for a proper “Suicides Census”. Gram Sabhas may be involved in this process. The review and overhaul of credit operations ought to be far more transparent and rigorous. The Indian Trade Organisation (ITO) should come into
existence soon as a watchdog body to safeguard farmers’ interests. The ITO could be supported by a Trade Advisory Body for Small Farmers. The objective would be to allow farmers to engage with decision makers in the formulation of appropriate policy responses to developments in agricultural markets.

2.4.2.4 Another area where the Central and State Governments can help is input costs. High quality inputs should be made available at affordable prices at the right time and place, along with credible extension advice. Today, the farmer depends on the input dealer who sells seeds, pesticides and fertilisers for technical advice. In many “Suicide Hot Spot” areas, the input dealer is also the moneylender, the scientist, agricultural expert, counselor and buyer all rolled into one.

2.4.2.5 NCF urges State Governments and all concerned not to place the underlying causes for the increasing number of farmers’ suicides under the carpet and delay action on its recommendations. Some immediate financial support to the bereaved families is important, but not adequate. Until such time we do not recognise the root causes of this sad chapter of our agricultural history, remedial actions will largely be cosmetic.

2.4.3 Asset Reform

2.4.3.1 The purpose of asset reform is to ensure that every man and woman in villages either possess or has access to a productive asset like land, livestock, fishpond, homestead farm or income through an enterprise, or a market driven skill, so that household nutrition security is safeguarded, and children are able to go to school. Child labour has to be rendered unnecessary by improving the economic wellbeing of the adults.

2.4.3.2 Land

2.4.3.2.1 The major assets available to farm families are land, water, livestock, biodiversity, fisheries and forestry. The ownership of land is highly skewed with over 60 per cent of the rural households owning less than one hectare. Farmers owning over one hectare comprise nearly 28 per cent of rural families. The landless population amounts to
11.24 per cent of rural households. These data relate to 1991-92 and it is obvious that by now there would have been further fragmentation of holdings leading to a much larger incidence of very small operational holdings. The slow growth of opportunities in the non-farm employment sector has led to the proliferation of tiny and economically non-viable holdings. **Increase in small farm productivity and creating multiple livelihood opportunities through crop-livestock integrated farming systems as well as agro-processing have become urgent tasks.** The first and foremost task of the National Policy for Farmers should be in the area of land reform with particular reference to tenancy laws, distribution of ceiling surplus land, attention to common property and wasteland resources and the consolidation of holdings. Following the conferment of land rights to women under the Hindu Succession Amendment Act (2005), the provision of appropriate support services to women farmers has become urgent. Joint Pattas are essential for women to get access to credit. Also, there should be stringent restrictions on the diversion of prime farmland for non-farm purposes.

2.4.3.2.2 Methods of providing the power of scale to small farmers will have to be developed and popularised on a win-win basis for all concerned. Such methods should include the following:

i. Cooperative Farming – This has by and large not been successful except in the case of the dairy industry. Marketing cooperatives are successful since members cooperate on the basis of enlightened self-interest. Other forms of service cooperatives are yet to emerge on a significant scale. For example there is scope for Irrigation Water Cooperatives which can operate community tubewells, lift irrigation etc. Cooperative farming will be ideal for small and marginal farmers since the cooperative can provide centralised services like tractors and other farm equipment as well as threshing and drying machines, to support small scale decentralised production. This will bring down the cost of production and enhance the quality of produce and thereby of income. Instead of denying small farmers the many opportunities provided by cooperatives, the emphasis should be on the introduction of appropriate reforms to make them small farmer-friendly and efficient. Cooperative credit institutions also need revamping and revitalisation.
ii. Group Farming by Self-Help Groups – So far, Self-Help Groups (SHGs) have been mainly organised for supporting micro-enterprises operated by women with the help of micro-credit. With the growing diminution in the size of operational holdings, it will be useful to promote SHGs at the production end of the farming enterprise involving men. This will be particularly helpful in the case of integrated pest management, integrated nutrient supply, scientific water management and improved post-harvest technology. SHGs will however become sustainable, only if they have backward linkages with technology and credit and forward linkages with processing and marketing organisations. Steps will have to be taken to convert micro-finance into livelihood finance through appropriate support systems. There is also need for establishing **SHG Capacity Building and Mentoring Centres**.

iii. Small Holders’ Estates – In its earlier reports, NCF has recommended the formation of Small Holders’ Cotton, Horticulture, Herbal, Poultry and Aquaculture Estates. The aim is to promote group cooperation among farmers living in a village or watershed or the command area of an irrigation project in improving productivity, reducing the cost of production and entering into marketing contracts with textile mills, food processing industries, pharmaceutical companies, fish marketing agencies etc. Such Small Farmers’ Estates can also manufacture products under brand names and enhance income security. Group insurance will then become feasible. Agri-clinics and Agribusiness Centres could be linked to such Estates.

iv. Contract Farming – Symbiotic contracts which confer benefits to both producers and purchasers will be ideal for ensuring assured and remunerative marketing opportunities. At the moment, the Central and State Governments through organisations like Food Corporation of India (FCI), NAFED, etc., ensure the operation of the Minimum Support Price (MSP) announced by Government. Contract cultivation based on a well-defined Code of Conduct will be helpful to small producers in getting good quality input, a fair price as well as prompt payment for their produce. A **Code of Conduct for Contract Farming** will have to be developed for major groups of farm commodities like vegetables, fruits, flowers, medicinal
plants, tuber crops, pulses, oilseeds, sugarcane, cereals, cotton etc. Both production
and marketing contracts are growing. **Available evidence indicates that direct contract between the producer and purchaser is more advantageous to small farmers than indirect contract through intermediary agencies.** A National Federation of Farmers entering into contract cultivation will be useful to identify the best pro-farmer practices that will ensure a win-win situation for both producers and purchasers.

v. Corporate Farming – The scope for corporate farming is rather limited except in cases relating to the restoration of degraded lands and cultivation of raw material for industries like paper, rayon, furniture, building materials, etc. The corporate sector could bring the best available technology for upgrading degraded lands and for getting high yields through improved technology. The cultivation of crops for biofuels also presents opportunities for corporate farming. However, care has to be taken to ensure that common property resources or grazing lands are not allotted to corporations, thereby leading to a shortage of vital grazing areas for sustainable livestock production.

vi. Company Farming – Private limited companies, registered under the Companies (Amendment) Act, 2002 are now coming into existence in the area of seed production and the production of biofertilisers, biopesticides and other forms of biological software essential for sustainable agriculture. Small farmers can then become shareholders in companies managed by them.

vii. Government State Farms – In the fifties, there was considerable emphasis on the development of large State farms on the model of the farms promoted by the former Soviet Union. Most such farms are now being used for purposes other than the production of food crops. The land available with State Farms could be made available to women self-help groups for the production of hybrid and improved seeds of crop plants, vegetables, fruits and flowers, as recommended by NCF in its First Report. Also, State Farms could be used for developing **Living Heritage Gene Banks** of the Germplasm of local breeds of cattle, sheep, poultry, etc. This will be
very helpful to preserve our animal genetic wealth. Where possible, they should be handed over to farmers’ organisations or NGOs for management. Such farms should be given the responsibility of assisting and encouraging community-based conservation of livestock breeds and species in the surrounding areas. They should be run on scientific lines and monitored by a committee consisting of local farmers’ representatives, scientists and NGOs.

2.4.3.2.3 To sum up, even the ownership of a small plot of land will help the family to improve household income and nutrition security. Wherever feasible, landless labour households should be provided with at least 10 cents per household which will give them space for kitchen gardens and animal rearing.

2.4.3.3 Livestock

2.4.3.3.1 According to the 17th Livestock Census released in January 2005, India has 57 per cent of the world’s buffalo population and 16 per cent of the cattle population. Also, we rank third in sheep wealth and second in goat population. The contribution of the livestock sector to agricultural GDP has increased from 18 per cent in 1981 to 26 per cent in 2004-05. It is clear that livestock and livelihoods are very intimately related in our country and that crop-livestock integrated farming is the pathway for farmers’ well being.

2.4.3.3.2 The ownership of livestock is much more egalitarian since resource poor farming families own a majority of cattle, buffalo, sheep and goats. The major constraints experienced by such families relate to fodder, feed and healthcare. There is an urgent need for establishing Livestock Feed and Fodder Corporations to assist SHGs to produce good quality animal feeds. Such a Corporation should be a facilitating body for providing seeds and planting material of improved varieties to SHGs for local level production. The productivity of our livestock is low and can be easily improved through better nutrition and healthcare. Agri-clinics operated by veterinary and farm science graduates will be very helpful to enhance the income of livestock owners through higher productivity. At the same time, crop-livestock mixed farming systems should be promoted since this will help to improve both income and household nutritional security.
2.4.3.3 The Union Finance Minister in the recent budget has announced that banks are being asked to provide a separate window for SHGs as well as for joint liability groups of tenant farmers. This window will provide an opportunity for achieving a fodder and feed revolution for enhancing the health and productivity of our unique livestock wealth. Livestock insurance also needs revamping and be made accessible to small livestock owners. Livestock rearing can be linked to organic farming, so that there is value addition to the produce from small farms.

2.4.3.4 Fisheries

2.4.3.4.1 Both coastal and inland fisheries provide employment and livelihoods to millions of families. There is considerable scope for improving the income of fisher families on an environmentally sustainable basis by introducing Integrated Coastal Zone Management and scientific fish rearing, harvesting and processing. In the area of public policy, there is need for well-planned Aquarian Reforms addressing the following issues:

- Conflicts between mechanised and artesenal fishing enterprises.
- Conflicts between aquaculturists and agriculturists as well as local population because of salt water entering into the aquifer, and pollution caused by intensive systems of aquaculture.
- Lack of well-defined policies for the allocation of ponds and reservoirs to landless labour and dalit families for practicing modern aquaculture based on composite fish farming.
- Concerns of environmentalists in the areas of seaweed farming and introduction of exotic carps and other alien invasive species.
2.4.3.4.2 Therefore, aquarian reforms should address issues in the areas of ecology and equity and should enable resource poor fisher and landless labour families to earn their livelihood from capture and culture fisheries in a sustainable manner. The other aspects of policy which need attention are fish seed and feed production, post-harvest technology and subsistence allowance for fisher families during the ‘close season’ period. The subsistence allowance per fisher family should be at least Rs.1500 per month during the ‘close season’. The establishment of a National Fisheries Development Board (NFDB) on the lines of the National Dairy Development Board is a welcome step. The guiding principles for NFDB should be ecology, economics, gender equity and employment generation. Such a Board should have representatives of fisher communities representing both the capture and culture aspects of fish farming. Also, the Board should establish “Fish for All Training and Capacity Building Centres” which can impart training to fisher families in all aspects of the capture/culture–consumption chain. Quality literacy is important to safeguard the harvested fish from salmonella and other infections capable of producing mycotoxins. Another area requiring attention is the standardisation of Low External Input Sustainable Aquaculture Techniques (LEISA) which will be environment friendly. The National Fisheries Development Board should also help those engaged in small scale ocean fisheries by providing Mother Ships which can ensure hygienic handling of catch in the mid-ocean. Other forms of centralised services to support the decentralised capture and culture fisheries sectors are also important. Special attention needs to be given to the training needs of fisher women who handle the harvested catch. The National Aquaculture Authority and the National Fisheries Development Board should work together, so that capture fisheries and aquaculture become mutually reinforcing in improving the economic well being of fisher families and the nutritional well-being of consumers.

2.4.3.4.3 Inland aquaculture including ornamental fish culture and air breathing fishes can provide additional income to resource poor families. This is why well-defined aquarian reforms are essential to provide fisher families, particularly women, with the necessary space in ponds and reservoirs. There are also opportunities for establishing artificial coral reefs to compensate for the loss of natural coral reefs. This will help to
revive the fish catch. The new Integrated Coastal Zone Management Policy should pay concurrent attention to the management of about 10 km of land surface and 10 km of sea surface from the shoreline. This will ensure that land-based occupations do not cause damage to ocean fisheries as a result of release of effluents and other pollutants. The coastal communities can also be enabled to raise bioshields comprising mangroves, casuarina, salicornia, atriplex and other halophytic plants. This will help to safeguard the lives and livelihoods of coastal fisher and farm families in the event of cyclonic storms and seawater inundation, as for example like the one caused by tsunami. Coastal Bioshields, Biovillages and Village Knowledge Centres would help all families living in coastal areas to earn sustainable and secure incomes.

2.4.3.4.4 There is also need for a dynamic policy for the management and economic use of the Exclusive Economics Zone (EEZ) extending to nearly 2 million km$^2$ of sea surface, which amounts to two-thirds of the land surface available to India. This can be a priority task of the National Fisheries Development Board since it can help to generate both new income and employment opportunities for coastal communities.

2.4.3.5 Water

2.4.3.5.1 Irrigation water at the right time and in adequate quantities is now becoming a serious constraint in achieving both higher productivity and stability of farming in many parts of the country. Jal Swaraj or self-sufficiency in irrigation water availability is the need of the hour. Though the total rainfall in our country is satisfactory, its distribution is highly skewed, with most of the rainfall occurring in 100 hours in a year. Therefore, rainwater harvesting and aquifer recharge have become essential for ensuring the stability of supply. They must be made mandatory. Water quality also needs attention since water often gets polluted at source with pesticide residues and toxic chemicals. There is also the problem of arsenic poisoning in groundwater. The problem of arsenic poisoning abounds because people residing in regions blessed with abundant surface water such as West Bengal increasingly depend on the groundwater for drinking and irrigation purposes. There is an urgent need to remove this dependency by making available other safe drinking water options—for instance, surface water, which is arsenic free. West
Bengal has 7000 cubic meter of available surface water per capita. Effective management of surface water including rivers, canals, water bodies, lakes, ponds and rainwater can reduce groundwater dependency in irrigation.

2.4.3.5.2 Besides problems relating to adequacy and quality, there are serious issues concerning equity in water distribution. Water is a public good and a social resource and not private property. The privatisation of water supply distribution is fraught with dangers and could lead to water wars in local communities. A nationally debated and accepted strategy for bringing 10 million hectares of new area under irrigation under the Bharat Nirman programme should be developed. The Polavaram Project to be built across the Godavari in Andhra Pradesh is a case in point. Different viewpoints can be reconciled only by dialogue and consensus building; Taking Prior Informed Consent of the community that will be affected by a project should be a precondition for approval of a project.

2.4.3.5.3 Further, increasing supply through rainwater harvesting and recharge of the aquifer should become mandatory. All existing wells and ponds should be renovated. Demand management through improved irrigation practices, including sprinkler and drip irrigation, should receive priority attention. A Water Literacy movement should be launched and regulations should be developed for the sustainable use of groundwater. Seawater farming should be promoted in coastal areas through the cultivation of mangroves, salicornia, casuarina and appropriate halophytic plants. The conjunctive use of rain, river, ground, sea, and treated sewage water should become the principal method for the effective use of available water resources. In water scarce areas, the land use system should place emphasis on the cultivation of high value–low water requiring crops, such as pulses and oilseeds. Pulses and oilseed villages can be promoted where all farmers work together in harvesting rainwater and sharing the water equitably for growing pulses and oilseeds. There is need for a Pani Panchayat in every village consisting of the Members of the Gram Sabha who could help in getting the available water distributed on an equitable basis. Where large scale dislocation of families living in the areas which will be submerged as a result of the construction of large dams or linking of rivers is likely, the Gram Sabhas of the affected villages should be
involved in the preparation of the rehabilitation plans. This should be done at the
time the large dam or other steps like the interlinking of rivers are in the drawing board.
Proactive consultations and consensus building will help to save both avoidable human
hardship and suffering and protracted litigation. Appropriate legislation should also be in
place to prevent further exploitation of groundwater in Dark Blocks by individual
farmers. Farmers also need technical advice in the selection of sites for borewells. A
farmer-friendly insurance cover should be in place for failed wells.

2.4.3.5.4 Land use decisions are also water use decisions. Hence, in areas characterised
by water scarcity, the cropping pattern should be designed in such a manner that low
water requiring, but high value crops like pulses are grown. Water Users’ Associations
are now being encouraged for maximising the benefits of the available water. The
National Rainfed Area Authority could help in promoting scientific water harvesting,
sustainable and equitable use and the introduction of efficient methods of water use like
drip irrigation. There should be symbiotic interaction between the National Rainfed Area
Authority, the National Horticulture Mission, the Technology Missions and the National
Rural Employment Guarantee Programme.

2.4.3.5.5 There are many schemes currently in progress with support from the Central
and State Governments to harness the following sources of water for agricultural,
industrial and domestic purposes.

- groundwater;
- rainwater;
- surface water including rivers and reservoirs;
- recycled water by treating effluents and sewage water; and
- sea water.

2.4.3.5.6 All the above sources of water can be utilised both in a conjunctive manner
and separately using the most efficient technologies available. For example, all along the
coast as well as in the Andaman and Nicobar Islands and Lakshadweep Group of Islands,
seawater farming could be promoted for coastal area prosperity. This will involve the
introduction of agro-forestry systems which combine the cultivation of mangroves, salicornia, casuarinas, coconut, cashewnut etc. along with prawn culture. Such agro-aqua farming systems will open up great opportunities for income and employment generation in coastal areas on a sustainable basis, provided they are based on sound ecological principles.

2.4.4 Biodiversity

2.4.4.1 The Government of India has already enacted a Plant Variety Protection and Farmers’ Rights Act (PVPFR), 2001 and Biodiversity Act, 2002. The implementation of both these Acts has also begun. The PVPFR Act recognises the multiple roles of farmers as cultivators, conservers and breeders. Detailed guidelines should be developed for ensuring that the rights of farmers in their various roles are protected. For example, most farmers who are cultivators are entitled to Plant Back Rights. This implies that they can keep their own seeds and also enter into limited exchange in their vicinity. Farmers as breeders have the same rights as professional breeders and they can enter their varieties for registration and protection. Farmers as conservers are entitled to recognition and reward from both the National Gene Fund and the National Biodiversity Fund. Quite often, the conserved material of great value could have been the contribution of a community and not an individual. Therefore, the procedures adopted should be such that community contributions can be recognised and suitably rewarded. Breeders should be required to indicate in the pedigree of the variety for which they are seeking protection, the names of the landraces and the areas from where they were collected, while submitting their application for registration. For example, Oryza nivara from Eastern UP was the major donor of tungro virus resistance in improved rice varieties like IR 36 which occupied over 10 million hectares in South and South East Asian countries.

2.4.4.2 The provisions in the Biodiversity Act, for prior informed consent and benefit sharing, are equally important for tribal and rural women and men. Invariably much of the conservation work has been done by women. Therefore, the recognition procedures should take into account gender roles in the conservation and enhancement of bioresources.
2.4.4.3 There is also need for assisting tribal and rural women and men in revitalising their in situ on-farm conservation traditions. Participatory breeding procedures, involving scientists and local conservers, would be particularly helpful in improving the productivity of landraces. Genetic engineers, working in public-good institutions should perform the role of pre-breeding, i.e., development of novel genetic combinations for important economic traits, such as resistance to biotic and abiotic stresses. They should then work with farmers in participatory breeding programmes, so that genetic efficiency and genetic diversity can be integrated in an effective manner. Genetic homogeneity enhances genetic vulnerability to pests and diseases. This is why the integration of pre-breeding and participatory breeding would help to insulate small farmers from the risks of pest epidemic.

2.4.4.4 There is also need for launching genetic and legal literacy movements in areas rich in agro biodiversity, such as the North East Region, Western and Eastern Ghats and the arid zone. Genome Clubs can be organised in rural schools for imparting an understanding of the importance of genetic resources conservation. Legal literacy would help tribal and rural families to understand the provisions in PVPFR and Biodiversity Acts with reference to their entitlements. If such steps are taken, we can prevent some of our genetic paradises becoming ‘hotspots’ from the point of view of threat to biodiversity. Farm and tribal families should be trained in methods of preventing gene erosion. Coastal biodiversity, including coral reefs and sea grass beds, are also in urgent need of conservation. Tribal, farm and fisher families can play a major role in this area provided they are involved as partners in the genetic conservation movement. Traditional methods of conservation like Sacred Groves need to be supported and encouraged.

2.4.4.5 Animal Genetic Resources

2.4.4.5.1 Apart from conserving genetic diversity and acknowledging the vital role of livestock keepers, there is need to document the indigenous knowledge of pastoral communities about animal maintenance and breeding. Community-based conservation and development of indigenous livestock breeds and species should be encouraged. There should be a special focus on both hot and cold arid and semi-arid areas where the genetic
diversity and associated indigenous knowledge are particularly well developed. Wastelands could be used to promote in situ conservation of animal breeds, even those that are amenable to ex situ conservation. A policy focus will need to be created, to conserve grazing lands, to enable the conservation of animal genetic resources. Documentation of special traits should be done in the context of the new biology and new nutritional needs or for other economic traits like hide/leather quality. There is need for offshore Genetic Resource Centres for screening germplasm for resistance to serious diseases like the H5N1 strain of avian influenza virus.

2.4.4.5.2 The burden of conservation cannot be allowed to fall on the largely impoverished communities that maintain animal genetic diversity. A system of rewards and incentives must be developed to enable and motivate people to conserve their breeds under the Biodiversity Act. The Biodiversity Fund should be used for such purposes. Livestock keepers’ inherent rights to continue to use and develop their own breeding stock and breeding practices should be acknowledged. The government must recognise these rights, acknowledge livestock keepers’ contribution to the national economy, and adapt its policies and legal frameworks accordingly. This is particularly important to pre-empt attempts to use the intellectual property system to obtain control over animal resources that are an important component of the country’s food and livelihood security systems.

2.4.4.6 Plant Genetic Resources

2.4.4.6.1 A nationwide programme needs to be launched for the ex situ and in situ conservation of plant genetic resources at the field/farmer level. Farmer level gene/seed banks need to be put up in areas where traditional varieties are saved. Some State governments, as for example Jharkhand is promoting a ‘Seed Exchange Programme’ under which farmers are given hybrid rice in exchange for their traditional rice varieties. There is need to ensure that in this process, the traditional rice gene pool is not lost. Participatory management of National Parks, Biosphere Reserves and Gene Sanctuaries should be promoted.
2.4.5 Climate Change

2.4.5.1 Climate change leading to adverse changes in temperature, precipitation and sea level is no longer just a theoretical possibility. Most experts agree that we are already beginning to experience the impact of global warming as evident from the melting of glaciers and Antarctic and Arctic ice caps. Coastal storms and cyclones are also increasing in frequency and intensity. Droughts and floods are likely to be more frequent. Although climate change is a product of the unsustainable consumption of non-renewable forms of energy by industrialised countries, the harmful impact of climate change will be felt more by poor nations and the poor in all nations due to their limited coping capacity. Steps will have to be taken to standardise proactive measures that can reduce the vulnerability to climate change. Based on computer simulation models, contingency plans and alternative land and water use strategies will have to be developed for each major agro-climatic zone. Protecting the livelihood security of farm and fisher women and men from adverse climatic changes has to become a priority task. In drought and flood prone areas, experienced farm women and men can be trained as ‘Climate Managers’.

2.4.6 Science and Technology

2.4.6.1 Science and Technology are the drivers of change in farm operations and output. New technologies which can help to enhance productivity per units of land and water are needed for overcoming the prevailing technology fatigue. Frontier technologies like biotechnology, information and communication technology, renewable energy technologies, space applications and nanotechnology provide uncommon opportunities for launching an ever-green revolution, capable of improving productivity in perpetuity without ecological harm. In order to ensure social inclusion in access to new technologies, public investment in socially relevant agricultural research should be stepped up under the umbrella of the National Agricultural Research System (NARS) which comprises large numbers of ICAR institutions, State Agricultural Universities, All India Coordinated Research Projects and National Bureaus. NGOs carrying out research should also be encompassed under the NARS umbrella.
2.4.6.2 The research strategy should be pro-nature and pro-small farmer oriented. For example, in the case of Bt Cotton, public good institutions should concentrate on developing varieties rather than hybrids, so that farmers can keep their own seeds. Even now 80 per cent of the seeds used in agriculture come from farmer-seed systems. These will have to be strengthened and supported through infrastructure for community managed Seed Villages and Seed Technology Training Centres. In order to spread scientific literacy and to remove inadequately informed apprehensions about the risks and benefits associated with biotechnology and other new technologies, at least one woman and one male member of every Panchayat should be trained as Farm Science Managers.

2.4.6.3 Among the other steps, which need urgent implementation are the addition of post-harvest technology wings to Krishi Vigyan Kendras, and the organisation of lab-to-land demonstrations in the area of post-harvest technology, agro-processing and value addition to primary products. This will be important for providing skilled jobs in villages to landless labour families. Also, there is need for establishing Farm Schools in the fields of outstanding farmers like Krishi and Udyan Pandits and awardees of nationally recognised awards for farmers like the Karshakhashree of Malayala Manorama and ASPEE Awards. Farmer-to-farmer learning can speed up the process of technological upgrading of crop and animal husbandry, fisheries and agro-forestry. Priority could also be given for the establishment of Farm Schools in the fields of eminent horticulturists including those, who are raising organic vegetables and fruits and tissue culture propagated planting material. Human resource development holds the key to breaking the stagnation in agricultural growth and productivity.

2.4.6.4 Organic farming requires greater scientific inputs than chemical farming. This area of research hence needs high level multidisciplinary attention. Certification procedures which are internationally recognised are also needed. Organic farming zones could be created in medicinal plants and other crops which are likely to be in demand in national and international markets. Science for the small farmers should be the motto since whatever new technologies are adopted by resource poor farmers will easily spread among large farmers. The reverse may not happen.
2.4.6.5 In intensive agriculture areas like the Punjab and Haryana, crop diversification may be beneficial from the point of view of ecology, economics and employment generation. **However, any advice on crop diversification must be accompanied by steps to ensure effective market support for the alternative crops.**

2.4.6.6 Agriculture is becoming knowledge intensive. Knowledge is often a substitute for land and water, since it helps farmers to produce more from the same plot of land and same quantity of water. This is why computer-aided and internet connected Village Knowledge Centres assume great importance in the movement for a technological upgradation of both farm operations and farming efficiency.

2.4.6.7 **IPR policies should make provision for compulsory licensing of rights in the cases of research products and processes of value to resource poor farming families. In all cases of health and food security, social inclusion should be the guiding factor in the development of IPR.**

2.4.6.8 **Agro-meteorology**

2.4.6.8.1 The national capacity in short-, medium- and long-term weather forecasting is quite considerable. What is now important is to convert generic information into location-specific land use advice, based on cropping patterns and water availability. The Agrometeorological Advisories issued by Indian Agromet Advisory Service Centre, Pune, can be used by **Panchayat Level Farm Science Managers**, trained to give appropriate land use suggestions. Also, the **National Land Use Advisory Service**, recommended by NCF in its Third Report, would help to make the information relevant to both farm and fisher families. In the case of marine fisheries, data on wave heights and location of fish shoals are now available. These will have to be transmitted to the fishermen before they move into the sea. An integrated internet – FM or HAM radio service would be very helpful to fishermen on the high seas.

2.4.6.8.2 Timely and dependable advice on weather conditions will be very helpful to farm families to plan their sowing and the other operations. The National Land Use Advisory Service in collaboration with Panchayat Level Farm Science Managers can help
to bring the benefits of the advances in agricultural meteorology to farm and fisher populations.

2.4.6.9  Agricultural Biosecurity

2.4.6.9.1  Agricultural Biosecurity covering crops, trees and farm and aquatic animals is of great importance since it relates to the work and income security of 70 per cent of the population, and food and trade security of the nation. There is need to develop a National Agricultural Biosecurity System (NABS) with the following aims:

- Safeguard the income and livelihood security of farm and fisher families as well as the food, health and trade security of the nation through effective and integrated surveillance, vigilance, prevention and control mechanisms designed to protect the productivity and safety of crops, farm animals, fishes and forest trees.

- Enhance national and local level capacity in initiating proactive measures in the areas of monitoring, early warning, education, research, control and international cooperation, and introduce an integrated biosecurity package comprising regulatory measures, education and social mobilisation.

- Organise a coordinated National Agricultural Biosecurity Programme on a hub and spokes model with effective home and regional quarantine facilities capable of insulating the major agro-ecological and farming systems zones of the country from invasive alien species of pests, pathogens and weeds.

2.4.6.9.2  The NABS should have the following three mutually reinforcing components:

i. National Agricultural Biosecurity Council (NABC) chaired by the Union Minister for Agriculture to serve as an apex policymaking and coordinating body.

ii. National Centre for Agricultural Biosecurity (NCAB) having four wings dealing with crops, farm animals, living aquatic resources and agriculturally important micro-organisms and dealing with the analysis, aversion and management of risks, as well as the operation of an early warning system. NCAB will provide the Secretariat for the National Agricultural Biosecurity Council.
iii. **National Agricultural Biosecurity Network (NABN):** NCAB will serve as the coordinating and facilitating centre for a National Agricultural Biosecurity Network designed to facilitate scientific partnerships among the many existing institutions in the public, private, academic and civil society sectors, engaged in biomonitoring, biosafety, quarantine, and other biosecurity programmes to help maximise the benefits from the already existing scientific expertise and institutional strengths.

2.4.6.9.3 The establishment of a National Biosecurity Council, National Centre for Agricultural Biosecurity and a National Agricultural Biosecurity Network will help us to strengthen considerably our ability to undertake pro-active measures to prevent the outbreak of pandemics and the introduction of invasive alien species. Such an Agricultural Biosecurity Compact is an urgent national need since prevention is always better than cure. The details on the structure and organization appear in chapter IV of this Report.

2.4.7 **Inputs**

i. **Seeds:** Good quality seeds and disease free planting material are essential for crop productivity and security. Hybrids are now becoming available in many crops. Seeds of such hybrids can be produced by women SHGs on contract with seed companies. Mutually beneficial farmer-seed company partnership can be fostered. In the case of new varieties, foundation seeds could be provided to SHGs. Proper technical guidance and training in seed technology will be necessary for SHGs to produce high quality seeds. This will be an ideal area for private sector–farmers’ association partnership.

ii. **Soil Health:** Pricing policies should be such that balanced fertilisation is promoted. As recommended in the First Report of NCF, every farm family should be issued with a Soil Health Passbook, which contains integrated information on the physics, chemistry and microbiology of the soils. In particular, more laboratories to detect micronutrient deficiencies are urgently needed. **Soil Health Enhancement holds**
the key to raising small farm productivity. There is also need for proper technical advice on the reclamation of wastelands and on improving their biological potential.

iii. Implements: Small farmers need implements which can enable them to sow the crop at the right time and manage weeds and adopt improved post-harvest technology. Women need implements which can reduce drudgery and enhance output.

iv. Vaccines and Sero-diagnostics: Major gaps in the facilities presently available will have to be filled in the case of important animal diseases. Biotechnology research in the area of vaccine development needs to be stepped up. Public-private partnerships should be encouraged in this area.

v. Fish Seed and Feed: Good quality and disease free fish seed holds the key to successful inland aquaculture. Suitable SHGs could be trained in induced breeding and fish seed production. Similarly, feed at affordable prices is another requirement. Fish farmers’ cooperatives could organise the production of feed and seed with technical assistance from the National Fisheries Development Board.

vi. Animal Feed: Inadequate nutrition is the primary cause of low milk yield in dairy animals. There is both under nutrition and malnutrition. Annual milk production can reach over hundred million tonnes if the nutritional requirements of cows and buffaloes can be met. Here, both conventional and non-conventional approaches are needed. Many of the celluleosic wastes can be converted into good animal feed through appropriate treatment and enrichment. Breeding of nutrition rich fodder plants should receive high priority. Established technologies such as baling and ensiling, need to be disseminated widely.

vii. Support Services: A few other essential support services needed for higher farm animal productivity are-establishing genetic evaluation systems for indigenous breeds as well as crosses so that selection can lead to genetic improvement of
production characteristics upgrading of breed through artificial insemination, cross breeding suited to the farmers’ resources and improved processing and marketing.

viii. There are other areas of input supply also which merit intensive attention. Some examples: bio-fertilisers and bio-pesticides, irrigation equipment, assured power supply, postharvest technology and infrastructure and rural godowns and warehouses.

2.4.8 Farmer Categories needing Special Attention

2.4.8.1 Landless Agricultural Labour

2.4.8.1.1 Agriculture accounted for 21 per cent of GDP in 2004-05. Employment in the farm sector however amounted to as much as 60 per cent in 1999-2000. This represents a decline of just 16 per cent since 1950-55. Parts of the non-agricultural economy are on a roll, while the agricultural economy is in a state of distress. Those most affected by the agrarian crisis are the ones without assets, particularly women. Men often migrate to towns and cities in search of jobs. The National Rural Employment Guarantee Programme should help to save the assetless poor from starvation. However, it cannot lift them out of poverty.

2.4.8.1.2 China has addressed the need for creating opportunities for skilled non-farm employment through a massive Township and Village Enterprises (TVE) movement. There were 21.15 million TVEs in China at the end of 2001, employing a total of 130 million workers. Their added value of 29356 billion Yuan (3669.5 billion US $) accounting for 31.1 per cent of the national total (He Kang, 2006, China’s Township and Village Enterprises, Foreign Language Press, Beijing)

2.4.8.1.3 Several programmes have been initiated by KVIC and NGOs for generating off- and non-farm employment. The SHG movement is helping women, particularly in South India to come out of the poverty trap. There is need for a counterpart to NREGP in the skilled employment sector. Initiatives like Small Farmers’ Agribusiness Consortium (SFAC), Agri-clinics and Agribusiness Centres, Food Parks etc., which could have provided substantial additional livelihood opportunities to the rural poor are yet to take
off. It would be useful to integrate all of them into one initiative like China’s TVEs and launch a Rural Non-farm Livelihood Initiative for families without land or other productive assets. The joyful learning programme through computer aided adult/functional literacy procedures should help to accelerate the progress of eradication of illiteracy. The Rural Non-farm Livelihood Initiative could have as its core the KVIC and restructured SFAC and bring all rural non-farm employment programmes together, in order to generate convergence and synergy among them. A Consortium approach could be adopted involving Central and State Governments, Academia, NGOs, public and private sector industry and financial institutions. The sooner we initiate a massive and market-driven rural non-farm livelihood programme, the greater will be the prospect for peace and security in rural India. Also, food security in India is best expressed in terms of million person years of jobs, rather than in million tonnes of foodgrains. Where there is work, there is money. Where there is money, there is food. There is therefore need for a restructuring and revamping of organisations like SFAC, KVIC, Agri-clinics and Agribusiness Centres.

2.4.8.2 Women Farmers and Farm Labour

2.4.8.2.1 Public policies in the field of agriculture are yet to be engendered. Women-headed farm households suffer many handicaps in the areas of access to technologies, inputs and extension advice. Absence of titles to land prevents many de-facto women farmers from eligibility to institutional credit. Kisan Credit Cards have been issued mostly to men. Small farm productivity will not go up unless there are serious efforts in the areas of knowledge and skill empowerment of women in all aspects of the farming system. Considering the critical role played by women in post-harvest handling, processing, storage and marketing, women farmers and farm labour should be actively involved in the 60,000 Lab-to-Land post-harvest technology and agro-processing demonstrations recommended by NCF in its Third Report.

2.4.8.2.2 Joint Pattas should be issued speedily, particularly in the areas where there is outmigration of men. Also, women farm workers require support services like crèches, healthcare and functional literacy courses. Nutritional requirements of pregnant and
nursing women need to be met. Women SHGs need Capacity Building and Mentoring Centres. They should also be given land in State Farms for seed production, animal genetic resources conservation, etc. Women perform multiple functions. The aim of agricultural research and extension should be bringing about a reduction in the number of hours of work and an increase in the income per each hour of work, i.e. value-addition to the time and labour of women in agriculture. Training in food safety and quality management is essential, since women handle many of the post-harvest operations. Legal literacy with reference to their entitlements is equally important.

2.4.8.2.3 Credit continues to be a big problem for women farmers and even more so for women tribal farmers. Even though the criteria have been made flexible to include tenant farmers, ownership of land pattas is still the norm for extending credit. This implies a problem for women farmers (who are generally not title-holders), and also small and marginal farmers, who may be cultivating more land than that for which they have pattas. **Institutional credit for agriculture needs to be delinked from land titles.**

2.4.8.2.4 Women are not allowed to participate in the traditional decision-making bodies. This is a major constraint and leaves them out of decision-making and planning processes, as say in the case of NREGP. The majority of representatives of the farmers’ union at the district level are men. The voices of women are not heard in such consultation bodies.

2.4.8.2.5 Without conscious effort to change this state of affairs and promotion of womens’ skill and technological empowerment, the productivity of small farms will remain low and post harvest losses will remain high.

**2.4.8.3 Tribal Farmers**

2.4.8.3.1 Scheduled Tribes account for 8.6 per cent of the total population of the country. A majority of tribal communities across the country are dependent on forests for their livelihoods. These include cultivation (shifting cultivation in many parts of East and North East India), collection of fuel, fodder and a range of non-timber forest produce.
Tribal farmers are among the poorest within the category of farmers. These communities have customary norms for ownership of the forest areas, and also have community based mechanisms for protection and rejuvenation. Since the colonial period and even in the subsequent years of independence, several policies have been enacted related to forests and rights of forest dwelling communities (mostly tribals).

2.4.8.3.2 At the same time, protection and conservation of forests areas, has been under the control and administration of the State Forest Departments. There has been no systematic effort to demarcate areas that are used and managed by forest dwelling communities, or to provide legal rights and titles to these communities. The relation between the Forest Department and forest dwelling communities has largely been one of conflict and confrontation, with forest dependant communities being labeled ‘encroachers’. Forest communities are often forced to eke out their livelihoods through a pattern of bribes and fines. Attempts towards Joint Forest Management have been successful in some States. These however are dispersed and have also not been gender sensitive.

2.4.8.3.3 Historically, large development projects including dams and mines have also encroached upon large tracts of forest areas, and displaced several thousand forest dwelling communities, who are still struggling to survive in the absence of human-centred rehabilitation efforts. In most instances, in the absence of land titles, their very existence is not acknowledged. According to the Ministry of Environment and Forests, close to 10 lakh hectares of forestland have been released for various projects such as mining and industrial development. This area is almost as large as the same Ministry’s estimate of the total forestland area under ‘encroachment’ (13.4 lakh hectares).

2.4.8.3.4 Efforts to manage forest areas in the country will have to balance the demands for ecological conservation as well as protecting the livelihoods of forest dwelling communities. The following steps will be helpful in this respect:
i. A clear statement of rights relating to what has traditionally been the domain of forest dwellers (both tribal and non-tribal) including lands traditionally occupied and resources traditionally used.

ii. A clear process by which legitimate right-holders can be identified and recorded, and conversely, by which recent encroachers, and others who have been taking advantage of forest dwellers for vested interest, can be identified and alienated.

iii. Explicit provisions to ensure conservation, including priority to provisions of wildlife/biodiversity/forest laws that are meant to ensure conservation, and special focus on protected areas and threatened species.

iv. Strengthening of or changes in institutional structures that would enable more participatory processes of decision-making, including in the management of protected areas.

v. Explicit provisions that enable forest-dwelling communities to say ‘no’ to, or seek changes in, ‘development’ projects that are impinging on their lands and resources.

vi. Provisions for regular and open processes of dialogue, consultation, sharing of information, etc, involving communities, NGOs, officials, and others.

vii. Clear monitoring provisions that enable a constant check on whether the rights are being honoured or not, as also whether the exercise of rights is respecting conservation parameters.

2.4.8.3.5 An important area of conflict between people and protected areas is the problem of compensation for damage caused to livestock, crop or life by animals. States must review the provisions and procedures for compensation for human life, livestock and crop damage. Compensation must be paid to families who continue to live within the reserves also. The joint forest management programme in the vicinity of the reserves must be revamped so that people living in the fringes can be given management decisions
and rights over the produce of forests; this will help to enhance the productivity of the resources as well.

2.4.8.3.6 Some of the generic problems of tribal farm families, also applicable in general terms for small and marginal farmers and women farmers across the board are the following:

i. Lack of inputs especially quality seeds and fertilisers.
ii. No mechanism for State purchase of output at Minimum Support Price.
iii. Lack of attention to soil and water conservation that could facilitate double cropping.
iv. Total lack of attention to livestock management especially fodder production. Free grazing of cattle during the rabi season is a major bottleneck for the taking of a second crop.
v. Vesting of land in the community, absence of alienable rights with the farmers and the problems in creation of charge/mortgage on land in certain tribal areas constrain flow of institutional credit. The need is to develop innovative methods of collateral substitution and documentation procedures to overcome the difficulties.
vi. Integrated farming projects based on plantations and inter-cropping (as granted under the Meso-area development programmes, or ITDP) again need to be delinked from land titles. At present, to gain sanction, a scheme of this nature requires the farmers to agree to provide at least 5 acres of land. In a hilly terrain and with continuous subdivision of plots over generations, this not only becomes difficult even for male farmers, but more so for women who lack titles. Yet, trees in particular are seen as women’s resource, with the output used both for family nutrition and sale.

vii. While KVKs and ATMA are now providing more of agriculture and resource-related training, the old home science model continues for women. Training for tribal women SHG group members is provided in candle-making, tomato sauce making and making bead necklaces—obviously a total waste of time and resources, unless market tie-ups for such products exist.
2.4.8.4 Pastoralists

The Draft Scheduled Tribes (Recognition of Forest Rights) Bill, 2005 envisages, “rights of uses or entitlements such as grazing in forests and traditional seasonal resource access of nomadic or pastoralist communities”. This Act is yet to be passed by Parliament. Many of the Joint Forest Management Committees are designed to provide opportunities to tribal families and pastoralists for access to non-timber forest products. The following steps are needed to ensure the right to livelihood of pastoralists:

i. Restoration of traditional grazing rights and camping rights in forest areas including wildlife sanctuaries and national parks, and also those areas earmarked for grazing purpose in village common lands.

ii. Formalising entitlements (including issue of permanent grazing cards) for the traditional pastoralists/herders maintaining native animal breeds and who depend upon them for their livelihood for enabling their free access to notified or demarcated grazing sites and migration routes.

iii. Whenever a tree planting programme is to be implemented, alternative grazing land and drinking water resources for animals should be allotted by the concerned authorities. It should be made mandatory for the implementing agency before initiating afforestation, to seek prior consent from forest dependent communities including pastoralists. Rotational system of grazing should be encouraged instead of complete closing of forest zone for tree plantation purpose.

iv. In-depth documentation, characterisation of indigenous livestock breeds should be carried out to recognise and protect intellectual property rights of the local communities / individuals, conserving these livestock breeds.

v. Pastoralists should be involved in all local natural resource management programmes, including village forest committees.
vi. Common land assigned to forest departments and unutilised or encroached land should be retrieved and brought under the control of village level committees or grassroots institutions for pasture development.

2.4.8.5 Plantation Labour

2.4.8.5.1 A large number of small farmers are engaged in the cultivation of plantation crops like tea, coffee, rubber, cardamom, pepper and vanilla. Price fluctuation and competition from products imported from abroad are among the major problems facing them. A Price Stabilisation Fund is essential to insulate them from the vagaries of the market. Similarly, plantation labour, many of whom are women, require support services like crèches and health and life insurance. The problems of plantation labour therefore need special attention.

2.4.8.6 Island Farmers

2.4.8.6.1 The farming and fisher families in Andaman and Nicobar Islands and the Lakshadweep group of Islands need special attention. Their needs cover the areas of technology, training, techno-infrastructure and trade. Island agriculture also has the problem of transport costs, particularly for commodities like fish which may have to be sold in the main land. There are several ancient tribes in the Andaman and Nicobar Islands who have rich traditional knowledge and wisdom. Steps should be taken to recognise and reward their indigenous knowledge in the areas of biodiversity conservation and traditional healthcare. The islands are also ideal for horticulture including coconut plantation. There are also special health problems. Therefore both the National Horticulture Mission and National Rural Health Mission should pay particular attention to the needs of Island farmers and fishermen. Proactive measures like the erection of mangrove and non-mangrove based bioshields should be initiated in order to safeguard the lives and livelihoods of island populations in the event of sea level rise due to global warming.
2.4.8.7  Urban Farmers

2.4.8.7.1  Urban home gardens could make a substantial contribution to improving nutrition security through the cultivation and consumption of vegetables and fruits. Home nutrition gardens could be designed in the case of low-income groups in such a manner that they can provide horticultural remedies to major nutritional maladies like deficiency of micronutrients in the diet. Urban backyard farming will require support services in the form of good seeds and planting material and safe plant protection techniques. Urban slums need particular attention from the point of view of combating malnutrition through nutrition gardens. The National Horticulture Mission could pay particular attention to enhancing the nutrition security of urban slum dwellers and low income groups through promoting the cultivation and consumption of appropriate vegetables and fruits.

2.4.8.8  Organic Farmers

2.4.8.8.1  The challenge to organic farmers lies in raising the organic carbon content in the soil to 1 per cent and total organic matter to about 10 per cent. The approximate cost of converting one hectare of wasteland to organic farming will be about Rs.30,000 per annum. Such expenditure will be needed for about three years, so that the soil fertility can be enhanced to sustain good yield. The organic farming movement in India suffers from a lack of institutional support in the areas of research, extension and marketing. Farmers feel the need for technological guidance, but research work based on careful field experiments is currently inadequate. Organic farming requires more scientific support than chemical farming. The Krishi Vigyan Kendras should be equipped to provide training in organic agriculture. Assured and remunerative marketing opportunities are yet to develop. Internationally accepted certification procedures also need strengthening. Organic farming zones could be identified, like some of the hill areas and islands where currently chemical fertiliser use is very low. A National Federation of Organic Farmers’ Association could be formed to develop common brand names both for the home and external markets. Food safety and quality specifications should conform to the codex alimentarius standards, since there are
occasional reports of heavy metals being present in organic foods. Certification procedures should be made farmer-friendly and affordable. When subsidies or loans are given to farmers to buy fertilisers, there should be no insistence on the purchase of only chemical fertilisers. Farmers should be able to spend the money on organic fertilisers and bio-pesticides.

2.4.8.8.2 Farm men and women thus belong to different categories and require differential support. However, there are many generic problems affecting the farming community as a whole. Therefore, the Central and State Governments should assist the growth of Farmers’ Associations which can empower the voiceless. Voicing the voiceless and reaching the unreached should be major goals of public policies relating to the agrarian population.

2.4.9 Credit and Insurance

2.4.9.1 The need is to improve the outreach and efficiency of the rural banking system. The financial services must reach all its users effectively; the credit must be in time, in required quantities and at appropriate interest rate. NCF had recommended an interest rate of 4 per cent per annum and the Government of India had met this recommendation partly, by announcing credit availability to farmers at 7 per cent up to Rs. 1 lakh. It should be possible to bring about a considerable reduction in transaction cost by eliminating all forms of ostentation in the operation of the banking system. The inefficiencies of delivery system should not be loaded on borrowers. The delivery system has to be proactive and should respond to the needs of the financial services in the rural areas in an efficient manner. The banking system needs to explore the large unmet credit potential for raising agriculture to higher thresholds, growth of rural and agri-business enterprises and employment. There is also need for considering a credit cycle of 4 to 5 years in chronically drought prone areas, so that farmers will be able to repay the loans when there is a good monsoon leading to a good crop.
2.4.9.2 The State has a responsibility in improving the credit absorptive capacity of the farmers and to support the banking system by creating favourable environment for expanding and deepening of financial services by the banks.

2.4.9.3 NABARD as the leader of agriculture and rural credit should ensure convergence among credit availability, credit absorptive capacity of the farmers and other rural borrowers and an efficient credit delivery system, by providing financial and technical assistance to the banking system and necessary inputs to the State. As a development bank, NABARD should actively involve in institution building and provide back up support through research and development initiatives.

2.4.9.4 The Reserve Bank and Government of India have to broadly assign the role and responsibilities to different agencies in the multi agency system and ensure implementation of their policies and programmes.

2.4.9.5 Agriculture is a high risk economic activity. The farmers need user friendly insurance instruments covering production right from sowing to post harvest operations and also the market risks for all crops throughout the country for insulating them from financial distress and in the process making agriculture financially viable. There is need for both credit and insurance literacy in villages.

2.4.9.6 Since part of the debt incurred by small and marginal farmers and landless labour is for healthcare, priority should be given in extending the benefits of the National Rural Health Mission to areas affected by agrarian distress.

2.4.10 Cooperatives

2.4.10.1 The cooperatives have an important role to play particularly in banking, marketing, agro-processing and other agri-businesses to protect the farmers from the vagaries of existing imperfections in the supply of inputs, production, value addition and marketing etc. and also in the process improve their welfare. The cooperatives are basically economic enterprises (not an extended arm of the State) and require entrepreneurial approach. They should not only gather competitive edge through suitable
enterprise focus on the traditional primary value creating activities, but also in secondary value creation activities through suitable strategic alliances with private and public sector units. The need is to identify means and measures by which the farmers could gain power of scale and economies, which they otherwise do not have, obtain greater control of the market channels and improve their chances of being profitable.

2.4.10.2 For achieving the above objectives, the policy and legal framework under which the cooperatives are functioning would require to be reviewed, so as to create enabling environment for them, to attain autonomy to run their operations in business like fashion, without rigid controls and regulations imposed by the State laws. To succeed and serve the farmers to their full potential, the cooperatives need to function as voluntary, member driven, autonomous and largely self-regulating organisations, working on the principles of self-help. The management of the cooperatives needs to be professionalised with clear demarcation of functions of the elected members and the professional managers. The audit and accounting systems also has to be improved, so as to give greater confidence to all those who are associated with them.

2.4.10.3 With economic liberalisation and market competitiveness, the cooperatives would require much larger capital and other financial resources to be successful. However, the changes in legal framework, regulatory system and constraints in liberal State support would necessitate identification of new ways and means, as also instruments to gain greater access for the cooperatives to capital/financial resources and removal of impediments due to law and regulations in capital formation, which prevent the members from obtaining the benefits of surplus retention in the business. Opportunities to increase non-members financing, consistent with the objectives of cooperation will also have to be explored.

2.4.11 Assured and Remunerative Marketing Opportunities

2.4.11.1 Assured and remunerative marketing opportunities hold the key to continued progress in enhancing farm productivity and profitability. Already, several significant market reforms have been initiated by the Union Ministry of Agriculture. The State
Governments will have to undertake such reforms speedily in order to provide more options to the farmers for selling their produce, allowing the private sector including the cooperatives to develop markets, promote direct sale to the consumers and removing bottlenecks and scope for corruption and harassment. What farmers seek is greater protection from market fluctuations. The Minimum Support Price (MSP) has to be protected more effectively across the country. Of late, the farmers have been feeling that the MSP of crops have not kept pace with the rising input costs. Likewise, the Market Intervention Scheme (MIS) should respond speedily to exigencies, especially in the case of sensitive crops in the rainfed areas. Similarly, the establishment of Community Foodgrain Banks would help in the marketing of underutilised crops and thereby generate an economic stake in the conservation of agro-biodiversity. Indian farmers can produce a wide range of health foods and herbal medicines and market them under strict quality control and certification procedures. The Public Distribution System (PDS) can also be encouraged to store and sell nutritious millets with appropriate price support to farmers.

2.4.11.2 Farmers require authentic advice based on meteorological, marketing and management information for land use decisions/investments etc. Restructured Land Use Boards supported by a team of technical experts/agencies could render this service. Infrastructure support has to be put in place to minimise post harvest losses and enable agro-processing and value addition at the village level itself to promote livelihoods. The collective strength of farmers has to be built up by encouraging farmers’ organisations and other entities like cooperatives and small farmers’ estates, so that they can get a fair deal and enjoy the economies and power of scale. The farmers, particularly the small and marginal farmers need pledge loans to be able to avoid distress sale and sell their produce when the price is favourable. Constraints in improving the negotiability of warehouse receipts also need to be removed.

2.4.11.3 NCF had recommended in its Third Report the establishment of an Indian Trade Organisation (ITO), which will safeguard the interests of farm and fisher families by providing a Livelihood Security Box to ensure fair trade. The Livelihood Security
Box should have provision to impose quantitative restrictions on imports and or/increases in import tariffs, under conditions where imports of certain commodities will be detrimental to the work and income security of large numbers of farming families. It should be emphasised that **there is no level playing field between the capital, subsidy and technology driven mass production agriculture** of the industrialised countries, and the ‘production by masses’ agriculture of India characterised by weak support services, heavy debt and ‘resource and technology poverty’. The steps recommended by NCF for promoting an **Indian Single Market** need to be examined and implemented. The bottom line of our trade policies in agriculture should be the economic well being and livelihood security of agricultural families. Nothing should be done which will destroy job opportunities in rural India.

2.4.11.4 Quality and trade literacy programmes have to be launched across the country. In relation to commodities which are exported, it will be essential to conform to WTO regulations. At present, such commodities constitute about 7 per cent of total agricultural production in the country. Farmers’ Associations and SHGs should be helped to export on competitive terms by spreading awareness of the opportunities available for external agricultural trade. In such cases, cost, quality and reliability of supply will determine long-term trade relationships. The agri-export zones should be further strengthened and should become places where farmers will get the best possible price for their produce.

2.4.11.5 The consumption capacity has to be increased within the country through the infusion of more purchasing power in the hands of families currently caught in the poverty trap. Farmers, who are also the largest consumer group, will produce more, if there is greater consumption and consequently greater demand for farm produce and products. **The Food Guarantee Act** recommended in the Second Report of NCF would help to make food serve the role of currency. Such a procedure will help to improve household nutrition security as well as farmers’ income. The future of Indian agriculture will depend upon the efficiency and seriousness with which pro-farmer marketing systems are put in place.
2.4.12 Public Policies for Sustainable Livelihoods

2.4.12.1 The cost-risk-return structure of farming is getting adverse, leading to increasing rural indebtedness. In addition to those already mentioned, the following steps will help to ensure that the well-being and livelihood security of all included under the category of “farmers” in this policy statement become the bottom line of public policies.

i. The scope of the Minimum Support Price (MSP) programme should be expanded to cover all crops of importance to food and income security for small farmers. Arrangements should be made to ensure MSP at the right time and at the right place, particularly in the areas coming within the scope of the National Rainfed Area Authority. 

   **Also, advice to farmers on crop diversification should be linked to the assurance of MSP. Small farm families should not be exposed to administrative and academic experiments and gambles in the market.**

ii. A Market **Risk Stabilization Fund** should be established jointly by Central and State Governments and financial institutions to protect farmers during periods of violent fluctuations in prices, as for example, in the case of perishable commodities like onion, potato, tomato, etc.

iii. There is also need for an **Agriculture Risk Fund** to insulate farmers from risks arising due to recurrent droughts and other weather aberrations.

iv. The scope of Agricultural Insurance Policies should become wider and there should also be coverage for health insurance, as envisaged under the **Parivar Bima Policy** recommended by NCF in its First Report. There should also be insurance provided by Seed Companies in the case of GM crops, so that farmers who pay high prices for the seeds for such crops do not suffer in case of crop failure.

v. Nutrition support to rural families affected by HIV/AIDS, tuberculosis, malaria and leprosy is needed to assist in recovery and restoration to a productive life. There is evidence to suggest that a pure drug based approach alone, is not
adequate to help economically underprivileged rural women and men recover from diseases involving prolonged treatment. In addition to health insurance, about 2 million tonnes of foodgrains may be earmarked for launching a Nutrition-cum-Drug Based Approach to getting farm families restored to normal health. A basic requisite for enhancing small farm productivity is the health of the farm worker. This is particularly true in the case of women suffering from a multiple burden on their time. The food grains allotted to such a programme can be distributed through the normal channels on the production of a Food Coupon issued by the appropriate government agencies. For example in the case of HIV/AIDS, the National AIDS Control Organisation (NACO) would be the appropriate agency for the issue of food coupon to the children, women and men affected by this debilitating and killing disease. The Food-cum-Drug based approach to healthcare should become an integral part of the National Rural Health Mission.

vi. An **Indian Trade Organisation** (ITO) and an **Agro-ecological Land Use Advisory Service** should be established on the lines recommended by NCF in its Third Report. The ITO should help Government to operate a Livelihood Security Box.

vii. Since agriculture is a State subject, every State Government should set up a **State Farmers’ Commission** with an eminent farmer as Chairperson. The Membership of the Commission should include all the principal stakeholders in the farming enterprise. Such Commissions should submit an Annual Report for being placed before the respective State Legislature for discussion and decision.

viii. Agricultural progress should be measured by the growth in the net income of farm families. Along with production growth rates, income growth rates should also be measured and published by the Economics and Statistics Directorate of the Union Ministry of Agriculture.
ix. Article 243 G of the 11th Schedule of the Constitution (73rd Amendment) Act, 1992 entrusts Panchayats with responsibility for agriculture including agricultural extension. In addition, Panchayats will also have to attend to:

- Land improvement, implementation of land reforms, land consolidation and conservation.
- Minor irrigation, water management and watershed development.
- Animal husbandry, dairying and poultry.
- Fisheries.
- Social forestry and farm forestry.
- Minor forest produce.
- Small scale industries, including food processing industries.

2.4.12.2 At the moment there are about 2,25,000 panchayats in the country. The problems facing Indian Farmers are generally dealt with in an aggregated manner – i.e., taking into consideration the problems of over 100 million farming families as a whole. They then appear formidable. **However, if such problems are disaggregated and dealt with by Gram Sabhas and Panchayats, location-specific problems can be attended to speedily and effectively.** The extreme distress faced by farmers in certain regions of the country can then be dealt with promptly. Therefore, it is time that the provisions of Article 243 G are implemented, both in letter and spirit. NCF in its earlier reports had recommended that Panchayats should be involved in water conservation and management as well as in the resettlement of those who will be displaced by big dams through Gram Sabhas serving as Pani Panchayats. Also, one woman and one male member of the panchayat should be trained to serve as Farm Science Managers. In the areas prone to drought, floods and cyclones, one male and one female member could also be trained to serve as Climate Managers. Panchayats could also be the location for the Village Knowledge Centres. They can then play a very important role in agricultural renewal and renaissance.

2.4.12.3 In addition to the resources being made available by the Government of India, State Governments should show their commitments to farmers’ livelihood through greater allocation of resources in the State budgets.
2.4.12.4 Finally, the name of the Ministry of Agriculture both in the Centre and States should be changed to Ministry of Agriculture and Farmers’ Welfare in order to highlight the critical role of these Government Departments in ensuring the income and work security of over 600 million members of India’s population.

2.4.13 No Time to Relax

2.4.13.1 The consequences of inaction in addressing the prevailing agrarian distress will be disastrous. Mentioning three of them would be adequate to highlight the serious implications of neglecting the “Jai Kisan” commitment.

- Expansion of threats to internal peace and security (e.g. spread of Naxalite Movement)
- Reverting to a ship-to-mouth existence, thereby diluting national sovereignty and enlarging the rural-urban divide in economic growth
- Jobless or even job-loss economic growth resulting in joyless growth for nearly half of our population.

If agriculture goes wrong, nothing else will have a chance to go right. If conversely agriculture goes right, the vision of a hunger and poverty free India can become a reality sooner than the timeframe set under the UN Millennium Development Goals.

2.4.14 Avoiding a Mismatch between National Policy and Agro-climatic, Socio-economic and Socio-cultural Diversity

2.4.14.1 Indian agriculture is rich in diversity of soils, climate, farming communities and systems, and resource endowments. Hence, a broad national policy will have to be tailored to suit different agro-climatic, socio-economic and socio-cultural factors, by the local stakeholders. The framework for a National Policy for Farmers presented in this Report will have to be suitably adapted and elaborated to suit local realities in different parts of the country, particularly with reference to priorities in action points.
2.4.15 Way Forward

2.4.15.1 NCF will hold regional consultations with State Governments, Farmers’ organisations including Women’s organisations, all other stakeholders and mass media between May - August, 2006. On the basis of the inputs and advice received, the draft National Policy for Farmers will be revised and a second draft will be included in the final Report to be presented on October 13, 2006, when the term of NCF ends.

2.4.15.2 NCF requests the Ministry of Agriculture to get this draft policy considered by the NDC Committee on Agriculture, the Agriculture Coordination Committee chaired by the Prime Minister, Consultative Committee of Parliament and other appropriate bodies.

2.4.15.3 The Final draft could be put up by the Ministry to Cabinet, NDC and Parliament early in 2007 so that a National Policy for Farmers can be launched for the first time in 10,000 years of India’s agricultural history on 15th August, 2007. Suitable financial provision may be made in the budget for 2007-08 for making the Policy operational.
CHAPTER 3.1
GUIDING PRINCIPLES UNDERLYING THE DRAFT
NATIONAL POLICY FOR FARMERS

BACKGROUND

3.1.1 Agriculture plays an important role in the overall economic and social well
being in the country. Though the share of the agriculture sector in the GDP is declining,
it still accounts for nearly 21% and remains the biggest sector after services. The
contribution of manufacturing sector in GDP is nearly 38% lower than that of agriculture.
Incidentally, the farm production sector is the most privatized sector in India, decision on
what, how much, when, how to produce and sell are taken by individual farmers. More
than half of the work force in India is engaged in agriculture or activities allied to
agriculture. It is the agriculture, which provides food and nutrition to the population and
raw material to a large number of industries. Nearly one-sixth of the total export earnings
are from agriculture.

3.1.2 There is no doubt that Indian agriculture has made significant progress in the
post independence period particularly in the wake of the Green Revolution. The
foodgrain production increased to a level of 212.1 million ton in 2003-04 [Mid-Term
Appraisal of the Tenth Five Year Plan] as against only 89.36 million ton in 1964-65. The
production of oil seeds, sugarcane, cotton, fruits/vegetables, milk and poultry meat/eggs
also increased appreciably. The main factors for growth of agriculture have been increase
in net area sown, expansion in irrigational facilities particularly tubewells, land reforms
especially consolidation of holdings, introduction of the high yielding seeds, increased
use of fertilisers, expansion of institutional credit in the rural area after the nationalization
of private sector banks, farm mechanisation, price policy based on MSP and the
procurement operations and improvement in rural infrastructure particularly roads/ rural
electrification etc. With the result, over the years, India has moved from food shortages
to self-sufficiency, at least in terms of physical quantities of grains and now exports a
variety of food items. The sector has enabled the country to reach food security at the national level and in the process maintain national security.

3.1.3 However, the absolute numbers of agriculture production, cover up many harsh realities in regard to our agriculture development and the economic welfare of the farmers. For a developing country like ours striving to achieve a higher growth path, it is important to look at agriculture as just not a means of providing food to the population but as sustaining incomes of those producing it and linked to it. Livelihood of nearly two-third of India’s population is dependent on agriculture and the objectives of a welfare state cannot be met unless their incomes are adequate and growing in a sustainable manner. This would require a relook at our policies and planning for this sector with farmer at the centre stage. In any case, farming ultimately is a business activity and like any other business, the bottom line is crucial. The current agricultural scenario based on the assessment of the Planning Commission, Government of India is given at Annexure I. The assessment is disturbing to say the least. Not giving sufficient importance either to the man behind the business or the bottom line could only be disastrous. Some of the issues impacting the farmers are discussed in the following paragraphs:

3.1.4 The low average yield is a major issue. According to the Government of India data, the average yield of foodgrains [covering over 65% of the gross cropped area] was 1.74 ton per hectare in 2001-02. However, in 57% of the area, the average yield was less than 1.5 ton per hectare and only in 8.54% area; the yield was above 2.5 ton per hectare. Another worrisome issue is that even in Punjab and Haryana [the only States with average yield was above 2.5 ton per hectare] the yields of wheat and rice are plateauing in absence of newer technological advances. The yield growth of these crops [covering 58% of the area under foodgrains] decelerated throughout the 1990s to about 1% per annum from 3% during the 1980s indicating a potentially serious exhaustion of technological progress1.

---
1 Mid Term Evaluation of the Tenth Five Year Plan.
3.1.5 Together with low yields, the other serious handicap faced by our farmers is the small and scattered operational holdings. The average holding size has come down from 2.67 hectare in 1960-61 to 1.34 hectare in 1990-91. The number of operational holdings has increased by above 82% [from 51 million in 1960-61 to 93 million in 1991-92] in three decades. The land distribution in India is very skewed as shown below:

Table 1: Distribution of Ownership Holdings in Rural India -1991-92

3.1.6 The landless, sub-marginal [upto one acre] and marginal [1 acre to 2.49 acre] farmers formed 71.87% of the rural households and held only 16.93% of the land. The small farmers [2.50 acre to 4.99 acre] formed another 13.42% of the rural households and owned 18.59% of the land. The landless, marginal and small farmers formed 85.29% of the total rural households in 1991-92 which increased to 88.9% in 1999-2000. The pressure on land and lack of alternative employment opportunities has led to proliferation of small and economically non-viable holdings. The percentage of holdings of less than 5 acre has increased from 61.69% in 1960-61 to 78.2% in 1990-91 and to 80.3% in 1995-96 [Agriculture Statistics at a Glance – 2005, Ministry of Agriculture, Government of India]. An average size of operational holding declined from 1.57 hectare in 1990-91 to 1.41 hectare in 1995-96. The average holding was divided into 2.7 parcels. As land continues to be the most prized possession and single most important determinant of the socio economic status of the people in rural India [also provides collateral for credit and

2 NSS Report No. 458 – Report on Employment and Unemployment Situation in India

3 According to the NSSO Report No 500- Household Assets and liabilities in India [as on 30th June, 2002], as much as 63.2% of the total assets of rural households were in the form of land & 23.5% in the form of building.
security in the event of natural hazard or life contingencies] and tenancy laws prohibiting/strongly discouraging leasing of land, the fast growth of the rural population, the succession laws and absence of alternative employment opportunities means that the average ownership/operational holding sizes would continue to decline even further. Increasing small farm productivity and improving small crop-livestock integrated production systems and multiple livelihood opportunities through agro processing and bio mass utilization, are essential both to meet food production targets and also reducing hunger, poverty and rural unemployment. Development of animal husbandry could play an important role in augmenting income of the small/marginal farmers. The share of these farmers in dairy farming is quite substantial. They form the core of the milk production sector. Taken together [small and marginal farmers] accounted for 71% of the in –milk bovine stock in 2002-03. The marginal farmers, who had only 20% of the in-milk bovine stock in 1970-71, increased it to 31% in 1981-82, to44% in 1990-91 and to 52% in 2002-03.

3.1.7 The tenancy laws are an important issue. These laws, which aimed at ensuring security to tenants and firming fair land rents were enacted against the background of exploitation of tenants. Kerala and J&K have completely banned leasing out of agricultural land, while in Telangana in A. P., Karnataka, H. P., M. P. and U. P. leasing out agricultural land is allowed only in case of certain disabled persons like widows, minors, personnel of armed forces etc. Punjab, Gujarat, Haryana, Maharashtra and Assam have not banned leasing out agricultural land but the tenant acquires a right to purchase the leased in land within a specified period of tenancy. In A. P. [other than Telangana], Orissa, Rajasthan, Tamilnadu, and West Bengal there are no restrictions on land leasing excepting that in West Bengal only sharecropper leases are allowed. In the tribal areas of A. P., Bihar, Orissa, M. P. and Maharashtra, only competent authority can permit the transfer of tribal land to non-tribal. However, the various loopholes and difficulties in actual implementation has meant that leasing of agricultural land continues to be done [around 10.36 million hectare was leased during 1991-92 which formed 8.2% of the total cultivated area] but in many places in a concealed manner with all its attendant evils, [including formal credit exclusion] which could be more
exploitative to the leases particularly the land less, marginal or small farmers. Incidentally, the small/marginal farmers are major players in the land lease market. Increasing cost of cultivation, falling returns, non-availability of irrigation and problems in accessing institutional credit are some of the factors leading to leasing out land by small/marginal farmers. In certain States the fall out of existing tenancy laws is that some of the farmers opt to keep land follow in the event of their moving to the town/ cities for employment. This not only adversely affects production but also leads to deterioration in the quality of land. This phenomenon is more widespread in UP, Karnataka, Kerala, H.P., Jammu and Kashmir and A. P. where leasing out agricultural land is either completely banned or is allowed only in the case of certain disabled categories like widows, minors, armed forces personnel etc.

3.1.8 The tenancy laws have to be such as to encourage all sections of rural population to participate in the land lease market depending upon their resources, availability of off farm/ non farm employment opportunities, the wage rate, cropping pattern and income possibilities from use of land in agricultural and activities allied to agriculture. However, there should be no fear of loss of land leased out to others. In areas where agriculture is well developed, wages are high and non-farm employment opportunities broad based, it may be an attractive alternative for small/marginal farmers to lease out their land and take up wage employment/start-an independent tiny/ micro enterprise if the law assures that they would not be deprived of their land. The medium/big farmers could improve scale economies by leasing in land. On the other hand, in States where agriculture is relatively backward, wages low and alternative employment opportunities limited, the small/ marginal farmers could lease in land from medium to big farmers who may like to migrate to urban areas for non-land based employment/ business opportunities. Some of the safeguards in developing land lease markets could be (a) The lessees should be able to resume the land for self cultivation after expiring of lease term. (b) In case of land leased out by small/marginal farmers, the ownership rights should not be conferred on the tenants. (c) The medium and larger farmers should not be allowed to purchase leased in land from small/ marginal farmers.
3.1.9 Low intensity of cultivation is another issue. Due to concentration of rains in a few months in one season [that too in few days] and limitations in development of irrigation, the cropping intensity has not gone beyond 1.37 for the country as a whole, though theoretically it is possible to grow three corps in a year in a large part of our country. The average decadal growth in cropping intensity has been around 1.25% per annum. Large part of our country had cropping intensity of less than 1.30. The cropping intensity across States during 1996-97 is shown in Table 2.

Source: State of the Indian Farmer: A Millennium Study – Land Resources

3.1.10 While other than China, the irrigation system in no other country is as extensive as in India; still only 35.9% of the operated area in 1991-92 was irrigated. However, it is this irrigation system, which has fuelled India’s growth in agriculture production. Irrigation has acquired additional importance since the Green Revolution, which is characterized by the use of high-yielding seed varieties, intensive use of fertilizers and other inputs. These inputs are more effective if used alongwith regular and adequate supply of water. This system of agriculture is often seen as the face of Indian agriculture attracting most of the attention of the policy makers and the input delivery system. The risk factor in rainfed agriculture, constraints the farmer from intensive usage of inputs and this farming is generally associated with low yield, low income farming carried on by those who are staying on in agriculture for want of other alternatives.

3.1.11 There are large inter State variation in the extent of irrigation. In Punjab and Haryana nearly 73% area was irrigated followed by U. P. [67.06%], Tamil Nadu [47.46%], West Bengal [44.87%] and Bihar [41.09%]. While the Gangetic plains and the Eastern coast has achieved a relatively enhanced stage of irrigation development the arid
region and the high rainfall receiving areas have a low level of achievement. The results of excessive irrigation are also becoming evident in some developed areas in the form of rapid depletion of ground water, deterioration in ground water quality and the problem of water logging. The tubewells were the major source of irrigation accounting for 36.37% of the irrigated area, followed by canals [26.04%], wells [18.11%], tanks [3.84%], other sources [7.2%] and for the balance 8.44% the source of irrigation was not reported. In Punjab 83.66%, Uttar Pradesh 66.94%, Bihar 51% and Haryana 42.22% of the irrigated area was irrigated by tubewells. Canals were the major source of irrigation in Orissa [54.17%], Haryana [49.75%] and Rajasthan [34.17%]. Tanks were largely used in A. P. Tamil Nadu, Karnataka and Orissa. Wells were the primary source of irrigation in Maharashtra [54.85%], Tamil Nadu [41.49%], Gujarat [44.9%], Madhya Pradesh [33.10%] and Kerala [32.33%]. The major problems concerning irrigation are the falling investments in development of irrigation in public sector, poor maintenance of canals/other water bodies, the issue of water charges, the actual irrigation developed being much below the potential created, depletion of ground water in many areas [large number of blocks coming in the ‘dark’ category where further ground water development is not supported by institutional finance], falling water table, energisation of tubewells, poor quality of power supply and need for much greater use of water saving devices/practices, micro irrigation systems etc.

3.1.12 The trends of changes in the net irrigated area to the net sown area across various classes of farmers show that the percentage of net irrigated area to net sown area was consistently much higher in the case of farmers upto 5 acre holdings [throughout 1970-71 to 1990-91] than the medium and large farmers. In 1990-91, 43.6% and 35.7% of the net area sown by marginal and small farmers respectively was irrigated whereas the percentage in respect of the medium and large farmers was only 29.7 and 22.5 respectively. However, the annual compound rate of growth of irrigation between 1970-71 & 1990-91 was highest in the case of big farmers [2.78%] followed by medium farmers [1.90%] and was lower in the case of Semi-Medium farmers [1.33%], small farmers [1.24%] and marginal farmers [1.28%]. With declining public sector investment,
the small/marginal farmers and areas with lower irrigation development need special focus and dispensation for irrigation development.

3.1.13 Another important aspect is that the Indian farm economy is largely crop based. Nearly 79.2% of the holdings in 1991-92 were used mainly for raising crops, 8.2% for livestock, 1.5% for poultry, 3.9% for plantation/horticulture and the balance of 7.1% for other purposes. Food grains are the main crops. However, some changes are taking place in the cropping pattern. In 1980-81 nearly 80.35% area was under foodgrains, which came down to 75.38% in 1990-91. The decline has been across all the size classes i.e. marginal/small, medium and big farmers. However, the decline is slightly sharper in the case of medium and big farmers. Among the cereal, the decline in so called ‘coarse cereals’ is heavy. The area under coarse cereals came down from a high of 45.95 million hectare in 1970-71 to only 30.80 million hectare in 1999-2000, though the production level marginally increased from 30.55 million ton to 32 million ton during the above period. The area under pulses has also declined during 1970-71 to 1990-91 across all size classes of farmers. [From 13.36% to 11.35%]. The area under oilseeds increased continuously from 1950-51 to 1990-91 [from 10.73 million hectare to 24.10 hectare] but remained more or less constant by 1999-2000 at around 24 million hectare. The percentage area under sugarcane, fruits/vegetables & spices has shown increases between 1980-81 and 1990-91. The area under jute/mesta and cotton together has remained more or less constant during 1980-81 and 1990-91.

3.1.14 The cropping pattern changes also show some movement towards international trade oriented crops and improvement in farmers’ price response and net income. It would also appear that cropping pattern changes are first led by medium farmers and followed by the large and small/marginal farmers.

3.1.15 Marketing is becoming a major issue with the farmers all over the country as they are shifting from the subsistence farming. The Karnataka study referred to in Second Report of the National Commission on Farmers [Serving Farmers and Saving Farming-Crises to Confidence] indicated that 71% of the sample farmers [sample size of 3408 farmers] in Karnataka chose not to sell their produce at the Regulated Markets. The
institutional rigidities have made the Regulated Markets imperfect and less responsive to market fundamentals and reduce the economic benefit to the farmers bringing their produce for sale. Farmers using the Regulated Markets complain of under weighing, unauthorized deductions, harassment by Collies/Hamals etc, inadequate infrastructure, long distance and lack of transparency in auctions etc. Further, very little efforts have so far been made in developing village periodic markets [Haats etc], which are the first contact point for the small farmers. In absence of comprehensive price and market support, small/ marginal farmers resort to distress sale of their produce where the buyer may pay 10-15% discounted price for spot payment and also cheat on them by under weighment and other deductions etc.

3.1.16 The existing minimum support price [MSP] policy coupled with procurement operations has benefited mainly the farmers growing rice and wheat and that too in a few States only. Though the MSP is announced for 25 commodities accounting for nearly 75% of the value of output and nearly 80% of the gross cropped area, the prices often remain lower than MSP in most of the markets in the country. Further, there are huge variations in the prices received by farmers in the same district or town leave alone the State. The farmers believe that of late the MSP have not kept pace with the increase in prices of inputs. **Further, the need for a much stronger protection of MSP in different regions of the country for all commodities cannot be over emphasized.**

Exploitation by traders/middlemen, less than satisfactory performance of the Agriculture Produce Marketing Committees, large supply chain, absence of grading, post harvest losses and lack of value addition means that the farmer gets much less than what he could get for his produce. Coupled with uncertainty of prices, the distress sales add to the farmers’ problems. As pointed out in the Second Report of the National Commission on Farmers referred to in the previous paragraph, micro level studies show that 50% of the small farmers’ produce is sold in distress. The need is for several policy level changes, increased investments and creation of more effective instruments, systems and structures to remedy the situation, including mitigation of market risks. Development of a farmer centric contract farming system deserves a high priority in this regard.
3.1.17 The terms of trade between the agriculture and non-agriculture is another issue. The latest series of index of term of trade [ITT] between agriculture and non-agriculture sectors with triennium ending 1990-91 as base shows that while the ITT moved continuously in favour of agriculture during 1981-82 and 1991-92, when index moved from 88.7 to 106.6 during 1992-93 to 1997-98 it fluctuated with peak reached in 1994-95 at 106.6. **Thereafter, the ITT has been moving downward with some fluctuations in between. The ITT was as low as 102.7 during 1999-2000 and only 101.2 during 2000-01.** The mid-term review of the Tenth Five Year Plan has observed under paragraph 5.9 that during 1997-2002, agricultural prices declined relative to prices not only of inputs but also non-food consumer goods. As a result, the purchasing power of agricultural incomes [current price GDP divided by consumer expenditure deflator] decelerated more than GDP at constant prices. Real farm incomes defined in this way not only show no per capita growth after 1997, but also exhibit increased variability.

3.1.18 The total factor productivity and the profitability in agriculture has declined in real terms in recent years. With the yields stagnating or growing very slowly, the prices of agricultural commodities remaining depressed in both national and international markets, the farmers have very little incentive for making investments in agriculture. The yields of crops like cotton, sugarcane, tobacco, soybean among important crops have shown negative growth during the last few years. As a matter of fact, low profitability and high risk are threatening the viability and sustainability of agriculture. The NSS data reveals that given the choice, about 40% of the farmers may like to quit agriculture. Farming no longer is able to attract or retain youth. Dr. Y.K. Alagh in the ‘State of Indian Farmer: A Millennium Study-An Overview’ has observed that the agriculture profitability has fallen by 14.2% during 1990-91 and 2000-2001. The margins deteriorated for cotton and for almost all coarse cereals and oil seeds. There has also been a deceleration in input use mainly because of inadequate expansion of public infrastructure and less favourable input prices during the 1990s. However, it needs to be remembered that for modernization of Indian agriculture the non-land based inputs would increasingly become more important and the farmers would have to rely more on purchased inputs. The deceleration in the growth of input use after 1996-97, to about 2%
per annum from over 2.5% per annum during 1980-97 is a matter of concern. This occurred mainly because the output prices had begun to fall relative to input prices from 1997-98 [Mid – Term Appraisal of Xth Plan – Paragraph 5.9]

3.1.19 ‘Improving farmers’ access to new technologies and coverage of more crops in research and development efforts rather than concentrating on few crops is important for productivity growth, cost effectiveness and profitability and income of the farmers at large. The crucial issue is to decide the role that needs to be assigned to agriculture research and extension and the direction in which it should proceed in future. There is a need for paradigm shift in research methodology and allocation of research efforts towards crops and condition of resource poor and rainfed agriculture.

**Farmers Income - Crucial Issue**

3.1.20 The welfare of the farmers is primarily linked to the level and trends in farm incomes. The income of the farming household depends not only on price-cost ratios, crop yields, cropping patterns and relative movement of farm prices to cost of living but also on farm size and cropping intensity. A very small average operational holding and low cropping intensity means that an average Indian farmer operates on very low-income levels. With continuous decline in average farm size as a result of faster growth of farm population than the cropped area, the outcomes per cultivator – are less favourable than the outcomes per hectare. This is a serious matter and often in the midst of overall agricultural growth figures [the aggregates], the fact that the average farming household does not gain as much escapes attention.

3.1.21 According to census data, the number of cultivators grew at 1.83% per annum during the Eighties and at 1.44% per annum during the Nineties. However, the land use statistics reveal that the growth of cropped area during the Eighties and the Nineties was only 0.40% per annum and 0.45% per annum respectively meaning thereby the constant reduction of cropped area per farming household. With productivity growth slowing down in the Nineties at 1.3% per annum as against 2.56 % per annum in the Eighties, the farm business income per farmer declined in some areas. The data suggests
that the real business income from farming per household declined in Andhra Pradesh, Bihar, Gujarat, Karnataka, Maharashtra, Orissa and Rajasthan during the nineties.

3.1.22 The total farm income from average farm size in Andhra Pradesh, Gujarat, Haryana, Punjab, Madhya Pradesh, Rajasthan and West Bengal during the late Nineties was not adequate to keep the family above the poverty line.

3.1.23 Prof. Abhijit Sen [presently Member, Planning Commission] has estimated that the average farm business income per hectare [return over cost i.e., all actual expenses in cash and kind incurred in production by owner operator plus rent paid for leased in land] for all states/crops during 1999-2000 was Rs 9252 which along with contribution of livestock was estimated at Rs 12,027 per hectare of cropped area. With average size of holding at about 1.42 hectare and all India cropping intensity at 135 per cent, the cropped area per farm works out be 1.92 hectare which could yield an income of Rs 23092 per annum. With average family size of 5.6, the per capita income worked out to only Rs 4124, which is hardly sufficient to provide the essentials of life with per day amount of only Rs 11.30. With productivity and income levels much lower than the All India average in States like Assam, Bihar, Madhya Pradesh, Karnataka, Maharashtra and Orissa the income would be much lower particularly where the average size of holding and cropping intensity is lower. Ensuring viability and sustainability of this vast rural population is a major challenge to our planners and policy makers. The problem is deep rooted and cancerous, which could destroy our entire social system if major shifts, and changes in policy, planning and resource allocation are not brought about quickly.

Farmers’ Suicides

3.1.24 Farmers’ suicides are not only persisting but are tending to increase and spread over wider area. The fundamental cause of the deterioration in rural economy is less than satisfactory performance of the agriculture sector. The low growth in agriculture per capita income and increasing disparity between per capita farm and non

---

4 Share of livestock in the gross value of agriculture has increased from 16% in 1970-71 to 26% in 1995-96.
farm income has been caused by both fast growth of rural population and relatively slow growth of agricultural and rural output as compared to other sectors of the economy. The disparity would further worsen unless there is a major shift in our policies and the farmer is brought to the centre stage of all our planning exercises.

3.1.25 In the wake of commercialisation of Indian agriculture, many small/ marginal farmers enter the high-risk commercial farming from a position of extreme vulnerability due to meagre asset base and lack of knowledge of technology and familiarity/ support for handling the market forces. The cyclical nature of farming with occasional blessings encourages them to take risks much beyond their capacity. When these expectations are not met due to natural factors or human greed [supply of spurious seeds, pesticides and credit from money lenders at exorbitant rates etc.], these farmers suffer a great deal. The farmers are generally in a position to manage one cycle of drought or other distress but are most likely to succumb to it if the cycle was repeated. It is the successive droughts, loss of crops, illness, high expenses on social events/ obligations, collapse of market, a major loss of asset or earning system/ capacity, which causes severe unbearable distress among the rural people. The crumbling of kin-social net working, support systems and institutional system has compounded the problem causing great distress sometime leading to the greatest disaster to the family in the form of suicide by the breadwinner. Effective and farm reaching efforts are required to eliminate these distress factors and convert the hot spots of agriculture into bright spots.

3.1.26 It is important that public investment in agriculture and rural development is stepped up and there is greater focus on improving grading, storage, marketing and processing of agricultural produce to improve farmer’s incomes from per unit of output.\(^5\)

Infrastructure investments for better rural road connectivity, availability of quality power

\(^5\) Public sector investment plays an important role in the development of infrastructure like irrigation, electricity, agriculture research, markets, roads etc. The decline in public sector investments is particularly harsh on underdeveloped areas, which attract less private sector investments. [The private sector investment is influenced by availability of enabling infrastructure and expected returns from investments. In absence of public sector investments in infrastructure, which increase the returns from investments, private sector is also likely to ignore such areas]. The share of public sector in gross capital formation in agriculture declined from 33% in 1993-94 to 24.2% in 2000-01. The gross capital formation in agriculture as a proportion of the total gross capital formation in India has also continuously declined. [from 14.3% in 1970-71 to 7.1% in 2001-02].
supply, building human capital through education, training, quality assurance, timely input supply and sound advice based on market/weather forecasts etc. and greater focus or providing support for development of animal husbandry activities [backward and forward linkages] could help in improving the welfare of small / marginal farmers in India. An important aspect is to provide power of scale to farmers by encouraging formation of small farmer’s estates/ cooperative farmers’/ the self-help groups/ or corporate farming units etc. The Cooperatives could play an important role in various marketing related functions like collecting farmer’s produce, grading, transporting, initial processing, marketing and supplying of inputs etc. The need is for policy bias in favour of group approach for delivery of services, marketing, avoiding over capitalization and greater use of labour intensive technologies.

Agricultural Credit- Access and Other Issues

3.1.27 Access to institutional finance is important particularly in diversification and switching over to commercial and high value agriculture. Further, the small farmers whose operations and surpluses are small could ill afford high cost loans from non-institutional agencies. However, the World Bank, National Council of Applied Economic Research [NCAER], Rural Finance Access Survey [RFAS-2003] conducted in U. P. and A.P. indicated that the banks served primarily the needs of the richer rural borrowers: 44% of the large farmers were borrowers whereas 87% of the marginal farmers did not have access to credit. Access to formal credit was particularly a problem for meeting unforeseen expenditure and resulted in heavy reliance among poorer households on informal sources, mostly moneylenders, traders and sometimes friends and relatives. The interest rate charged by informal sources was invariably quite high [around 48% per annum]. As per available data\(^6\), as much as 55.2 per cent of the loans outstanding at the farmer household level were from the formal institutions (35.6 per cent from banks and 19.6 per cent from the cooperatives) 25.7 per cent from the professional money lenders, 8.5 per cent from relatives/ friends, 5.2 per cent from traders and the balance of 5.4 per cent from others including government (2.5 per cent). However, in Andhra Pradesh,

Rajasthan, Manipur, Meghalaya the loan outstanding from professional moneylenders exceeded that from the banks and the cooperatives put together. As regards the outreach, the professional moneylenders had the largest percentage of farmer household indebted to them. The position was as under:

**Table 3: Indebtedness of Farmer Households**

<table>

</tr>
</tbody>
</table>

It is rather disturbing that after nearly 37 years of the nationalization of private sector banks and over fifteen years of credit targeting for agriculture, on all India basis the banks had a smaller outreach of the Indian farmers as compared to the professional moneylenders. In Andhra Pradesh, Bihar, Manipur, Meghalaya and Rajasthan the combined out reach of the Government, banks and cooperatives [the formal sector] was less than that of the moneylenders. More than 50% of the farmers’ households in Andhra Pradesh and Tamilnadu were indebted to moneylenders. The cooperative societies had the best out reach among all agencies [institutional as well as non-institutional] in Maharashtra [61%], Haryana [44%], Kerala [46%], Gujarat [40%], Punjab [38%], Chhattisgarh [37%] and Madhya Pradesh [37%].

3.1.28 In Eastern India where large growth potential has largely remained unexploited due to various reasons including credit constraints the outreach of the formal credit system needs considerable improvement. Excepting Orissa, Jharkhand and Tripura, friends and relatives [Meghalaya, Arunachal Pradesh, Manipur, Assam, Bihar, Mizoram] and Traders [West Bengal, Sikkim, Nagaland] were having the largest outreach.
3.1.29 Besides the question of restricted outreach of the banks, the other issues, which are resented by the rural borrowers, are the cumbersome lending procedures, documentation delays and difficulties, time taken in appraisal/sanction of loans, rigidities in lending, lack of appropriate products and insistence on collaterals by the banks. The adequacy and timely availability of credit is crucial for the farmers which does not get the required attention from the banks. The small borrowers are almost alienated from the commercial banks, which are often viewed by them as institutions for the rural elite. There is a need for streamlining the institutional lending procedures, improve the outreach and increase the supply of credit to farmers on a priority basis. There is very large regional imbalance in flow of institutional credit which needs to be corrected. The per capita credit in 1996-2001 in North Eastern Region [Rs. 17], Eastern Region [Rs. 42], Central Region [Rs. 86] was much lower than Northern Region [Rs. 153] and Southern Region [Rs. 280] and all India average of Rs. 128. Investment credit which adds to the total assets in the farming section, adds to the productivity of farms and helps in value addition is important. However, the proportion of investment credit in total credit has been declining. Since most of the investment credit is supported by mortgage/charge of land, there is a need to improve the land record system, streamlining the system of creating charge/mortgage, improve availability of land records, reduction in stamp duty/registration charges etc. to facilitate flow of more term credit. The State Governments may also look at the infrastructure/other backward and forward linkages etc. which could add to absorptive capacity of the farmers for increased credit. North Eastern Region where land vests with the Government/Community or oral lease holders, who can not mortgage land, would require special documentation from banks which in turn would require to the assured of assistance from State Government/Revenue Authorities etc. to recover their dues from such borrowers in case of default. Strengthening and supporting the more friendly and pro small clients localised banking institutions [the cooperatives, cooperative banks and the Regional Rural Banks] and providing separate dispensation to them to overcome their handicaps [higher risk profile and small geographical operational area, higher cost of funds etc.] are needed on a priority basis. The commercial banks need to relook their recruitment and personnel policies to have technically competent and willing staff to man the rural branches. The
rural branch managers need to be innovative and should be able to respond to the local situations and credit needs. The requirement of credit are likely to go up considerably with increase in purchased inputs, commercialization of agriculture, growth of agric-business opportunities [with improved connectivity] etc. and the rural branch managers can not continue to work in a routined manner responding only to traditional cropping pattern and extending investment credit for well known schemes of milch animals/tubewells and tractors etc.

3.1.30 Another issue is the risks, which the farmers face due to natural calamities, sudden pest attacks, diseases, market failure etc., which seriously impact their incomes and livelihood security. The risk profile is very high in rainfed farming which makes it nearly impossible for these farmers to switch over to commercial/high value crops to any significant extent. They are reluctant to use purchased inputs due to the uncertainty of production. Though the crop insurance scheme is being implemented since 1985 [which was widened in scope and content and introduced as National Agriculture Insurance Scheme’ in 1999] it has generally failed to attract and satisfy farmers mainly because of a large insurance unit [taluka/block to assess the loss instead of the farmer], the guaranteed yield fixed at 3 or 5 years average, low indemnity level [60% in most of the crops], inordinate delay in settlement of claims [as much as 12 months in many cases], non-coverage of crops like fruits/vegetables etc. The need is to thoroughly revise the crop insurance scheme and make it farmer friendly. An insurance scheme which does not promptly provide relief if the event for which insurance was taken happens, but looks at the average yield data for a tehsil/block and takes a long time in settlement of claim is not appreciated by the farmers. The Situation Assessment Survey of Farmers done by the NSSO [NSS Report No 496: Some Aspects of Farming 2003] reveals that at the all India level, only 4% of farmer households reported ever having insured their crops. Among those who had never insured their crops, a very large proportion-57% were unaware of the practice of crop insurance. While 16% were aware but not interested, 24% said that the facility was not available to them and 3% felt that they could not afford to pay the premium. Lack of awareness and interest in a scheme, which is in operation for nearly 20
years, is a sad commentary on the development/promotional efforts and nature of the scheme.

3.1.31 In absence of an effective crop insurance system, the successive droughts/natural calamities etc seriously erode the repaying capacity of small farmer/rainfed farmer who becomes a defaulter if he/she is unable to service institutional credit. The normal policy of reschedule/conversion of short-term loans into medium term loan in such situation is not really enough. The farmers in the event of successive droughts/natural calamities require ‘relief’ and not mere shifting of repayment obligation to future dates. The need is to constitute a Agriculture Credit Risk Fund to support the banks particularly the small localised banks to provide relief to the farmers in these conditions.

**The WTO**

3.1.32 At the time of signing the Agreement on Agriculture [AOA], it was hoped that the Indian farmers would gain from trade liberalisation and access to international markets for their products. The reduction in domestic support as well as export subsidies by other countries, particularly the Western countries and Japan etc. was expected to enhance competitiveness of our agriculture and result in gain to our farmers through exports. However, this has not happened. On the other hand, due to low tariffs, import of edible oils [palm oil in particular] has increased which has adversely affected the interest of our rain fed farmers diversifying into oil seeds. It would appear that the postponement of agreement in agricultural negotiations, inspite of our concerted efforts at Hong Kong [2005], would prolong the unequal trade bargain entered into in Marrakesh [1994].

3.1.33 There is a need for early consideration of the proposal made in the Third Report of the National Commission on Farmers [Serving Farmers and Saving Farming - 2006: Year of Agricultural Revival] for establishing an Indian Trade Organisation [ITO] and our own boxes for domestic agricultural support on the models of the WTO’s Blue, Green and Amber boxes. We need to segregate the support extended to farmers into two groups - those which are of the nature of life and livelihood support to small farm
families and those which could be considered as trade distorting in the international market. The first group of support measures needs to be strengthened for protecting the food and livelihood security of our farmers.

3.1.34 Incidentally, the Situation Assessment Report No. 496. Some Aspects of Farming, 2003 published by the NSSO Reveals that only 8% of the farmers at the all-India level had heard of the WTO and had some idea of its objectives and activities. Higher awareness about WTO was among farmers in Kerala [44%], Punjab [23%], Haryana, Tamil Nadu and West Bengal [12% each].

3.1.35 Another aspect, which impacts the well being and future prospects of the farmers and their families, is the availability of essential facilities in the villages. The NSS Report No.487 on Village Facilities, July-December, 2002 based on a sample of 4646 villages revealed in Table 4.

Table 4: Facilities in Villages

<table>
<thead>
<tr>
<th>Nature of facility</th>
<th>Percentage of villages having the facility</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary school</td>
<td>72</td>
</tr>
<tr>
<td>Pre-Primary School</td>
<td>66</td>
</tr>
<tr>
<td>Medicine shop</td>
<td>10</td>
</tr>
<tr>

<td>Tap water</td>
<td>18</td>
</tr>
<tr>
<td>Access to electricity</td>
<td>75</td>
</tr>
<tr>
<td>Any type of drainage system</td>
<td>30</td>
</tr>
</tbody>
</table>

3.1.36 The above data reveals that a substantial number of villages did not have the basic facility of tap water, electricity, medical attention/availability of medicines, primary school, drainage and postal facilities. Availability of improved seeds, pesticides etc. also posed problems. Almost 24% of the farmers had to travel more than 10km for improved seeds and 21% of the farmers had to travel more than 10km for pesticides. Even for veterinary services about 15% farmers had to travel more than 15km. On all India basis
only 18%, 19% and 24% farmers respectively reported availability of improved seeds, pesticides and veterinary services in their villages. Absence of these facilities, a famine of jobs/livehood opportunities in the rural areas, declining profitability of agriculture, small holdings generating low surplus and increasing disparity between per capita farm and non-farm income is making farming rather unattractive particularly for the youth. Retaining educated and trained youth in the rural areas is a serious problem.

**The National Agriculture Policy**

3.1.37 The National Agriculture Policy formulated by the Government of India had observed “Agriculture has also become a relatively under rewarding profession due to generally unfavourable price regime and low value addition, causing abandoning of farming and increasing migration from rural areas. The situation is likely to be exacerbated further in the wake of integration of agriculture trade in global system, unless immediate corrective measures are taken.” The above statement rings the alarm bells as far as the state of the Indian farmer is concerned. The National Agriculture Policy therefore, sought to secure a fair standard of living for the farmers and agriculture workers and their families, discourage migration to the urban areas and face the challenges arising out of economic liberalisation and globalisation. It aimed to attain, over the next two decades:

- A growth rate in excess of 4 per cent per annum in the agriculture sector
- Growth that is based on efficient use of resources and conserve our soil, water and bio-diversity
- Growth with equity, i.e., growth which is widespread across regions and farmers
- Growth that is demand driven and caters to domestic markets and maximizes benefits from exports of agricultural products in the face of challenges arising from economic liberalisation and globalisation
- Growth that is sustainable technologically, environmentally and economically

3.1.38 It is essential to achieve the above aims without loosing sight of the farmer. It is therefore important that a National Policy for Farmers is formulated to guide the planners and policy makers so that the interests of the farmers are kept at centre stage
while achieving the objectives of sustainable high growth rate across regions and farmers and deriving benefits from economic liberalisation and globalisation under the National Agriculture Policy.

3.1.39 The National Policy on Agriculture has expressed concern about the agricultural workers and their families. The landless constitute about 11.24% of the rural households in India and their livelihood is primarily related to agriculture. A substantial percentage of these fall in the category of poor\(^7\). The urgency to improve their economic well being cannot be overemphasized. Exclusion of rural landless or coastal fisherman/fisher women from the coverage of the policy for farmers would make it rather restrictive. The National Policy for Farmers needs therefore to cover all farmers, landless agricultural labourers, sharecroppers, tenants, fishermen/fisherwomen, poultry/other animal husbandry farmers, bee keepers, others doing vermiculture, sericulture etc. Certain aspects of the definition of ‘farmers’ to clarify the coverage are discussed at Annexure II.
Current Agricultural Scenario:
Assessment by Union Planning Commission

1. Growth Rate

- GDP growth in agriculture and allied sectors during the first three years of the Tenth Plan averages only 1 percent per annum, in contrast to the Tenth Plan target of 4 percent.

- The share of agriculture and allied sectors was 3.9% of the total Tenth Plan outlay, as against 4.9% in the Ninth Plan. The total share of agriculture, irrigation and rural development stood reduced from 20.1% in the Ninth Plan to 18.7% in the Tenth Plan.

- Tenth Plan expenditure of the Ministry of Agriculture during 2002-03 and 2003-04 was 27% of the total Tenth Plan outlay.

2. National Accounts

- Growth rates of livestock and crop output have averaged about 3.6% and 1.1% per annum, respectively after 1996-97, down from 4.5% to 3.1% during 1980-97.

- Within the crop sector, only fruits and vegetables grew at over 2.5% per annum. The output of remaining crops fell below 0.5% per annum after 1996-97 as compared to over 3% earlier.

- Growth of input use in agriculture decelerated after 1996-97, to about 2% per annum from over 2.5% during 1980-97.

- After 1997-98, output prices began to fall relative to input prices.

---

7 IARI-FAO/RAP study [2001] based of 50th NSS round (1993-94) quoted in India 2020 Report of the Planning Commission shows that 54% of the landless were poor.
• Part of the deceleration in agricultural growth can, therefore be attributed to lower profitability leading to a slow increase in input use. **Growth of input productivity became negligible after 1996-97.**

• During 1997-2002, agricultural prices declined **relative to prices not only of inputs but also non-food consumer goods.** Purchasing power of agriculture incomes decelerated more than GDP at constant prices. **Real farm incomes showed no per capita growth after 1996-97.**

• Real per capita food consumption declined after 1998-99, despite fall in relative food prices. **Per capita consumption declined absolutely in case of cereals, pulses and edible oils.** The growth rate in the consumption of fruits, vegetables and milk also declined.

• Input use and productivity growth decelerated from the 9th Plan onwards. **This was accompanied by low demand growth and higher farm income variability.**

### 3. Crop Production

• The Tenth Plan foodgrains target is 230 million tones in 2006-07. **The production was 212.9 million tones in 2001-02 and since then it has been declining.**

• Trend of rice and wheat production was less than population growth by the end of the 9th Plan. **Yield growth throughout the 1990s was about 1% per annum, as against 3% during the 1980s.** Large exports at below domestic prices and subsequent poor monsoons have now reduced the stocks to a low level.

• Yield growth in coarse cereals was about 2% per annum throughout the 1990s, mainly **because of maize**
• A Technology Mission in Pulses has been in existence since the early 1990s. Pulses yields have stagnated and the area under cultivation has also shrunk. A sharp increase in imports of pulses has further reduced incentives for home production.

• Oil Seeds Technology Mission started in 1986. There was a substantial expansion of area, yield and production till the mid 1990s. The production went up to 24.4 million tones in 1996-97. The production was 25.1 million tones in 2003-04, but growth continues to be negligible.

• Imports of edible oils, was less than 10% of domestic production till 1994-95. Now the volume of imports equals domestic production.

• There is an urgent need to review the work of the Technology Mission on Oilseeds and Pulses, since the mission mode approach to project formulation and implementation should yield the anticipated outputs.

• Cotton Production has been good during 2004-05, but yield and quality are still poor. The Technology Mission on Cotton needs to promote a symphony approach, linking the cotton producers and the textile industry in a symbiotic manner.

• Sugarcane yield has been either stagnating or declining – recovery of sugar from cane has not increased.

• In fruits and vegetables, there has been no increase in yield. Vegetable yields are declining. Output increase is entirely through area expansion. The National Horticulture Mission will have to concentrate on increasing yield and quality. Post-harvest processing and management need urgent attention. The National Horticulture Board needs careful restructuring and revitalization.
4. Livestock and Fish Production

- Milk and egg production has decelerated. There is, however, an increase in the number of crossbred cattle and poultry since 1997. Feed, Fodder and marketing need attention.

- Fish production is growing at a rate of 4% p.a. and the production was 6.4 million tones in 2003-04.

5. Overall Trends

- Almost every sector experienced lower growth after 1996-97. Even in the excellent monsoon year of 2003-04, per capita output was less, except in horticulture.

- Food consumption has stagnated since the beginning of the 9th Plan. National Accounts data show that real per capita consumption of cereals, pulses, edible oils, sugar, milk, fruits and vegetables was lower in 2003-04 than in 1998-99.

- Overall employment growth has been very slow. Real agricultural incomes have been stagnating or declining.

- Agriculture will progress only if demand (both home consumption and export) increases. Consumption should be increased through both nutrition intervention programmes and through accelerated non-farm employment.

- Cost of production should be reduced through enhanced factor productivity. The average fertilizer response of food grain output to NPK fertilization works out to 7.8 kg grain per kg NPK. This is a very low return. How can we become globally competitive if our factor productivity is both low and declining?
• Imports of pulses and oilseeds are growing. Import of pulses, which used to vary in the range of 3 to 6 lakh tonnes in the 1990s surged to over 2 million tones in 2001-02 and has remained at that level since then. Imports of edible oils increased from 1 million tonne in 1995-96 to over 4 million tonnes in 1999-2000. It is now ranging in the order of 4.2 to 5.3 million tones per year accounting for about half of domestic consumption.

• Sustainability of food production is threatened by depletion and pollution of the aquifer, soil health degradation, failure of research, extension and input supply systems and declining investment in the farm sector. In addition to being a gamble in the monsoon, farming is becoming increasingly a gamble in the market. “The fatigue of the green revolution” is due to both ecological damage and technology fatigue.

• India today has the largest number of under-nourished children, women and men in the world. Maternal and foetal under-nutrition is resulting in low birth weight babies. Such LBW children are handicapped at birth in brain development, the cruelest form of inequity. Yet, we often hear glib talks about India becoming a Knowledge Superpower. Unless there is widespread realization among political leaders and policy makers that we are on the threshold of an unprecedented human tragedy, we will have to revert once again to the “begging bowl” phase of our agricultural evolution. Also, where hunger rules, peace will not prevail.

Professor M S Swaminathan, 2005, “Science and Technology for Bharat Nirman”, Extract from Presidential Address at 12th General Body Meeting of National Academy of Agricultural Sciences, New Delhi, June 5, 2005
FARMER - SOME DEFINITIONAL ISSUES

Farmers in local languages in India are referred as Kisans, Krishaks, Roytus, Chasis etc. The term farmer includes those who cultivate land and also the sharecroppers/tenants and the agricultural labourers whose incomes come from agricultural operations and activities related/ allied to agriculture. However, the National Sample Survey Organisation [NSSO] defines a farmer as a person who operates some land [owned or taken on lease or otherwise possessed] and is engaged in the agricultural activities during the last 365 days. If either of the above requirements of the definition are not satisfied, the person is not treated as a farmer. Thus the person engaged in agricultural and /or allied activities but not operating a piece of land is not considered as farmers. In other words the agricultural labourers, coastal fishermen, rural artisans and other persons providing agricultural services are not classified as farmers.

2. A plot of land is considered to be owned by a person if the right of permanent heritable possession with or without the right of transfer of title, is vested in him/her. Land held in owner-like possession under long-term lease or assignment is also considered as land owned. The land held as Pattadars, Bhumidars, Bhumiswami, Rayat Sithibans is also considered as land owned as is land taken on lease. Land held under special conditions such that the holder does not possess the title of ownership but the right for long term possession of land [for example land possessed under perpetual lease, hereditary tenure, long-term lease for 30 years or more] is considered as being held under owner like possession. In the States where land reform legislations have provided for full proprietorship to rest with tenants, they are considered as having owner like possession, even if they have not paid the full compensation. Similarly, plot of land possessed by a tribal in accordance with the traditional tribal rights from local chieftains or village /district council or land occupied by a tenant for which the right of ownership vests with the community is considered under owner like possession.
3. The NSSO definition emphasises on two aspects i.e., operation on some land owned, leased or otherwise possessed and secondly engagement in agricultural activities. The agricultural activities are understood to mean cultivation of field and horticultural crops, growing of trees/plants such as rubber, coffee, cashew, coconut, pepper, tea, etc. animal husbandry, fisheries, bee keeping, vermiculture, sericulture etc. However as we are aiming to prepare a draft Kisan Policy, it would be necessary to give a broader coverage to the term farmer. It may therefore be appropriate to cover all those who are engaged in agricultural activities as defined above irrespective whether they own, have leased in or possess some land. This would enable us to include the farmers as defined by NSSO as also the agricultural labourers and coastal fisherman etc. Excluding the landless agricultural labourers who form 11.24 of the rural households and primarily earn their livelihood from agricultural operations would be rather restrictive. Similarly excluding coastal fishermen but including other fisherman who carry out fisheries on their own pond/fields etc. will also not be appropriate for the purpose of preparation of Kisan Policy.

4. Farmers so defined would represent landless agricultural labourers, sharecroppers, tenants, small and marginal cultivators, other farmers, tribal farmers, fishermen/ fisherwomen, poultry/other animal husbandry and pastoral farmers, bee keepers, others doing vermiculture, sericulture etc.
CHAPTER 3.2

GUIDING PRINCIPLES UNDERLYING THE DRAFT NATIONAL POLICY FOR FARMERS

LAND POLICY

3.2.1.0 Introduction

3.2.1.1 Land is the most fundamental requirement for the very survival of the humankind. This finite resource is the most dynamically used agricultural resource for livelihood security. Its quality, quantity and availability in the market-driven setting are hence the most important elements of agro-ecological, socio-economic and environmental security of the nation. Land is not only an economic asset but also has enormous social, psychological and emotional relevance. Rights and access to land are thus fundamental to help empower the poor to adjust to the challenges posed from time to time, such as technology revolution and globalisation in recent years.

3.2.1.2 Secure rights to land are also a basis for shelter, for access to services and for civic and political participation. They are also a source of financial security, as collateral to raise credit or as a transferable asset that can be sold, rented out, mortgaged, loaned or bequeathed. Moreover, secure access to land creates incentives for the user to invest labour and other resources in it, so as to maintain or enhance its value and sustain its productivity, and to access social and economic development opportunities. Several studies have documented a positive relationship between equitably distributed land and economic growth as well as social cohesion. Facilitating land access for poorer groups and protecting their land rights, within the context of the rule of law, enables people to enjoy shelter, food and security in an increasingly competitive environment. This is particularly so where off-farm employment opportunities are limited.

3.2.1.3 Increasing demand for the fixed supply of land typically translates into higher prices. Control over this resource is often central to national and local political
power. As competition for land increases, those with weak rights tend to be cast aside, as they are unable effectively to assert their claims. Land rights once lost are difficult to re-establish. Tribal people may find that the lands on which their livelihoods depend have been sold off for mining developments, ostensibly bringing jobs and development to the local area (and the poor gets still poorer). Land policy must have explicit proactive rehabilitation provisions and measures.

3.2.1.4 Land policy in India has evolved over hundreds of years in line with the evolving agrarian and urban societies and political and governance patterns and occupied centre stage in India’s policy debate. In Independent India, the very First Five-Year Plan had spelt out country’s’ land policy, which aimed to reduce disparities in income and wealth, to eliminate exploitation and to provide security to tenants, as well as to achieve social transformation through equality of status and an opportunity for different sections of the population to participate in development initiatives. The policy has undergone broadly four phases. The first phase (1950-1972) consisted of land reforms, including abolition of the intermediaries, tenancy reform which has provision also for enabling tenants to acquire ownership rights and the distribution of land using land ceiling. The second phase (1972-85) shifted attention to bringing uncultivated land under cultivation. The third phase (1985-95) increased attention to watershed management and a Waste Land Development Agency was established. The fourth and current phase (beyond 1995) is giving greater attention to land administration, rental markets, land records and land titles. All the Five Year Plans since 1951 have addressed land policy and reforms (Annexure I), serving as a process of overall development.

3.2.1.5 Following the Land Ceiling Act, the surplus land was distributed to landless and near-landless poor farmers and tenurial rights to almost 10 million ha of land were transferred during the 1970s and 1980s - more than three times what was involved in the well-known land reforms of Japan, Korea and other East Asian countries. Box I gives details of the major achievements steered by the Ministry of Rural Development, Government of India as well as the States in the field of land reforms from the beginning of the First Five Year Plan till the Tenth Five Year Plan.
Box I. Land Reform Achievements

- Intermediaries have been abolished over 6.0 million hectares of land and ownership rights have been granted to 20 million tillers.
- 12.42 million tenants have got their rights protected over an area of 6.25 million hectares of land;
- An area of 2.12 million hectares of ceiling surplus land has been distributed to 5.67 million rural poor, 51% of which constitute Scheduled Castes/Scheduled Tribes.
- An area of 5.90 million hectares of Government wastelands and 0.87 million hectares of Bhoodan land have also been distributed among the eligible rural poor;
- 0.17 million hectares of alienated land has been restored to Scheduled Tribes land owners;
- An area of 65.34 million hectares has been consolidated in the country;
- 582 districts, 201 Sub-Divisions and 3142 tehsils / taluks have been covered under the Computerization of Land Records (CLR) programme, out of which 1553 tehsils wherein computerized copies of RoR are being issued to land owners. For this purpose a financial assistance of Rs. 3005.15 million has been released to States/UTs.
- Under the Scheme of Strengthening of Revenue Administration and Updating of Land Records, an amount of Rs. 2659.74 million as Central share has been provided to States/UTs for undertaking survey operations and updating of land records and creating infrastructure facilities or revenue administration.

Source: Annual Report, Ministry of Rural Development, Government of India, 2004-05

3.2.1.6 The above achievements notwithstanding and sporadic marginal impact on poverty and inequity reduction, the objectives of the land reforms, as described in the following Section, have only partially been met and in most cases the beneficiaries did not receive full ownership. In the meantime, the land reform activities have tapered off and the task remains eminently unfinished. On the other hand, despite the restrictions and high cost of transactions in the land rental markets, more than 15 million households are participating in rental markets, and concealed tenancy is not uncommon. Moreover, the area-development programmes such as watershed programmes and management of degraded lands have not proceeded satisfactorily. Land policy must address structural issues that, in the longer term, need to be addressed in order to ensure that the economic opportunities opened by other policy changes will benefit the broad majority of the poor.

3.2.1.7 Obviously, the old and ongoing land reform and land development programmes should be revisited and revitalised in context of the ground realities and
the various new developments such as globalisation, liberalisation and the accent on diversification, off-farm employment, public-private partnership, revival of rural cooperatives, group farming for enhanced scale of economy and on competitiveness. In doing so, the farmer must be kept in the centre of the development process and the interest of the small and marginal farmers and the landless poor should be actively promoted. Land affairs and agriculture being State subjects and matters of great socio-economic and political importance (and sensitivity), the Central and State Governments should synergise their efforts to empower the landless and near-landless. The States should be given due financial, legal and technical supports to develop necessary Acts and Laws, legal instruments, trained human resources and institutional mechanisms to implement the policy and reforms and to monitor their impact on poverty reduction, economic development and agro-ecological security.

3.2.2.0 Ground Realities

3.2.2.1 Summarised below are the major outcomes and trends of the land reforms in the past, specifically in terms of land distribution, holding size, rental market and land development.

- In the early years of the post-Independence era, four important components of land reform comprised: (i) the abolition of intermediaries, (ii) tenancy reforms, (iii) fixing ceiling on land holdings and (iv) consolidation of land holdings. By 1960, the whole process of legal enactment of the abolition of intermediaries was completed. The other land reforms, namely, consolidation of holdings and implementation of land ceilings, had mixed outcomes; the latter, however, has halted increase in the concentration of land in fewer hands. Further, the phenomenon of absentee landlords was weakened and there was greater convergence of ownership and management. A strong middle peasantry emerged which had largely anchored the Green Revolution.
- Land base of marginal and near-landless households has not improved much over time; at best, the percolation of gains from land redistribution has stopped at the middle level of peasantry. Only 40% of the land out of the
totally distributed has been given to the Scheduled Castes (SCs) and Scheduled Tribes (STs). Dispossession of the land allotted to Dalits is not uncommon. Lakhs of acres of land are still with the court for dispute settlement since the landowners or ryots have refused to hand over the land to the Dalits. In addition, the government has abolished the settlement courts.

- The politics of land distribution has been changing which is reflected in the changed power structure. In the earlier times, the SCs and STs occupied the primacy in terms of land distribution. On paper it is still continuing but ever since the backward classes have gained enhanced political economic concessions available land is mostly going to the OBCs than to the SCs and STs.

- The huge proliferation of extremely small and economically non-viable holdings is emerging as a major agrarian handicap for livelihood improvement of majority poor smallholders. Nearly 66 percent of the farming households own small holdings of less than 1 ha. Simultaneous occurrence of diversion of agricultural land to non-agricultural uses (net outflow) and under-utilization of available agricultural land (current fallows) has diminished availability of land for cultivation and has shrunk common property resources (CPRs).

- The quality of land has deteriorated over years, often linked with poverty and compulsive “mining” of the land. But, often the damage caused by rich farmers is much more widespread as compared to that by smallholders. Small farmers utilise their lands more fully compared to large ones. SCs and STs have greater underutilization of land because of their poor access to technology, irrigation, inputs and credit.

- Despite multi ministerial institutional interventions to strengthen integrated watershed management, involving also the landless and land poor to manage the watersheds, alongwith the encouragement of the role of NGOs and higher levels of peoples’ participation, the performance of majority of the watersheds is unsatisfactory and the efforts are often fragmented, nonparticipatory and duplicative.
• Despite ban on leasing in and leasing out, the amount of land actually leased in is high. Agricultural technology, encompassing seed, fertilizer, irrigation and mechanization has impacted extent of tenancy and the lease market. The extent of sharecropping has greatly declined, whereas fixed rent tenancy, including fixed share of produce, has increased. Reverse tenancy exists but is not of much consequence in most States; often holders of not very different farm-size categories dominate the lease market. Concealed tenancy is also prevalent. The land lease market is mostly functioning on the principle of demand supply balance.

• Although a good beginning has been made in some of the States, through projects such as “Bhoomi” in Karnataka, “Dharni” in Goa, “Tamil Niloin” in Tamil Nadu and “e-Dhara” in Gujarat, but in majority of the States, land record and clear status of land titles and rights are generally missing and nonexistent. Computerisation of such records, a prerequisite for implementation of reforms, has thus yet to show its impact on a wide scale and “the revenue administration in the country lacks vision, dynamism, a holistic view of land management by the State and hardly it takes any intrinsic momentum.”

3.2.3.0 Impact of Land Policy

3.2.3.1 India's land policy interventions during the last five decades can be assessed based on their impact on various parameters, including alleviation of poverty, conflict management and equity, sustainable economic development, environmental impact, and production efficiency. Despite the various shortcomings as described in the above Section II, the land policy interventions have had varying positive impacts across the States, depending in large part on the agrarian situation and the extent to which a given policy was implemented (Annexure III). Poverty alleviation could be considerably impacted by the first three phases of land reform, but the Drought Prone Area Development (DPAP) and Desert Area Development Programme (DADP) have made little inroad. Similar results are seen in respect of conflict management and equity, but a significant change was recorded in this area.
because of the computerization of land records. DADP, DPAP and Wasteland Development Programmes could impact environmental management significantly. Similarly, these could influence sustainable growth in some pockets. The major contribution to sustainable growth came, however, from the abolition of intermediaries and from the ceiling on land holdings, which together have put a pressure on economic use of resources. While production efficiency is not a direct derivative of land policy, its components can help. The abolition of intermediaries, land ceilings and the consolidation of holdings (wherever it could be done) have certainly contributed. But, the boost was not large enough to create significant spill over impact in non–farm sector and overall rural income. The Watershed Development Programme has been one of the important land policy interventions in the recent past but its impact on poverty alleviation, production efficiency, conflict management and environmental management could have been better.

3.2.4.0 Major Issues

- Ever shrinking land availability and sub-division of holdings due to: (i) conversion of agricultural land to non-agricultural uses and diminution of Common Property Resources, (ii) rising pace of urbanisation, (iii) increasing demographic pressure and (iv) lack of non-farm employment.
- Unequal and inadequate access to land adversely impacting the production base of cultivating households at the bottom of the farm size hierarchy, especially when over 80 percent of the Indian farmers are small and marginal; alienation of land allotted to poor and Dalits has also not been uncommon.
- Unplanned land utilization – underutilization, excessive mining, faulty exploitation causing low productivity and production and exacerbating unsustainability and inequity (defunct Land Use Boards); outflow of land and increased current fallows have hampered availability of land for cultivation.
- Restrictive land markets, anomalies and loopholes in land tenancy laws, concealed tenancy, extremely poor land records and their inaccessibility, lack of congruence among Common Property Rights, Women’s Land Rights, Customary Rights of Adivasis / Tribals and Dalit Land Rights, etc; Limited
role of PRIs and Gramsabhas; lack of structural change in agrarian system to operationalise land reforms.

- Changes have taken place in the basis of land reform policy from equity orientation to market orientation in a systematic manner in recent years. The market forces and speculations have further distorted land entitlement of the poor. Policy dialogues have been inconsistent in providing concrete approaches and actions to ensure inclusive economic development and access to production resources.

- Lack of sustained commitment from government and development agencies and disconnect among the concerned Ministries generally adopting short-term project based land use decisions are not only hurting the resources, but are often anti-poor. For instance, new Industrial Policies in some States are proving draconian for land rights of poor and should be harmonised with agriculture and land policies.

3.2.5.0 Policy Implications and Actions

Access to Land, Poverty Reduction and Agricultural Development

3.2.5.1 Rural poverty is strongly associated with poor access to land, either in the form of landlessness or because of insecure and contested land rights. Economic analyses have long recognized the importance of secure property rights for growth, and therefore for the poverty reduction which growth can bring. Increased land access for the poor can also bring direct benefits of poverty alleviation, not least by contributing directly to increased household food security. In an agriculturally important country like India, where alternative employment opportunities are limited, access to land is a fundamental means whereby the poor can ensure household food supplies and generate income. This applies both to societies in which subsistence agriculture is prevalent, where access to land is the \textit{sine qua non} of household food security, and to societies where agriculture is more market-oriented, in which family farming provides a principal source of employment generating the income with which to buy food and to ensure livelihood security.
3.2.5.2 The relationship between access to land and poverty reduction cannot be seen in isolation from broader agricultural and economic policy. Equally, these issues are intimately connected with rural development policies and environmental outcomes. The distribution of land rights and opportunities for access to land will have implications for the distribution of wealth, rates of economic growth and the incidence of poverty, and the shape and direction of agricultural development will affect the incomes and returns from different types of farming activity, the value of land and demands for owning or for accessing land resources. The incentives and tenure structures that largely determine how land is used will profoundly affect environmental impacts and sustainability.

3.2.5.3 Despite past and ongoing efforts of reducing the pressure on agricultural lands and lessening of the crowding in and overdependence on agriculture, in the absence of viable alternative employment opportunities, nearly 70% of the Indian population, a huge number of nearly 700 million people comprising nearly 125 million families, continue to be engaged in agriculture and dependent on agricultural land for their livelihood. Therefore, land policy which must promote inclusiveness and enhanced and sustained agricultural productivity and income should be transparently and effectively pursued. In the meantime, creation of off-farm and non-farm employment should be vigorously promoted. Provision should also be made to exit farming in a phased and confident manner, if desired and warranted.

3.2.5.4 Small farm family farming remains the backbone of rural livelihood, and has been shown to be dynamic, responsive to change, and an important source of investment in agriculture. However, given the context of increasingly globalised markets, sustaining rural livelihoods for smallholder farmers will depend on their continued modernization, with support from policy and resources to strengthen capacity and access to markets. Smallholders must have their property rights secured and protected. This would provide collateral to obtain seasonal or longer-term credit for investment in productivity-enhancing changes or selection of an optimal time to sell the produce; enable them to safely rent out part of the land or rent in other land;
or in the last resort provide the option to sell their land and harness the proceeds to develop new livelihood opportunities.

3.2.5.5 Some critics argue that smallholder farming is inefficient and that the rural poor would be better off leaving the land and finding employment in the modern economy whether in commercial farms or in the non-farm sector (Box II). But, considering the ground socio-political realities and continued high dependence on agriculture, lack of alternative employment, and the untapped potential of small farms, “corporatisation” of agriculture is not desirable from any angle. Farmer-friendly contract farming, Small Farmers Estates and other such group mechanisms like National Dairy Development Board (NDDB) milk cooperatives and sugarcane cooperatives in Maharashtra are the viable alternatives to provide desired economies of scale as well as end-to-end linkages. Felda Scheme in Malaysia and Rubber Board in Thailand are success stories of promotion of oil palm and rubber on small holdings and processing in centralized high – tech processing plants in a Nucleus - Estate system, which could be adapted in India.

3.2.5.6 The latest (59th) Round of NSSO released in 2005 revealed that, given a viable alternative, 40 percent of the farmers would like to quit farming. This is not to be considered something highly unusual as most socio-economic transformations have witnessed the declining contribution of and dependence on agriculture and rising contribution of manufacturing (industries) and services sectors to national economies. However, in India the trend is “unusual” in the sense that while the contribution of agricultural GDP to total GDP is now only around 20 percent, the dependence on agriculture for employment and livelihood security continues to be extremely high, around 60 percent, thus adversely affecting the per caput income of agricultural population and further exacerbating the rural-urban income and livelihood gaps (the Bharat-India divide). The only way out of this worsening agrarian economy is to enhance productivity and income of small farms and farmers and diversify employment (rural) opportunities by strengthening production-processing-value addition-marketing-consumer chain under the leadership and control of the farmer and the farming community. The Amul Model of cooperative of the National Dairy
Development Board should be widely adopted in other agricultural subsectors (Box III) as well.

Box II. Smallholders Versus Large Farms

There has been long-standing debate about farm size and productivity. Some argue that the era of the smallholder farmer is over, and that for reasons of efficiency, small farms should be consolidated into fewer large holdings, allowing for economies of scale and increased mechanization. They point on the one hand to impoverished peasant farmers on the margins of existence with little ability to generate a surplus for investment in the farm enterprise and limited capacity to adopt new technology, and on the other to profitable large farms, accessing world markets, and providing employment and good wages to the local rural workforce. Others refute such arguments and note that for many crops there are few if any economies of scale in agricultural production. They point on the one hand to dynamic smallholder production, in which innovation and investment are very evident, as people adapt to new market opportunities and changing environmental conditions, and on the other hand to inefficient, extensive large farms with few workers, low wages and poor productivity.

There is ample evidence to support either case, depending on the type of crop, the policy context, and forms of support available to different kinds of farmer. Small farms are generally family-run, may be subsistence-based or market-oriented, using few or many external inputs, working manually or with machinery, and use the land extensively or intensively. Large farms are generally market-oriented, may be family-run like small farms or corporate, and use few if any or many labourers. Both small and large farms may be resource-poor or rich, use largely manual methods or machinery, and use the land extensively or intensively. Because of this great variation in farm types any statements on the relative merits of small versus large farms can only be relevant within specific social, economic and biophysical environments.

Scale economies may be achieved by mechanization in crops such as sugarcane, some cereals and soya, for example, while perennial crops such as rubber, fruit and vegetables tend to do better under intensive production with a significant proportion of manual input. In the absence of economies of scale, small farms may be more efficient than large ones because of the favourable incentive structure in selfemployed farming and the significant transaction and monitoring costs associated with hired labour. In Indonesia, for example, some 80 percent of rubber and resin production and 95 percent of fruits are produced in smallholders tree gardens. But both smallholder and plantation rubber may be tapped by experts, owners or labourers with a direct interest in the sustained latex quality and productivity of the trees in their care, and limited need of supervision.

Even where there may be few economies of scale in production itself, there are increasing upstream and downstream economies of scale related to access to inputs and markets. Purchasers of commodities prefer dealing with a few larger suppliers because of the transaction costs associated with handling produce from a large number of individual smallholders, relegating these to less profitable local market outlets. Such local markets are also under threat where local produce is in competition with food grains, often subsidized, from countries with surplus stocks. However, groups of smallholders may also organize themselves to jointly store, grade and sell their produce to gain access to large buyers.

Box III. Empower the Farmer

India's heart and soul resides in her villages. Unless rural India becomes socially and economically free, there will be no true progress. The success of our democracy rests with the rural poor and if we want the rural economy to be liberalised, we must empower our farmers. One of the best ways of achieving this is through co-operatives. Co-operatives comprise a special category of business organisations because their raison d'être is not profits for distant shareholders, but returns to farmers who invest in land and animals.

The merit of the co-operative ideology is the co-ordination and balancing of fundamental principles of equality, democratic control and equality in institutions, and practices to maximise social welfare. It is my firm and unshakeable belief that the entire value chain from procurement to marketing is the sole and exclusive domain of the farmer. The moment the farmer loses or dilutes his right over it, being a small producer, he becomes nothing better than a contract labourer. Value addition in the procurement and processing functions is realised only at the time of marketing. If marketing is not in the hands of farmers' organisations, they will not get a good realisation for their efforts as marketing is the only revenue earning part of the value chain. There is no better way of helping our nation's producers to become productive members of our society.

A case in point is co-operative dairying, based on the Amul model where procurement, processing and marketing is in the hands of the farmers. A massive network, it involves collecting milk from more than 12 million farmers, testing, grading and transporting twice a day from 1,00,000 villages over 10,000 routes to about 180 dairy plants. It is later followed by processing, packing, and sending the milk to the market in almost 800 big and small towns every single day of the year — definitely no mean task in marketing. Delivering wholesome nutrition to the consumers at the most reasonable prices seen anywhere in the world, while transferring the bulk of the value realised back to the farmer is a feat both in marketing as well as in social development.

Co-operatives must be headed by professionals armed with tenures long enough to achieve meaningful changes. An officer deputed with ad hoc powers and subject to sudden transfers can hardly be expected to measure up to the task. As a corollary, no political consideration must colour the policies, objectives, strategies and functioning of a co-operative.

Land Reform an Unfinished Vital Agenda

3.2.5.7 Both the internal and the external environment of the Indian economy has changed since the first Five Year Plan which emphasized the importance of land reforms. The reform component has been put on the back burner. Questions have been arising as to how important is the ongoing land reform in the present context in which economic policies are driven more by market oriented reforms. There are three
compelling reasons to believe that land reform is even more important today than in the past:

- Land reform is important because the structure of the Indian economy is still dominated by agriculture which provides nearly 60 percent of employment and almost a one-fifth of the GDP. Moreover, hard core poverty still persists extensively in rural areas on an extensive scale which market forces are incapable of addressing. Therefore, both for employment generation and for assault on poverty the issue of land reform has to be faced squarely.

- It is stated objective of the UPA Government that the National Rural Employment Guarantee Programme (NREGP) can be implemented properly only through a decentralized Panchayati Raj system. This scheme can only be successful in reaching the poor if the Panchayats become less dominated by the landed and privileged rural elites. This requires a successful system of land reforms because inequality in land distribution is very often at the bottom of other forms of social discrimination and domination based on gender, caste, minority and tribal affiliation. This requires a new vision of land reforms which would intertwin it with the NREGP. Land reform should also be linked with Bharat Nirman.

- Democratic functioning of our institutions and successful decentralization of Panchayati Raj system is a way forward for the deepening of Indian democracy. This would be feasible only if land reform and significant changes in existing land relations can be brought about to make the pattern of growth more inclusive. Outflow of productive agricultural land, particularly in areas endowed with a strong infrastructural base for agriculture, must be checked through appropriate legal reforms. The decline in CPR should be stopped through suitable regulatory interventions; the legal bindings from the top should be intertwined with political awakening from below. PRIs and other grassroot institutions should play an important role in this direction and should be duly strengthened for the purpose.
3.2.5.8 In view of the above, land reform should be viewed in the entire context of agrarian reforms as ably summed up by D. Bandyopadhyay, “The basic issue in rural poverty turns out to be land reforms, in a sense little more than that resource reform. Resource reform would include land reform per se, community control over water and common property resources, right of forest dwellers and forest based self employed occupations and large measure of gender equity and intergenerational justice. Resource reform is primarily about changing relationships. First, it aims at changing access to land and tenurial relationship. Second, it aims at changing the culture of the exclusion so that the poor can gain access to credit, technology, market and other productive support services. Farmers’ suicides in our country only highlight the extent and depth of this culture of exclusion. Third, it aims for the poor to be active participants in the development of policies and programmes affecting their communities and livelihood. Thus Resource Reform would mean – secure access to land/water and secure and fair tenurial relationship plus (+) support services plus (+) participation.”

Land to the Landless and Land Redistribution

3.2.5.9 In general, redistributive land reforms have been motivated by three related but distinct objectives:

- To achieve more equitable access to land, so as to reduce poverty and landlessness in rural areas;
- To improve social justice by shifting the balance between different groups in the ownership and control of land and restoring alienated land rights;
- To promote rural development by raising agricultural productivity and creating a class of productive smallholder farmers.

3.2.5.10 These objectives have frequently been combined, but they may also conflict, leading to different types of land reform, targeting the very poor, or alternatively, commercially viable farmers. In particular, whether improvements in equity and social justice also enhance productivity and land use efficiency may depend on the agricultural development model adopted and the wider market context.
Researchers have documented a positive relationship between more equitably distributed land and economic growth. Experience from several East Asian countries (South Korea, Taiwan) shows clearly how a reform delivering more equitable land distribution is fundamental to create sustained economic development, by sweeping away conservative and unproductive land-owning classes, promoting farm modernization, and boosting rural purchasing power and domestic demand to support a growing and competitive industrial sector.

3.2.5.11 The experience of Taiwan and South Korea, where successful land redistribution took place after the end of a major war and under the communist threat, and in the Indian states of Kerala and West Bengal, where land reforms were key elements in egalitarian social change, shows that the success of a land reform programme ultimately depends upon strong political power allied to land reform movements seeking to change the land distribution of the country, and challenging resistance by landed interests.

3.2.5.12 The Government should make all out effort to improve poor people’s access to land, as it is crucial for poverty alleviation in some areas. While effort should be made to effectively implement the existing ceiling laws and also to redistribute the ceiling surplus land among landless and semi-landless poor, government should also purchase land from the market and distribute among the land-poor, as being done by some State governments, like Andhra Pradesh (Box IV). The large amount of surplus land involved in litigation must be got freed through suitable legislative intervention and distributed to the landless or the near landless households.

3.2.5.13 Government should allocate homestead cum garden plot of reasonable size to all landless families in rural areas, based on either available government land or purchasing land from the market. This will enable the poor landless families to construct house if needed on their own land and also grow some fruit trees, vegetables, rear cows, poultry birds etc. and earn supplementary income. This will also significantly improve their food and nutritional security.
3.2.5.14 While allocating a piece of land to the landless is the foremost step for alleviating rural poverty, the process should be followed up by the major agricultural technology sub-system, quality irrigation, credit system, extension system, seed system, fertilizer system, and marketing system. The main concern is improving the economic level and livelihood security of the poor farmer rather than making a landless person merely a landholder. Positive policy of bringing together various kinds of input supports including technology should be undertaken so that the poor could participate in the development process. The rural banks, NABARD and Land Development Banks should be encouraged and duly equipped for delivering credit, technology and marketing supports particularly to the landless, especially SCs and STs.

Box IV. Increasing Access to Land: The Andhra Pradesh Example

Indira Kranthi Patham (IKP), initiated in 1995 and now operational in 846 of the AP’s 1100 mandals, one of the pioneering projects, focuses on the poor women in the State and builds on the State’s strong SHG movement to help the poor to achieve tenure security and physical possession of land and empowers them through institution building and enhanced livelihood security. Committees comprising all stakeholders, including officials from the Revenue Department, are handling the matter at State, District and Sub-district levels, undertaking awareness-raising, data management and access administrative support and oversight and legal aid. These (land) non-purchase activities have put 1.2 lakh acres in the hands of the poor within a short period of 18 months.

The land purchase activities of the project assist the landless or nearly-landless poor to purchase and develop small plots of private land and helps the purchaser to access institutional financing for the purpose. With beneficiaries in the driver’s seat, IKP, in consultation with the SHGs, purchases land as per pre-purchase business plan and by loaning upto Rs. 30,000 per household to purchase either field plots or house-and-garden plots and to obtain resources for developing these plots, thus factoring in also the costs of improvements and technical assistance. The community coordinators identify the perspective SHGs whose members much meet a set of eligibility criteria and through a direct negotiation between buyer and seller the land is purchased at a price not higher than the maximum set by a Mandal Appraisal Committee. Under this component, in 14 districts purchase of over 2100 acres of land are underway.

Accelerated since October, 2004, the IKP, by August, 2005, had distributed (mostly redistributed) 3.25 lakh acres (85% being government land) to 2.4 lakh beneficiary households with full ownership rights, which were not there before. This was possible through close cooperation among IKP functionaries, Gram Sabhas, the Revenue staff and the farmers. Pattas were given exclusively to a large number of women farmers.

104
3.2.5.15 Positive relationship exists between farm size and degree of underutilization of land, but this gets reduced as capital intensity of production goes up. Therefore, land development grants should particularly be directed towards small farmers in the more developed States while such grants in the rainfed regions might aim at benefiting all sections of the farming communities.

**Restoration of Alienated Lands**

3.2.5.16 There continues to be widespread dispossession of Dalits, tribal communities and other poor from their lands which have been legally allotted to them or should have been in their names. However, there is no official estimate of this and information of the villages where there are a large number of cases. As a consequence there can be no systematic effort by the State to restore possession to the rightful owners. It is essential therefore that a survey be undertaken of all the lands for which SC/ST and other BPL families have a legal right. Collection and compilation of data should be undertaken separately for the SC/ST beneficiaries under various land reform measures. This is the most fundamental task which must be taken up in all the States on a priority basis, since it will provide a base for ensuring the restoration of possession on the one hand, and development including investments on the land and improved productivity on the other. This nationwide survey to be taken up in the States may be supported by the Ministry of Rural Development (Department of Land Resources) and could be coordinated by the Revenue Departments of the States and the Collectors/Deputy Commissioners in the districts could, appropriately, undertake this work.

3.2.5.17 State Governments should strengthen their legal and administrative infrastructure to prevent alienation of tribal land and restore the alienated land to tribals along with plans for productive utilization of such land. On the basis of the survey, a drive for restoration of the possession of lands to the Dalits and other poor who have been dispossessed (or never given possession at all) is required to be taken up by the Revenue Departments in the States. This may be commenced, to begin with, in select regions where there are a large number of cases of such dispossession,
and on basis of experience gained, extended to all areas. One Steering Committee should be constituted incorporating the main stakeholders, particularly from the Ministry of Agriculture, Ministry of Rural Development and Ministry of Social Justice and Empowerment to oversee the progress of these issues.

**Tenancy Reforms**

3.2.5.18 Land tenure security refers to the degree of reasonable confidence not to be arbitrarily deprived of the land rights enjoyed or of the economic benefits deriving from them. Land tenure security is a key part of sustainable development, as agribusiness and smallholders alike need secure tenure in order to invest in the land. Yet, in many parts of the country property rights are weak or unclear, undermined by overlapping land claims and intense competition. This situation creates confusion and fosters tenure insecurity, which discourage agricultural investment and enable elites to grab common lands. Efforts to improve land tenure security have traditionally emphasized large-scale individual titling and registration programmes. Individual titles, a long-standing argument runs, would increase the willingness and ability of landholders to invest, by removing disincentives (as landholders would not invest in the land unless they can be reasonably confident that they will not be deprived of it) and by improving access to credit (as titles can be used as collateral). On the basis of these arguments, titling and registration programmes have been implemented over the past decades in many parts of the country. Land titles, when accompanied with other necessary services and inputs have led to higher land values, greater agricultural investment and higher productivity.

3.2.5.19 In India, land tenancy markets appear to work well, but they face legal hurdles in the shape of tenancy legislation originally intended to protect the interests of the poor: as most developed countries have found, such legislation effectively paralyses rental markets. In different Indian States, land legislation ranges from outright prohibition of tenancies to regulating their terms and conditions. However, implementation of this legislation has led to unintended consequences, driving tenancy underground. The creation of permanent rights for tenants and the outlawing
of tenancy has caused landlords to fear losing their land, limited rental opportunities for land-poor households, and led to the under-utilization of cultivable land and to pre-emptive evictions of tenants before the legislation came into force. The prohibition and excessive regulation of land rental markets tends to restrict land access opportunities, and while clear and secure tenancy rights and the elimination of exploitative practices are important, there is a compelling case for the liberalization of restrictions on both fixed rental and share tenancy contracts. Nevertheless, there remains a case for limited and balanced regulation of tenancy in favour of the poor, providing some measures of security of tenure and curbing the potential for exploitative practices of landlords.

3.2.5.20 The main components of tenancy reform included security of tenure, termination of tenancy, resumption for personal cultivation by the landlord, regulation of rent and confirmation of ownership rights, and the following guidelines were communicated by the Government of India to the State governments for incorporation in the State legislation:

- Security of the tenancy to be conferred on the actual cultivator;
- Fair rent to be fixed between 20 and 25 percent of the gross produce;
- Landowners may be permitted to cultivate land for their personal use;
- The surrender of the tenancy rights with mutual consent;
- In respect of some of the area, the landlord-tenant relationship to be ended and the tenant cultivator be brought directly into contact with the State;
- Disabled persons, defence personnel and other such exemptions to be allowed to lease their land;
- The term "personal cultivation" should be clearly defined if landlords are allowed to remove tenants in order to resume cultivation;
- Tenancy records should be corrected and oral tenancies should be abolished.

3.2.5.21 The guidelines have, however, not been followed uniformly. Many States have banned tenancy, some States have banned only old tenancies as the land has been assigned to the tillers and few States have banned new tenancies only. Thus
there is no uniformity of Tenancy Laws across the States and even there are deviations from the national policy on tenancy (Annexure II). Further, in spite of Tenancy Laws enacted by all the States, their implementation has been dismal. Except ‘Operation Barga’ in West Bengal where tenants / share croppers were recorded and tenants were given legal status, most other States have done least in this regard. In most States there is no recording of tenancy and in such cases share cropping becomes exploitative. Similarly, absentee land owners do not rent out land for the fear of losing ownership rights or go for informal leasing to the tenants. This also causes inefficient / poor use of the land. On the other hand, access to land by poor has become difficult due to tough tenancy laws, and sometimes, when in dire need, the poor and marginal landholder can not sale his/her land. Wherever tenancy is recorded, the rent is generally not properly fixed according to law and thus the tenants continue to be exploited. Hence, there is a need to examine the State policies on land tenancy and harmonise them as a national policy barring the most critical provisions to be covered under State- specific Acts.

3.2.5.22 Land reform should benefit the actual cultivators who till the land so that the productivity and growth in the agriculture would increase and subsequently, agricultural development will bring forward rural development and overall economic development. In the present scenario of liberalisation, privatisation and globalisation, the land market and the cropping system will be changing. There are already instances of reverse tenancy, contract farming, corporatisation of land, etc. There is a need to have legislation which legalizes the tenancy as an agreement between the owner and sharecropper and both of them should have a right or freewill to cancel it or anull it anytime. Tenure security is thus a major policy issue. To realize the full benefits that can accrue from rental markets, governments need to ensure that tenure security is adequate to facilitate long term contracts, and eliminate restrictions on the operation of such markets, except under special circumstances.
Legalising Land Leasing

3.2.5.23 To ensure equity, efficiency and feasibility, a regulation, which does not come as a threat to the landlords and will also provide security to the tenant, is necessary so that investment comes in, loans come in and there is an increase in the productivity. There is a tendency among the land owners to keep the land fallow rather than leasing it out as they fear that they may loose their land rights. Leasing in and leasing out of agricultural land should be legally permitted within ceiling limits of various States and both the tenant and the owner should have a guarantee of protection of their interests. This will promote occupational mobility of people as well as efficient utilization of land, labour and other resources.

3.2.5.24 A variety of promising initiatives in land leasing by NGOs to facilitate access to land by the poor have emerged. One of the best documented is the work of the Deccan Development Society in leasing out underutilized private land in Andhra Pradesh for use by Dalit women on a tenancy basis. Despite the need for small-scale land holders to be free to transact land amongst themselves, experience shows that land sales markets are much less effective than land leasing or sharecropping in providing new land access opportunities for the poor. High transaction costs and lack of access to credit limit the ability of the poor to buy land on the market. Distress sales of land by the poor may also occur, with negative equity outcomes. Nevertheless, the ability to transfer land on a freehold or leasehold basis may create incentives for greater investment and enable use of land as collateral in credit markets.

3.2.5.25 Legalised leasing will be a pro-poor move, as majority of the beneficiaries will be small and marginal farmers, hence should be given high priority. Allowing the lease market to function is good for those who want to lease out their tiny nonviable plot to avail of other opportunities as well as for those who want to supplement their tiny holdings to make them viable. Concealed tenancies are neither good for the tenant nor the landlord. Moreover, informal tenants cannot get loans from formal financial institutions. Studies have revealed that some of the farmers committing
suicides were informal tenants who borrowed from moneylenders and could not pay back because of high interest rates. Legalizing leasing will thus also enhance the access of small and marginal tenants to institutional credit. The move will also eliminate the unilateral fixation of land rent. Further, it is hoped that opening the lease market will attract much-needed private investment in agriculture.

Ownership Rights to Land and Use Rights of Land

3.2.5.26 Land reform has two broad dimensions based on ownership rights to land and use rights of land. In so far as the ownership right is concerned, it is increasingly clear that owners at the top-end of the distribution spectrum often do not accept full time agricultural occupation, nor do they derive their income only from agriculture. In several parts of the country, there has been an increasingly perspective shift in ownership patterns towards neogentlemen farmers and non-cultivating households and non-resident farms. Most land purchases are by these groups and in many respects they have the characteristics of erstwhile rentiers. In some parts of India in which Green revolution had an early start (Punjab, Western U.P.) evidence suggests that near landless farmers have rented out their land to join the category of strict landless groups. While top farmers have also lost, the proportion of small to medium farmers has remained stable. The main lesson to be drawn from this is that alternative possibilities of livelihood must be made available for the now landless peasants. The possible lines of action for coming to grips with the situation are:

1. Redefine self-cultivation and residence qualification;
2. Tighten the ceiling laws in following respects:
   - No further relaxation of ceilings, as there is nothing in technical or factor efficiency argument against this;
   - Allotted and alienated land to be restored;
   - Handing over possession of allotted land;
   - Settlement of court cases and allocation of bhoodan/temple lands to be hastened;
   - Benami transactions / power to reopen closed cases;
• Banning exemptions from agricultural ceiling for land converted to non-agricultural use and for corporate farming; and
• Reduction of ceiling limits to Non-resident Indians and for those who are predominantly non-resident and are non-resident farmers.

3.2.5.27 As regards use rights of land, these should be orchestrated to provide greater opportunities for small farmers. With a view to this, following recommendations mostly related to tenancy or use rights are made:
• Make tenancy relationship open, but record them and regulate security and fair rent;
• Provide access to tenants to agricultural services support and institutional credit;
• Stress use rights in CPRs, degraded wastelands/government land etc.;
• Develop a broader perspective of land consolidation and utilization to enable better land use, greater pooling of services, strengthening and monitoring of SHGs, organisation of small farmer estates, and promotion of cooperative mode of cultivation, joint investment in infrastructure, irrigation etc.

Balancing the Interests of Foreign Investors and the Land Rights of Local Users

3.2.5.28 Land and natural resources are an important sector for foreign investment, in agribusiness, forestry, tourism, mining and petroleum. If appropriate conditions are not in place, natural resource-based investment projects may undermine the ability of local communities to access the resources on which they depend for their survival. This may take the form of expropriation of community lands without adequate compensation and proactive rehabilitation. Investors may also be granted exploitation rights that severely affect the ability of local communities to use their resources, and in many cases, investment projects whether mining operations or large tourism facilities have led to the diversion and pollution of scarce water supplies. While these issues may emerge in relation to both domestic and foreign investments, the involvement of foreign capital in capital-poor countries may affect more profoundly the balance of bargaining power between local resource users and outside investors.
3.2.5.29 In recent years, laws and policies have been adopted to grant local resource users greater tenure security, including in their relations with foreign investors. The legal recognition of collective land rights has been opted in some cases rather than individual titling. In its recent Policy Research Report, the World Bank argues that while the individualization of land rights is the most efficient arrangement in many circumstances, in a number of cases definition of property rights at the level of the group can help to significantly reduce the danger of encroachment by outsiders while ensuring sufficient security to individuals. Indeed, where the primary source of tenure insecurity is outsider encroachment, the best legal response is to recognize and enforce local group rights, and (where it does not cause undue conflict) to demarcate and record certain lands in the name of that group. Above all, awareness and vigil of local communities can greatly help in protecting the CPRs and local natural resources, such as the Chipko Movement in Uttaranchal and stopping of construction of a huge skiing and tourist resort by a foreign MNC in Himachal Pradesh.

**Ceiling on Holdings**

3.2.5.30 Ceilings on land holdings were imposed to correct the highly skewed distribution of land in the post-independence era. The other economic compulsions were: (i) there was strong evidence indicating an inverse size - productivity relationship, hinting that the aggregate production efficiency is hampered when land is held in large holdings; (ii) there was some evidence that large holders of land left large areas fallow thereby perpetuating uneconomic land use; and (iii) a large proportion of the population were land-based poor who wanted land as an economic resource for their livelihood. It was thought that surplus land could be distributed to such poor people. The land ceilings move was largely to provide social justice and equity and not so much on the grounds of increasing agricultural production and productivity.

3.2.5.31 The main purpose of placing ceilings on landholdings was to detect and acquire surplus land that was above economic holding size and have it redistributed among the landless who require an economic base. However, redistribution failed in most States. Acquiring surplus land was not effective and as the acquisition was
meager the redistribution was also insignificant. This failure was mainly due to the lack of political will and poor management at the village level. The surplus land distributed does not form even 2 percent of the total net operated area, and even this small share was concentrated in only six States (West Bengal, Maharashtra, Andhra Pradesh, Assam, Jammu and Kashmir, and Rajasthan).

3.2.5.32 Yet, the ceiling laws have succeeded in keeping a check on concentration of land in the hands of a few. A large number of experts now agree that the further lowering of ceilings and further implementation of ceiling laws is no longer a feasible option of engendering social equity. Marginalization of the size of holdings, with the proliferation of minuscule holdings, has emerged as a new challenge. The proliferation of small economically non-viable land holdings, a major agrarian handicap, should be stopped through suitable legislative measures.

3.2.5.33 Certain corners have been voicing rolling back land ceiling laws with the argument that the current ceiling limits hinder investment in agriculture and diversification to high-tech agriculture. It is argued that while there are no limits on investment in other sectors why should agriculture face restrictions. It is further argued that economies of scale could be achieved by allowing larger holdings and that large farms would also attract greater investment in the agriculture sector and would generate exportable surpluses and would help to participate effectively in the world market. However, these arguments must be considered in light of the following ground realities:

i. poverty is essentially a rural phenomenon,
ii. nearly 60% of India’s population is employed in agriculture,
iii. land, even a small piece of land, is the main anchor of livelihood security,
iv. the unemployment especially in rural youth (and the associated socio-economic tensions) has been increasing and there is limited scope for off-farm or non-farm employment and alternative income, and
v. the lack of access to or entitlement to land and associated resources and
generally low agricultural productivity are the main causes of persisting rural
poverty.

3.2.5.34 The potential economy must not allow the majority of the rural poor to be
further alienated from their main source of survival – the land resource, even a small
piece, without providing viable alternative solution. Moreover, as mentioned earlier,
family owned small holding farms are more efficient and, if duly supported, can lead
to increased aggregate food production, higher level of employment for farm and
family labour, higher household food security, improved practices of soil and water
resource management and have higher multiplier effects both in rural and urban
economy. Thus, the existing land ceiling laws should not be rolled back. However,
under certain circumstances, necessitated in the interest of the community and majority
resource-poor, necessary relaxation may be permitted in case of wastelands. But, the
relaxation should not be used to evade income tax or indulging in land speculation.

Land Markets

3.2.5.35 Non-cultivating households tend to buy land mostly as assets or rentiers.
The land is used as a “store of value”, often with a view to making capital gains from
land. As a result, land is not used adequately and efficiently and factor productivity of
agriculture tends to be low by international standards. At the other end, land hunger,
which is intimately connected with rural poverty, tends to increase, but the high land
prices prohibit them to buy land in the open market on their own. The high land
prices have, however, induced many marginal farmers to sale off their lands, often
without alternative livelihood anchor, thus compounding the rural social problems.
Dealing with problems of interlocked markets and correcting market distortions and
enhancing land relations is thus an important issue. A massive programme based on a
new vision of how the government can ensure that labour is more gainfully absorbed
in agriculture and the poorest have some standing in the rural society through
ownership of land is needed. In view of this, the following interventions in the land
market are essential:
• Long term loans from institutions for land purchase like house purchase for the landless (the IKP experience in Andhra Pradesh, Box IV) and making available to them technical assistance to enable them to plough the land in keeping with the needs of productive agriculture and even commercial farming, and providing them with marketing support.

• A systematic programme for conferment of homestead rights and also allotment of homestead for landless poor (The IKP experience in Andhra Pradesh, Box IV).

• Contract farming should be redefined precisely indicating how it would protect or enhance the land and livelihood rights of the farmers. Otherwise, it will aggravate instead of solving the problem of agriculture. As discussed earlier, based on equity considerations, promotion of corporate farming through liberalising land ceiling will be generally of little relevance in the Indian context.

Consolidation of Holdings

3.2.5.36 Legislation on consolidation was adopted in some States in order to reduce inefficiency in operations and cultivation. For the most part, these laws and associated consolidation programmes have failed to achieve their goals because of the lack of political will and administrative difficulties. The legislation was difficult to formulate and did not consider the reality of the caste system within the farming communities, and the local processes of politicization. Except in Punjab, Haryana and Uttar Pradesh, consolidation programmes have not made any impact. Given its importance and the extremely unsatisfactory results of this programme, it is essential to evaluate the effectiveness of the legislation and to rethink an institutional solution.

3.2.5.37 Demographic and economic pressures naturally cause fragmentation of land, and marginalization of holdings can be seen as an important outcome of this. The numbers of holdings smaller than 1 ha and especially of those smaller than 0.5 ha have been increasing over the decades. This process causes concern. One successful
approach has been taken by a few groups of small and marginal farmers in some of the States such as Karnataka, Maharashtra, Punjab, etc. These farmers came together to cultivate a particular crop (strawberries, tomatoes, gherkins, rose or onions) on a contract basis with a price for the produce agreed in advance with the contractor (contract farming). They could therefore overcome the viability threshold to cultivate such investment-intensive crops, but the outcomes were not uniformly successful over extended time and space. These experiments provide an institutional alternative to consolidation of holdings and should be critically researched and promoted as per location-specificity.

3.2.5.38 In the context of globalization, it is clear that the small and marginal farmers are handicapped when it comes to participation in domestic and foreign markets. Their competitiveness is hampered by the crops they produce, by market imperfections and by a lack of access to available information. Other factors that inhibit India's farmers in competitive world markets include the small size of landholdings and low throughput of production. It is difficult for the small and marginal farmers to grow the commodities that are in demand in the world market, mainly because of the high cost of cultivation of these goods and their limited knowledge of them. In order to overcome this problem it is important to encourage farmer-centric contract farming and entrepreneur groups which can take the risk of competing to grow the crops with a domestic and international demand. Contract farming will help efficiently link production, processing, value addition and marketing for small farmers, and deserves a serious attempt.

**Integrating Forest, Land and Tribal Policies**

3.2.5.39 Forest policy, including the rights of tribal populations, is interactively linked with land policy. Until 1988, forest was considered as the sole property of the State, and State had all the rights to manage and appropriate the revenue generated from forests. However, with the emergence of the concept of joint forest management (JFM) and community forest management (CFM), management and revenue-sharing with the local people (often through Panchayat Raj or similar parallel political
institutions) was considered by many States as a method of involving people and giving them rights on the forest resources. The main emphasis of the 1988 Forest Policy was to arrest forest degradation, retaining as well as enhancing the quality of land use in this sector. The policy also aims to create a partnership between forest dwellers and forest development authorities. The recent Tribal Bill has ironed out some of the limitations of the forest and land use policies and granted following rights to the tribals:

- Right to hold and live in the forest land under the individual or common occupation for habitation or for self cultivation for livelihood by a member or members of a forest dwelling Scheduled Tribe;
- Rights such as nistar, by whatever name called, and uses in erstwhile princely States, Zamindari or such intermediary regimes;
- Right of access to, use or disposal of minor forest produce;
- Other rights of uses or entitlements such as grazing and traditional seasonal resource access of nomadic or pastoralist communities; right of habitat and habitation for primitive tribal groups and pre-agricultural communities;
- Rights in or over disputed lands under any nomenclature in any State where claims are disputed;
- Rights for conversion of Pattas or leases or grants issued by any local authority or any State Government on forest lands to titles;
- Rights of conversion of forest villages into revenue villages;
- Rights of settlement of old habitations and unsurveyed villages, whether notified or not;
- Right to access to bio-diversity and community right to intellectual property and traditional knowledge related to forest biodiversity and cultural diversity;
- Right to protect, regenerate or conserve or manage any community forest resource which they have been traditionally protecting and conserving;
- Rights which are recognised under any State law or laws of any Autonomous District Council or Autonomous Regional Council or which are accepted as rights of tribals under any traditional or customary law of any State;
• Any other traditional right customarily enjoyed by the forest dwelling Scheduled Tribes which are not mentioned above but excluding the right of hunting.

3.2.5.40 Implementation and integration of the above Rights and provisions is one of the most pressing areas in the entire agrarian relations and it is perhaps also the area where State policies have been least effective so far. Indeed, tribals are the poorest lot in the country with the lowest human development score. Therefore, it is no wonder that most of the tribal areas in the country are in ferment. The issue of tribal land rights should be taken up on a war footing and the following recommendations are made for this purpose:

• Prevention of land alienation and restoration of alienated land;
• Changes in rehabilitation policy providing land for land, and means of livelihood and not just livelihood compensation; ensure stake for displaced persons in future prosperity;
• Empowerment of tribal community for command over its resources and ancestral domain; and
• Large scale bids for mineral resources should be carefully examined with a view to protecting tribal domain, and appropriate policy of resettlement and rehabilitation of displaced cultivators should be formulated and effectively implemented.

3.2.5.41 Refocusing of management decisions to a more decentralized level of governance and people involvement in these decisions is a major paradigm shift in the Forest Management Policy. As highlighted in a recent FAO-supported study, the JFM system in India needs to be further transformed towards the sustainable development of the community living in and around the forested regions by integrating forest management with sustainable rural development. The study has suggested the following model (Figure 1) for management of non-timer forest
products (NTFP) and of forest in general for sustaining livelihood and long-term conservation.

![Diagram of a Conceptual Model for Management of NTFPs and Forest for Sustaining Livelihood and Long-term Conservation](image)

**Figure 1. A Conceptual Model for Management of NTFPs and Forest for Sustaining Livelihood and Long-term Conservation**

*Source: Exploring Options for Joint Forest Management in India; Forestry Policy and Institutions Working Paper No. 7, FAO.*

3.2.5.42 As indicated in the figure, the community assumes the central role in steering all the development processes and the government provides supporting services. The role of the local communities (the central large rectangle in the Figure) are as follows:-

- Led by Panchayati raj institution and other grassroot peoples’ organisations, development of local institutional and organizational capacity to undertake development planning and mobilizing local and external resources; provision of health care, drinking water and education;
• Establishment of councils/cooperatives for protection and management of existing forests; creation of new (commune owned) forests in deforested and degraded lands to meet their current and future needs;

• Decentralization of the decision making structure to local level; setting mechanism for inter-departmental cooperation and promoting participation of NGO and local people in the decision making process; recognition of the value of local production systems and cultural diversity; and

• Promotion of local processing of forest-products and their marketing through village cooperatives; development of partnership with private sector and NGOs.

3.3.5.43 The government is required to provide the following support:

• Establishment of legal, regulatory, conflict resolution and enforcement structures for the management of forest and common land resources; mechanism to redirect a part of revenue to the local community from the management of forests and to compensate them for the loss of revenue due to closure of area for regeneration or other technical reasons;

• Organization of science; information, technology and extension (SITE) services to support planning, monitoring and evaluation of forestry development and poverty alleviation programmes and periodic reporting on the state of poverty, progress achieved and constraints in the way;

• Marketing, processing and value addition: In case of NTFPs, there is market failure as well as institutional failure. There are possibilities for private-public-partnership (PPP) in cultivation, processing, value addition and marketing of timber as well as non-timber forest products, which should be harnessed.

The proposed community-government congruence is bound to synergise social, economic and ecological security of forests, forest-dwellers, tribals and other people around forests.
Integrated Coastal Zone Management

3.2.5.44 Coastal zone is defined as an area from the territorial waters limit (12 nautical miles) including its seabed up to the landward boundary of the local self-government abutting the sea coast. Coastal zone also includes inland water bodies influenced by tidal actions including its bed and the adjacent land up to the landward boundary of the local self-government abutting such water bodies. In case of ecologically sensitive areas, the entire notified area/biological boundary of the area will be included in the coastal zone.

3.2.5.45 Coastal environment plays a vital role in nation’s economy by virtue of the resources, productive habitats and rich biodiversity. India has a coastline of about 7,500 kms and nearly 250 million people live within a distance of 50 kms from the coast. The coastal zone is also endowed with a very wide range of coastal ecosystems like mangroves, coral reefs, sea grasses, salt marshes, sand dunes, estuaries, lagoons, etc. which are characterized by distinct biotic and abiotic processes. The coastal areas are assuming greater importance in recent years, owing to increasing human population, urbanization and accelerated developmental activities. Over 25% of India’s population will live in coastal areas. These anthropogenic activities have put tremendous pressure on the fragile coastal environment. An integrated and ecologically, economically and socially sound and sustainable coastal zone management system should be put in place jointly by government agencies and coastal communities.

3.2.5.46 A Committee was appointed to Review the Coastal Regulation Zone Notification 1991, by the Ministry of Environment and Forest, Government of India, under the Chairmanship of Prof. M.S. Swaminathan. In its Report, February, 2005, the Committee had identified need for extensive micro-surveys to critically assess the socio-economic and ecological assets and liabilities in the coastal zone and suggested that until the micro-surveys are completed the country should strictly adhere to the current rules of CRZ Notification 1991. The recommendations of the Committee for the setting up of a National Board for Sustainable Coastal Zone Management along with its supporting professionally-led institutions should be accepted and
promptly acted upon by the Ministry of Environment and Forests jointly with other concerned Ministries and Departments. The proposed public policy facilitation institutions should develop also the capacity for fostering professional conflict resolution mechanisms. They should also develop expertise in ecological economics as applied to the coastal zone. Above all, they should spearhead an ecological literacy movement through ICT based Rural Knowledge Centres.

Rehabilitating Wasted and Degraded Lands

3.2.5.47 Defining degraded lands, the National Remote Sensing Agency (NRSA) for the Department of Land Resources states: “Degraded lands (are those) which can be brought under vegetative cover with reasonable effort, and which are currently under-utilized and land which is deteriorating for lack of appropriate water and soil management or on account of natural causes. Wasteland can result from inherent/imposed disabilities such as by location, environment, chemical and physical properties of the soil or financial or management constraints.”

3.2.5.48 There is a great deal of inconsistency in information about land degradation and on size of cultivable waste land available from different sources (Annexure V). It is generally agreed that the cultivable waste together with fallow lands cover about 55 million ha. and forest wasteland account for additional 35 million ha. With the increasing emphasis on agro-forestry and with faithful implementation of Joint Forest Policy and the recently passed Tribal Bill, there is ample scope for integrating the development plans of the Forest Wastelands as well as the cultivable agricultural wastelands through participatory micro-planning and programme implementation by grassroot communities and institutions, including Panchayati Raj Institutions, comprising Programme Implementation Agencies (PIAs). As the wasted lands are likely to be owned either by the Government or private parties or communities, PIAs should ensure participation of all stakeholders in a consortium mode.

3.2.5.49 As seen from Annexure VI, both natural and manmade factors and their interactions cause land degradation in varying proportions in different agro-climatic
zones, and have assumed serious dimensions in many parts of rural India. Degradation caused and accelerated by human action is more extensive than the one caused by natural factors. The Himalayan region, Peninsular Plateau and Hill Regions are more exposed to this malaise. In terms of popular perceptions, degradation caused by human action could be attributed to sheer poverty of the farming community or to the spillover damages of one or the other type of development activities. While the extent of poverty did exert a significant negative impact on the level of degradation, there was a rather insignificant relationship between development-related factors and land degradation. The resource variable such as net sown area and forest cover also seem to have a significant and inverse relationship with degradation. This, among other things, indicates the importance of such resource variables in enhancing soil quality, increasing fuel-fodder and food production and reducing the compulsions of the farmers to ‘mine’ the land in an unsustainable manner. The results also strengthen the need for viewing land degradation from the users’ perspective.

3.2.5.50 It is clear that land degradation is a localized problem and depends not only on the agro-climatic and socio-economic conditions of the region but also, and perhaps more importantly, on the farmers’ access to assets. The livelihood strategies of the poorer farmers are indeed quite different from the profit-maximizing approach of the large and rich farmers. For the land-poor, the available scarce land resource is the very foundation on which their sustenance stands. On the other hand, the land rich usually go more by short term profit gains, possibly because they can afford to overlook and absorb a certain degree of deterioration in the quality of their land.

3.2.5.51 In face of the declining per capita availability of cultivated land on one hand, and the prevalence of large and expanding areas of cultivable waste land, on the other, new policies and action are called for rehabilitating and judiciously utilizing the degraded lands consistent with socio-economic acceptability and technological capability. It is important to build a reliable data-base on the temporal profile of land degradation. Definition and categories of wastelands should be standardized and uniformly adopted by the data collectors, planners and policy-makers. The Himalayan and the Peninsular regions are among the most susceptible regions prone to land
degradation. While watershed programmes extensively cover the latter, the same is not true for the former. There is thus an urgent need to initiate specific land development programmes for the mountainous agro-climatic zones based on watershed approach.

3.2.5.52 Rehabilitation of degraded lands can be achieved primarily through micro-watershed based approach. But, the watershed development programmes have only partially been successful in the northern States. The relevant issue that needs to be addressed in this context is how the polarized and heterogeneous rural communities, a characteristic feature of north Indian plains, can be brought together for a meaningful collective action. The philosophy of the watershed programme is inherently linked with the empowerment of rural communities living within the watershed. Full participation of the communities led by Panchayati Raj Institutions and duly supported by NGOs, is essential.

3.2.5.53 The external assistance for implementing the programme agreed by a participatory approach should directly reach the concerned community/local-level functionaries. After the launching of the programme, the role of the government and NGOs should be restricted to its mid-term monitoring and evaluation. The success of the land rehabilitation programmes is closely related to an authentic and workable formulation of legislation clearly defining the ownership of natural resources like common grazing land, forest cover and water resources within the village boundaries. In particular, the concept of stakeholders’ participation needs to be operationalised through such legislative measures.

3.2.5.54 The land rehabilitation and management policy should be seen as an integral component of the National Land Reform Programmes and in convergence with other related activities it should promote institutional framework that would encourage the productive utilization of land by synergizing the inputs of all concerned Ministries and Departments. The Tenth Plan had emphasized on:

   i. Participatory land and water conservation based on a micro-watershed approach;
ii. Involving corporate sector in restoring wastelands and reclaiming degraded lands, with sharing arrangements on public lands while encouraging farm forestry on private wastelands;

iii. Channelising greater resources for the development of wasteland through the involvement of financial institutions;

iv. Capacity building of various stakeholders through training programmes and awareness campaigns;

v. Creation of a comprehensive land use database by using latest technologies in consultation with the local people to capture the ground realities; and

vi. Delineation of “hot spots” of land degradation and using successful experience, undertake participatory microplanning and reclamation measures consistent with agro-ecological and socio-economic settings.

3.2.5.55 The above thrust areas of action are equally valid even today and will remain so at least in the short to medium terms. However, the involvement of the corporate sector should be planned and monitored carefully and critically, particularly keeping in mind the interest of landless and near-landless agricultural families. Linking with the Bharat Nirman and National Rural Employment Guarantee Programme, the landless and near-landless people could be engaged in the reclamation process and such reclaimed lands could be distributed to them individually or in groups (keeping in mind both equity and economies of scale) under an arrangement which will ensure end-to-end approach. The corporate sector could also be allotted adequate area of the land it must have helped to reclaim and serve a “nucleus” whereas the small holders will serve as “estates” under a “Nucleus-Estate: (NE) system to promote cost-effective and competitive “mass production by masses” and not “mass production by machines.”

3.2.5.56 Depending on agro-ecological capacity and socio-economic viability, the Nucleus–Estates could specialize in specific production-processing-distribution chains viz bio-energy plantations, medicinal plants and botanicals productions, agro-pastoral-based livestock production, etc. The Land Use Boards, the Waste Land Development Board, the various Watershed Development Programmes and other
such National, Regional and State level initiatives must congrue together and coordinate their efforts under one umbrella. Since bulk of the degraded and wasted lands are in rainfed areas, particularly arid zones, the recently announced National Rainfed Area Authority could play the orchestrating/coordinating role.

3.2.5.57 Permanent pastures, grazing lands, village forests, village ponds and, most important, ground water constitute important common property (CP) resources. The Common Property Rights on these resources are extremely important for the landless and the land-poor households for their sustenance. In the absence of clearly defined rights and institutions for management of these resources, often being no man’s land, these are over-exploited and left uncared for. These resources are also encroached upon by rural power lobbies, thus excluding the poor from utilizing them - often the only resource which they could fall back to. While in most States area under common properties has decreased, in some States like Punjab and Maharashtra, despite the increased demographic stress on agricultural land, area under CP resources has increased. Panchayati Raj and other grassroot institutions should determine the size and delineation of CPRs in each village or group of small villages and mange them sustainably especially to support livelihood security of landless and land-poor people. Appropriate rules should be established and adhered to use the rights judiciously for utilizing and conserving the CP resources and for sharing the products derived from these resources.

**Land Records and Title**

3.2.5.58 An appropriate system of guaranteeing land title and tenure security is essential for growth and poverty alleviation in rural areas. The system can be built only on accurate and valid record of land rights. Therefore, government should strengthen land administration and develop an appropriate system of guaranteeing land title and land tenure security. The Common Minimum Programme of the National Government (NCMP) states, “Revenue administration will be thoroughly modernized and clear land titles will be established”. If fulfilled, this will virtually
transform the landscape, economically, politically and socially - there can be no empowerment of the community without entitlements.

3.2.5.59 In fact, a Centrally Sponsored Scheme on Computerization of Land Records (CLR) was introduced during the Seventh Plan Period with 100 percent financial assistance from the Central Government for pilot projects in a few selected districts. The main objectives of the scheme were to: (1) computerize ownership and plot-wise details for issue of timely and accurate copy of the Records of Rights of legal sanctity to the landowners; (2) achieve low-cost, easily reproducible storage media for transparent and reliable long-term land information system; (3) provide fast and efficient retrieval of textual and graphical information; and (4) create a Land Information System (LIS) and database for the agricultural census to facilitate planning and monitoring.

3.2.5.60 The scheme has been operational for the last 15 years, but barring 5-6 States, the progress in most States has been slow. Many bottlenecks are also emerging in the process, including: (1) delayed transfer of funds to the final implementing authority in the field by the State governments; (2) a delay in the development of appropriate software tailored for the specific requirements of different States; (3) a lack of adequate training facilities to the revenue staff who handle computers in the field areas; and (4) unavailability of private vendors to enter data. In addition to these, an administrative system for the computerization has not been clearly set up. It is operated under the State-government revenue departments, sometimes with only partially trained staff. Therefore, a quantum change in this process is needed.

3.2.5.61 The existing scheme “Computerisation of Land Records (CLR)”, should be expanded to integrate title and deed registration, leading to clear titles. To realise this convergence, State Governments should transfer Registration and Stamps to the Revenue Departments. Each State should institute a single, integrated, professional agency for preparation and updating of land records using modern technology, dispensing with the use of stamp paper and providing comprehensive land records, including title, on the Website which could be viewed by all. The “computerised”
land records should be legalised, on the lines of Karnataka’s “Bhumi” programme and a few other such initiatives. The Centre should provide bulk of the financial resources for the purpose. Further, officers heading this project should have stable tenures.

3.2.5.62 Village Knowledge Centres or Kiosks should be established at appropriate and accessible-to-all sites, such as at Gramsabha’s or Panchayat’s premises or at agriclinics following a public-private–partnership approach. Capacities of Panchayat Raj institutions should be strengthened by training concerned personnels, including women, at each centre/kiosk whose connectivity with Sub-Divisional, Tahsil, District and State levels should be ensured. On a sharing basis, 75% from Central government and 25% from State government, training institutes on land records should be established in each State. In initial stages, the operational expenses should be provided by the Centre.

3.2.5.63 A Monitoring and mid-course correction system should be jointly instituted by Central and State governments to undertake and encourage social audits and peer reviews to check the quality of land records available on the Website and functioning of the system at Panchayat and higher levels. While Panchayats should be empowered for the overall management of land and other natural resources, the Panchayati Raj institutions and other rural institutions doing well in land record management should selectively be supplemented with additional financial resources and administrative powers.

Women’s Rights to Land

3.2.5.64 Women constitute a large portion of the economically active population engaged in agriculture, both as farmers and as farm workers, and play a crucial role in ensuring household food security, despite enjoying very limited rights to land. The role of women in agricultural production has increased in recent years as a result of men’s migration to urban areas and absorption in non-agricultural sectors. However, in many parts of the country, women have little or no access to resources such as
land, credit and extension services. Moreover, women tend to remain concentrated in the informal sector of the economy. In plantations, they often provide labour without employment contracts, on a temporary or seasonal basis or as wives or daughters of male farm workers. Although land and natural resource legislation tends to be gender neutral or to explicitly prohibit sex or gender discrimination in relation to land, it is scarcely implemented in rural areas.

3.2.5.65 Women’s unequal access to land is one of the main causes of gender inequality and socio-economic hardship to women, and consequently to the entire society. The absence of land titles prevents women farmers from accessing credit. Enhancement of women’s rights and entitlements to land will greatly boost rural economy, poverty alleviation and livelihood security. The following policy actions are suggested to enhance women’s ownership and control over land:

- Ensure the recording of women’s inheritance shares by the patwari in all land records. In cases where women own land (via any means), ensure that their names are entered in the corresponding land record.

- Land distribution by the government must be done equitably and titles to women should be clearly recorded.

- Help women, individually or collectively in groups, with managing and purchasing assets and leasing land and other associated assets. Enhance access of women groups to village common lands and village forests.

- In recognition of the instrumentality of women’s agency in co-managing Commons for subsistence use, policy and legislation should ensure that women be recognized as co-owners and inheritors wherever they reside, irrespective of their marital status.

- Promote group-based production activities related to application of women owned lands such as group-farming by groups of women, group-seed production, or joint management of fish ponds, poultry farms or animal husbandry.
• Enhance women farmer’s infrastructural support, credit access, information support, and marketing cooperatives support. Create special risk funds to provide insurance coverage to women-headed farm households for crop failures caused by lack of rain, drought, and damage by wildlife and landslides.

• Develop and support training programmes for government officials and raise awareness at all levels of relevant legislation on women’s right to land and resources. This can be done through radio and TV, for example special programmes could be relayed on the issue of women’s right to land, and by inserting information messages in slots between news programmes.

• Devise the collection of gender-disaggregated data on land and households in all major government surveys, National Sample Survey, and Agriculture–related censuses. Conduct and widely disseminate, findings of research studies on the correlation between women’s land and property ownership with overall well being of women.

3.2.5.66 The Hindu Succession Amendment Act, 2005, passed by the Parliament bears heavily on rights to land ownership for women, especially in context of the increasing feminization of agriculture. The National Commission on Farmers, in collaboration with the M.S. Swaminathan Research Foundation had organized a Consultation on this subject which had made several useful recommendations (Annexure IV).

3.2.5.67 The concerned Ministries and Departments at Central and State levels particularly the Ministries of Rural Development, Planning, Law, Tribal Affairs, Panchayati Raj, Agriculture and Environment and Forests should effectively implement the various recommendations of the above-mentioned Consultation and the Ammended Act. For instance, the National Planning Commission, in close consultation particularly with the Rural Development Ministry, should incorporate targets for redistribution of land to women with secure legal rights, including rights to forest land and agricultural land within the 11th Plan, and include land reform and
3.2.5.68 The Administrative Departments should promote the formation of community-based women's collectives and support groups beyond self help groups (SHGs) to deal with violence and to promote women's property rights. The role of Panchayats to address these issues should be promoted. Awareness-raising programmes should be developed about women’s legal rights to land and resources and gender sensitive government programmes among men, women and children in India’s villages, small towns and elsewhere. The government and programmatic staff should have legal literacy on the subject.

3.2.5.69 Government schemes should be initiated to enable women to lease land collectively by forming groups, with the mandate that the land would be used for collective economic activity (crop cultivation, poultry or animal husbandry) on long-term leases, as in Bihar for fish ponds and in Tamil Nadu for wasteland development. This will assist in increasing women's assets through strengthening skills, knowledge, bargaining power, and access to new technologies. Such initiatives should be linked with Bharat Nirman, National Rural Employment Guarantee Programme, JTY/SGSY and other initiatives of the Ministry of Rural Development.

3.2.6.0 Summary Policy Recommendations

**Land Reform at the Centre of the Country’s Development Agenda**

3.2.6.1 Land is an asset of enormous importance for over 600 million of rural dwellers in India. The nature of rights and how strongly they are held vary greatly, depending on competition for land, the degree of market penetration and the broader institutional and political context. The picture is diverse and complex between States. Nevertheless, certain generalizations can safely be made. Pressure on land is set to increase over future decades, given the impacts of continued population growth, globalization of markets and activities, and climate change.
3.2.6.2 As a resource becomes scarcer and more valuable, those with weak rights to this resource will tend to lose out. In the case of land, particular groups tend to be more vulnerable to such dispossession, including the poor, those in peri-urban areas, indigenous people, women, those relying on common property resources, and those in areas of conflict. A lack of attention to land tenure and security of land rights also risks hampering growth by discouraging local and foreign investment, because of the perceived risks involved where property rights are poorly secured.

3.2.6.3 Land policy in post-Independence India has evolved through different phases. These include: land reforms (tenurial rights, land ceiling, land distribution and land consolidation), land development, including Wasteland Development and Integrated Watershed Development Programmes and lately land administration, land records and titles, land leasing and land markets. The policy interventions have had varying impacts on poverty and the overall development process. The land-reform measures have generally positively impacted equity and poverty reduction. The measures dealing with the quality of land have a partial to significant impact on environmental parameters. In addition to these, the land-policy instruments were instrumental in transforming other development policies.

3.2.6.4 Land reform must therefore be seen as a part of the wider resource reform programme in rural areas and land access should be mainstreamed within the national development agenda, especially the poverty reduction programme. It should ensure secured access to land and water, secured tenurial relationship, support services and a high degree of participation by the poor in collective decision-making under Panchayati Raj Rule. A programme of rural resource transfer would encounter strong resistance not only from the rural elite but also from interests that want to promote agro-business, corporate agriculture and multinational interest in mineral resources often located in tribal areas. A strong political will is needed to implement the various measures, which must be duly monitored and kept progressing at the desired pace. We must recognise that “land reform is not only in the interest of those who have nothing but also in the interest of those who have something to lose.”
Key Areas for Urgent Action

3.2.6.5 The key areas for future land policy action include legalizing the tenancy market, land leasing, contract farming, and improving efficiency and effectiveness of integrated watershed and wasteland development to assume greater significance, and streamlining and updating land records, rights and administration. Such interventions involve internalisation of issues relating to the political economic aspects of the reform measures including institutional reforms.

3.2.6.6 Legislations and their thoughtful and timely implementation are needed to:

- Check the outflow of prime agricultural land which is endowed with necessary infrastructures for high and sustained agricultural productivity (irrigated land).
- Arrest fragmentation and minusculing of land holdings to promote self-reliance and to ensure livelihood security of farm households.
- Redefine self-cultivation and resident qualification to ensure transparent tenancy rights
- Strengthen rights to lands and use rights in the following respects:
  - No further relaxation of ceilings, nothing in technical or factor efficiency argument against this.
  - Allotted and alienated land to be restored.
  - Handing over possession of allotted land.
  - Settlement of land dispute court cases to be hastened, and Bhoodan and temple land and the freed land to be distributed to landless.
  - Quash benami transactions and grant power to reopen closed cases.
  - Ban exemptions from agricultural ceiling for land converted to non-agricultural use and for corporate farming.
  - Reduction of ceiling limits to Non-resident Indians and for those who are predominantly non-resident and are non-resident farmers.
3.2.6.7 Make tenancy relationship open, and increase tenants’ access to agricultural support institutions, such as technology, credit, etc. and repool resources through creating Self Help Groups (SHGs), Small Farmers’ Estates (SFEs), and rural cooperatives on NDDB pattern.

3.2.6.8 Appropriate policies are also needed to provide long-term institutional loans to landless and near landless for purchasing land and also to provide them technical assistance to efficiently manage the land and assist them with marketing support. Further, allot them homestead plots to increase their nutritional and livelihood security.

3.2.6.9 The recent Tribal Bill, which elaborates their rights to land use, should be integrated with the National Forest Policy to create a synergistic partnership between forest dwellers and forest development authorities. Large-scale bids for mineral resources should be carefully examined with a view to protecting tribal domain and to ensure proactive resettlement and rehabilitation of displaced persons.

3.2.6.10 Emphasise decentralised governance and decision-making, particularly in Forest Management Policy, and Community Forest Management should become the order of the day. Under this arrangement, the community should assume the central role in steering the development process and the Government should provide services, regulations, and protection to the weaker sections.

3.2.6.11 An integrated and ecologically, economically and socially sound coastal zone management system should be put in place jointly by the Government agencies and coastal communities. As recommended by the Swaminathan Committee, 2005, a National Board for Sustainable Coastal Zone Management along with its supporting professionally-led institutions should be established by the Ministry of Environment and Forests in close association with other concerned Ministries/Departments.

3.2.6.12 Women rights to land, especially those enunciated in Hindu Succession Amendment Act, 2005, should be strictly implemented.
3.2.6.13 In order to augment availability of cultivable land, new policies and actions are called for rehabilitating and judiciously utilizing the degraded lands consistent with socio-economical acceptability and technological capability. Reliable data bases on the temporal profile of land degradation is urgently needed. Micro-watershed based development of such areas should be given high priority, particularly in the Himalayan and the Peninsular regions which are highly prone to land degradation.

3.2.6.14 Although proposed in the 10th Plan, the involvement of the corporate sector in the management of waste and degraded lands should be monitored carefully and critically. Linking with the Bharat Nirman and National Rural Employment Guarantee Programme, the landless and near-landless people could be engaged in the reclamation process and such reclaimed lands could be distributed to them individually or in groups (keeping in mind both equity and economies of scale) under an arrangement which will ensure end-to-end approach. The corporate sector could also be allotted adequate area of the land it must have helped to reclaim and serve as a “nucleus” whereas the small holders will serve as “estates” under a “Nucleus-Estate” (NE) system to promote cost-effective and competitive “mass production by masses” and not “mass production by machines.” The Land Use Boards, the Wasteland Development Board, National Rainfed Area Authority and other concerned bodies should synergise their efforts in rehabilitating and effectively utilising the degraded lands.

3.2.6.15 Panchayati Raj and other grassroot institutions should determine the size and delineation of CPRs in each village or group of small villages and manage them sustainably especially to support livelihood security of landless and land-poor people. Appropriate rules should be established and adhered to use the rights judiciously for utilizing and conserving the CP resources and for sharing the products derived from these resources.
Key Research Areas

3.2.6.16 Comprehensive research is needed to generate reliable information to guide adjustment in or formulation of new appropriate policies. The research areas may include: (i) understanding of the underutilization of land, the causes behind increase in current fallows and around the urban centres, (ii) analysis of the land-lease market; who leases from whom, under what terms and conditions and under what set of circumstances; the role of the caste factor; the economies of scale in production; the response to new technologies and trade opportunities, (iii) how are the land-credit or land-labour or land-credit-product market interlocking and shaping themselves, especially under contract farming? and (iv) how can the initiation, and sustenance of peoples’ participation in land development programmes, especially the role of PRIs and other grassroot institutions, can be ensured?

Adjust Mechanisms for Land Redistribution and Distribution

3.2.6.17 Promoting rational access to land, especially where it is highly skewed, is crucial for social justice, political stability, rural development and peaceful co-existence. Large areas under prolonged litigations should be freed and restored soonest to the genuine title holders. Reclaimed and other available lands, such as temple lands, should be brought under dynamic and effective land redistribution programmes. The appropriateness of the ongoing mechanisms should be assessed. A menu of options may be the most viable approach. Provision should also be made to exit farming in a phased and confident manner, if desired. The policy of distribution of land to individual households for cultivation or house sites needs to be balanced with the need to preserve common lands in each village and community rights in these. Gram Sabhas should oversee this activity rather proactively.

Improve Land Administration and Land Tenure Security

3.2.6.18 Simple and inexpensive methods to bring together existing records and make them open to the public are essential in establishing transparent and corruption-free administration of land and property rights. Outdated, inefficient, incomplete and
inaccessible land registers and land administration systems generate conflicting claims and fuel disputes. In recent years there has been considerable innovation in this regard. One welcome shift in mainstream thinking has led to less emphasis on formal individual land titling as the essential tool to secure rights, in favour of a broader range of interventions according to cost and context. There is a need to:

- develop and disseminate a range of tools for improving land tenure security and delivering low-cost land titles (including group titles) appropriate for different groups and circumstances, paying special attention to the specific land tenure security needs of poorer and more vulnerable groups;
- systematically support democratic land institutions and land information systems that are decentralised and problem centred, and make links with existing indigenous and customary mechanisms for managing land; and
- improve access to appropriate and comprehensive systems of land dispute resolution incorporating formal, alternative dispute resolution (ADR) and customary procedures.

**Capacity Building to Implement Agrarian Reform**

3.2.6.19 New approaches to land policy require investment in essential skills including surveying, land registration, land use planning, land law, valuation and community-based planning and management. This calls for supporting opportunities for professional development, lesson sharing and capacity building, including at the university level, in centres of excellence and through learning networks of policymakers, practitioners and civil society. Building the capacity of citizens to use the opportunities offered by the law is of great importance to bridge this gap. Measures may include awareness-raising campaigns to disseminate information concerning land policies and laws, such as legal literacy programmes for women and vulnerable groups. The Village Knowledge Centres could particularly be helpful in this regard.
Strengthen Civil Society Groups and Networks

3.2.6.20 Supporting civil society initiatives at local, provincial and national levels is a vital element of enabling government to identify effectively and develop appropriate policies in support of improved access to land. The distribution and management of land has important political aspects. Capable and well-informed civil society organizations can play an important role in informing, and in providing checks and balances on government decision-making and the development and implementation of land policy. Exchange of experience through networks of civil society organizations, and analysis and research linked to action planning can also promote the development of appropriate land policies.

Acknowledgement

National Commission on Farmers is thankful to Shri B. N. Yugandhar, Member, Planning Commission and Dr. T. Haque, Chairman, Commission for Agriculture Costs and Prices (CACP) for their helpful inputs.

### Land policy formulation through planning period

<table>
<thead>
<tr>
<th>Plan period</th>
<th>Major issues</th>
<th>Policy thrust</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>First Plan</strong>&lt;br&gt;1951-56</td>
<td>Area under cultivation to be increased. Community development (CD) networks to take of the village commons. Vast uncultivated lands locked under large sizes of holdings.</td>
<td>Land reforms to bring in the fallow under cultivation and increase land use efficiency. Tenant to be given the rights to cultivate land. Abolition of intermediaries.</td>
</tr>
<tr>
<td><strong>Second Plan</strong>&lt;br&gt;1956-61</td>
<td>Concern about vast rainfed agriculture, low land productivity and thrust on irrigated agriculture</td>
<td>Soil conservation as an important programme. First phase of land reform implementation. Irrigation development for the rainfed areas. Training and extension work for the technology through CD.</td>
</tr>
<tr>
<td><strong>Third Plan</strong>&lt;br&gt;1961-66</td>
<td>Food security concern dominated. Cultivable wasteland to be brought under cultivation. Bringing the lagging regions under mainstream growth.</td>
<td>Area development as an approach. Intensive area development programme adopted for selected districts. An integrated land policy approach was inherent. Soil surveys were taken up.</td>
</tr>
<tr>
<td><strong>Fourth Plan</strong>&lt;br&gt;1969-74</td>
<td>Emphasis on food security continued as minimum dietary requirements to be met. Incentives were created for diversion of land towards food crops and enhancing the capacity of such land. Domination of large holding sizes and low allocation and technical efficiency.</td>
<td>Increased emphasis on irrigation and soil conservation in dryland regions and technological change introduced. Higher cropping intensity the main concern. Second phase of land reforms with land ceiling acts and consolidation of holding. Institutional changes brought in.</td>
</tr>
<tr>
<td><strong>Fifth Plan</strong>&lt;br&gt;1974-79</td>
<td>Problems of degradation land management in irrigated command areas surfaced. Drought-prone areas attracted attention</td>
<td>Drought-prone area development. Desert area development programmes, and soil conservation started and further enhanced. New impetus to dry farming.</td>
</tr>
<tr>
<td><strong>Sixth Plan</strong>&lt;br&gt;1980-85</td>
<td>Underutilization of land resources. Drought-prone areas continued to attract attention. Attention lagging areas of the background of green</td>
<td>Land and water management programme under drought-prone area programme in selected areas.</td>
</tr>
<tr>
<td>Plan Period</td>
<td>Key Issues</td>
<td>Specific Actions</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Tenth Plan 2002-2007</strong></td>
<td>An ever-increasing human and animal population pressures have let to drastic changes in the proportion of land utilised for agricultural activities, urbanisation and industrial development. Intensive agricultural practices have caused widespread land degradation adversely impacting various production systems. These areas correlate very strongly with the incidence of poverty in the country, Integrated Watershed Management approach widely promoted to increase productivity and sustainability of such areas has performed below expectation.</td>
<td>On a micro-watershed basis, involve corporate sector and financial institutions restoring and utilising wastelands, build capacity through training and creation of databases, and high priority to “hotspots” and critical interfaces to avoid irreversible damage to the ecosystem. The correction and computerisation of land records, improving the land survey processes and revisiting the earlier land-reform interventions, such as land ceiling and tenancy restrictions are other thrust areas.</td>
</tr>
</tbody>
</table>

Source: from various plan documents. These are not exhaustive statements but only indicative of the thrust. Gaps in the plan periods were annual plans and full plan documents could not be prepared for these gaps (as given in R.S. Deshpande, 2005, Current Land Policy Issues in India. Land Reforms Special Edition, Food and Agricultural Organisation, Rome)
## Annexure II

### Variations in tenancy laws across major Indian states

<table>
<thead>
<tr>
<th>State</th>
<th>Specific features</th>
</tr>
</thead>
<tbody>
<tr>
<td>Andhra Pradesh</td>
<td>In Andhra region leasing is permitted but regulated. In Telangana region leasing out land by large holders is prohibited. Smallholdings below three family holdings are allowed to lease out land for a period of five years. Exemptions are provided.</td>
</tr>
<tr>
<td>Assam</td>
<td>There are no restrictions on leasing out of land.</td>
</tr>
<tr>
<td>Bihar</td>
<td>Leasing out is prohibited except for persons with disability. Public servants with a salary not exceeding Rs250 are included under exempt category.</td>
</tr>
<tr>
<td>Gujarat</td>
<td>Leasing is prohibited and unauthorized leasing is punishable offence with a fine up to Rs1 000.</td>
</tr>
<tr>
<td>Karnataka</td>
<td>Leasing is generally prohibited. Soldiers and seamen are exempted. Recent amendments allow further limited exemptions, most granted on a case-by-case basis. Violations result in land vesting in the state.</td>
</tr>
<tr>
<td>Maharashtra</td>
<td>No ban on tenancy, but the tenant acquires the right to purchase the land within one year of the commencement of tenancy.</td>
</tr>
<tr>
<td>Madhya Pradesh</td>
<td>Abolished the past leases but not the future leases. Past leases are divided into two categories called Bhumiswami tenant without payment and other tenant with payment. They cultivate on terms and conditions agreed between parties. Other land owners can lease out their lands for one year during consecutive period of three years.</td>
</tr>
<tr>
<td>Orissa</td>
<td>Prohibited all future leases. Past leases continue after surrendering half of the leased land to the landlord or rayat.</td>
</tr>
<tr>
<td>Punjab and Haryana</td>
<td>There is no ban on leasing and the tenants do not acquire any rights on land.</td>
</tr>
<tr>
<td>Rajasthan</td>
<td>The landowners (Khatedar) can lease out for a non-renewable period of five years. Ghair Khatedar tenants can sublease for a period of one year.</td>
</tr>
<tr>
<td>Tamil Nadu</td>
<td>Leasing is permitted but the law stipulates that every contract should be in written form and in triplicate. A copy of the document shall be deposited with the revenue officials</td>
</tr>
<tr>
<td>Uttar Pradesh</td>
<td>Lease for any period is prohibited. Exemptions allowed for widows, unmarried women, military persons, students and physically disabled.</td>
</tr>
<tr>
<td>West Bengal</td>
<td>Fixed-rent leasing is prohibited, but sharecropping is allowed and subject to protection. A person lawfully cultivating others' land is presumed to be a sharecropper and is given permanent and heritable rights with a fixed level of rent (25% if sharecropper provides inputs and 50% if landlord shares in inputs). On resumption the sharecropper has to be left with 1 ha of land and the landowner can resume on a maximum of 3 ha.</td>

Annexure IV

Consultation (September 2005) on “Hindu Succession (Amendment) Act, 2005 and its Impact on Rights to Land Ownership for Women in the Context of Increasing Feminization of Agriculture” – Observations and Recommendations

- There cannot be a unique model for solution of the problems prevalent in different areas. Different models are needed for different areas.
- The voluntary transfer of land rights of women should be there. Often a woman wants to give land to her daughter, but she is restrained from doing so because of mafia/criminal pressures who simply grab her land.
- In most villages women get married within 7-8 km distance and they can take care of the land of their parents. Institutional mechanism to implement the law bypassing the obstructions should be thought out. Without protective mechanisms, it will be difficult to implement the Act.
- It is essential that similar rights for cultivation be provided to married and unmarried women. Right to cultivation should be determined by being a resident of the village. If a married woman comes back for some reason she should get access to land.
- The Hindu Succession Act should be renamed Indian Succession Act and be available to any citizen of India on demand. The option should be available to women from minority communities also to appeal under the act.
- Bureaucratic will is needed to address gender inequality. Creating a conducive environment to implement the act honestly is also necessary. The initiative of local officials in the implementation of the act should be publicized for greater adoption by others.
- MPs/MLAs should set an example by applying the act to themselves. It should be also a part of the service condition of IAS/Central Government employees, Panchayat members etc. Government should also provide incentives to local officers to proactively implement the act. This will promote acceptance by the citizen at large.
• With the Hindu Succession (Amendment) Act now in place, it is necessary that the government fixes a time frame for its implementation.

• A change in mind set is needed to address the issues facing women. There have been instances that the training has been provided to men folk to write their will so that no land is left intestate (without a valid written will), enabling women to demand their rights. Training for writing of will that benefit women folk should be provided.

• Ceiling law and definition of the family must be made uniform across the country. The importance of the act when the male members of the family migrate was emphasized.

• In the case of surplus land transfers, steps should be taken to avoid poor women getting poor quality of land.

• The cost of land registration should be waived or reduced when the land is registered in the name of women or a group of women.

• There should be a control on leasing out practice because if the land is leased out to women farmers or group farmers then they do hard work to develop the land and get better productivity out of it only to find the owners wanting to take back his land. The lease agreement should be such that it can be upheld in a court of law.

• There is a order from the State Government that the wasteland should be distributed to women’s groups by the Panachayats but the order is not having the desired effect.

• There is a need to start registration for land with joint pattas and it will be good if men will go for registration. State Govt. should document the wasteland, which is distributed under joint pattas. A wide campaigning is needed to promote joint pattas.

• The ceiling surplus land should be provided to women first, then in joint pattas and remaining land could go to men.

• At present data on ceiling surplus land, land acquired by the govt. and land distributed buy the govt. land under litigation is available for ten states only. There are no records available on how much land is registered in the name of
men and women in agriculture. There is need to collect and computerize the data regarding this aspect and without any bias. There is need to continue consultation with state governments and try to get data in women farmers at Tehsil levels. Data should be gathered to capture the fragmentation of land holdings.

- There is a need to go for Cadastral survey in the North East especially Meghalaya.
- There is a need to operationalise the law with greater awareness and opportunities to take maximum benefit of it.
- There is an urgent need for legal literacy to women in particular and farmers in general about the act. There is a strong need to strategies how this can be done and start legal literacy from school level. Legal aid should be available to the women. Small NGO group exist that are working in this area. Farmer’s organizations, bankers and panchayats should play a proactive role in the awareness and implementation of the Act. VKCs can also play an important role in this.
- Groups of women should be formed to access land accompanied by support services to improve the economies of scale because it is difficult to manage the land by individual women as she cannot access the services therefore, often sells the land. There is a need to develop village fund for women’s groups to purchase land for agriculture and other developmental activities.
- 80% of the SHGs are women SHGs but virtually none of them are land based. Necessary action should be taken to promote land based women SHGs.
- There is a need for crop diversification and a consolidated approach for off-farm and on-farm activity to enhance the income and productivity of the farm as well as assurance of livelihood and nutrition security at household level.
- Lack of access to finance is a major issue in rural areas. Inability of land banks to provide credit in spite of legislation to the effect in place should be addressed. Loans should be provided at concessional rates where land is in the name of women. Need for changes in collateral system of banking have also to be examined.
A holistic approach towards allotment of land to women should be adopted. The govt. should also help in developing the land, other basic facilities and soft loans (e.g. Malaysia).

There is a need for strengthening training for farm women and engendering of training institutions. Training on entrepreneurship development should be made a part of the Agricultural University curriculum.

CHAPTER 3.3
GUIDING PRINCIPLES UNDERLYING THE DRAFT NATIONAL POLICY FOR FARMERS

WATER

Land, water and biodiversity represent the three crucial natural assets, which are supplemented by manmade assets like inputs, credit, insurance, marketing and processing. In India, water availability is marked by spatial and temporal variability and scarcity. These are projected to increase due to lesser and skewed pattern of rainfall and rising population. The challenges that this poses for the farm sector include reducing per capita availability of water, deterioration in quality, over exploitation of ground water resources leading to lowering of the water table in many areas. Cost/time over run in completion of irrigation and multi purpose projects and poor maintenance/management of the existing systems would exacerbate the problems. Since water is vital for agriculture, action in ensuring Jal Swaraj or self-sufficiency in water availability for agriculture needs overriding priority.

3.3.1.0 Irrigation: Current Status

a) The ultimate irrigation potential for the country has been estimated as 139.88 million hectare (Mha), which include potential through Major and Medium irrigation projects (58.46 Mha), surface water based minor irrigation schemes (17.42Mha) and ground water development (64.00 Mha). By 2004-05, the irrigation potential of 99.36Mha has already been created.

b) Given the delay in the completion of on going projects, an Accelerated Irrigation Benefit Potential (AIBP) programme was launched in 1996-97 for accelerating implementation of on going irrigation/multi purpose projects on which substantial progress had been made and which were beyond the resource capability of the State Government or in advanced stages of construction and could yield irrigation benefits soon. Under AIBP an additional irrigation potential of 3.25 million hectare
through major/medium projects and 121.15 thousand hectare potential through minor irrigation has been created up to November 2005.

c) Under Bharat Nirman 10 Million hectares of additional irrigation capacity is to be created by 2009 through major, medium and minor irrigation projects complemented by ground water development. Keeping in view the present status, the target for creation of irrigation potential under Bharat Nirman has been proposed to be met largely through completion of on going major/medium projects and utilization of completed projects/schemes. Minor irrigation projects to cater to the requirements of small and marginal farmers, dalits and tribals have also been included in Bharat Nirman.

3.3.2.0 Major and Medium Irrigation Schemes

a) Over the past 150 years huge investments in large-scale water infrastructure were made and there is no doubt that the country benefited from its direct and indirect effects. However, international comparisons have revealed that vast potential remains untapped in terms of capacity to store and generate power.

b) The ultimate major & medium irrigation potential in the country has been estimated to be 58.46 M ha. For the country as a whole, 66% of this ultimate irrigation potential has been created. However, there is considerable variation from almost full development in Tamil Nadu to negligible in case of Meghalaya. While the Gangetic plains and Eastern coast have achieved a relatively enhanced stage of irrigation development the arid region and the high rainfall receiving areas have a low level of achievement. As of 1st April 2005, there were 221 approved major & medium projects under construction. When completed, these projects would create an irrigation potential of 14.93 M ha out of which 6.80 M ha has since been created till March, 2004.

3.3.2.1 Problems Related to Creation of New Major & Medium Infrastructure

   Irrigation coverage still extends to only about 40 percent of net sown area. Expansion of surface major and medium irrigation infrastructure has been rather slow due to the following reasons:
a) It is increasingly getting difficult to set up new projects that give optimum multiple benefits due to conflicting interests of participating states.

b) Land acquisition is a long process subject to protracted litigation and compensation, when finally decided, is not paid for long periods.

c) Relief and rehabilitation policies have been formulated in the States, but their implementation has hardly ever left satisfied communities due to bad planning, slow release of funds etc.

d) Inter basin transfer of water by linking of rivers has also raised political and hydrological concerns.

e) Just as the share of agriculture in the total gross capital formation has declined in the last two decades, coming down by half from 15.4% in 1980-81 to 7.08% in 2000-01, the share of irrigation also in the total Plan outlays has been reduced from 16.33% in the Fourth Plan to 6.77% in the Tenth Plan. In absolute terms, the position is even worse since the overall Plan outlays have grown substantially and the costs also have gone up.

3.3.2.2 Problems with the Existing Infrastructure: Inefficient, Inequitable, Unsustainable and Conflict Ridden Use of Irrigation Water

a) Large investments have been made and huge infrastructure has been created but this has not translated into “on time” and “on demand” availability for farmers. There has been a wide disparity between design and delivery, inadequate command area development and poor maintenance/rehabilitation resulting in seepages, water logging and salinity in head reaches and poor conveyance in tail areas. Estimates of tail-enders deprivation vary from 7-91% and it is estimated that water use efficiency in canals is not even 40% of the possibility.

b) Large water infrastructure suffers from insufficient soil conservation in upstream areas leading to the problem of silting of the dams, cutting the expected life of the dam. This also implies that there is less water for the second crop (Rabi) as provision of drinking water in cities has the first call on reservoir water.

c) Land gradient & capillary spread of field channels have not got adequate attention leading to poor availability for tail-enders. Small and marginal farmers
suffer more as it is difficult for them to arrange for investment in bullocks/laser machines for land levelling.

d) Political considerations led to proliferation of new projects without adequate attention to completion of on-going projects or maintenance of existing projects. The resources were therefore very thinly spread. Many departments had a very bloated work force often recruited due to political pressures. Staff salaries, especially in the wake of the Fifth Pay Commission, have consumed meagre maintenance budgets. Further, the financial burden of surface irrigation and power subsidies and market borrowings of irrigation Corporations for surface irrigation development have contributed to many States facing crises rendering them unable to spend on maintenance.

e) The inability to charge/raise charge for irrigation water from canals and electricity for pumping has led to a financially unsustainable system. Poor water delivery and reliability have also discouraged farmers from paying up their water charges, thereby crippling Water User Associations (WUA) even where they exist. Recovery of cost is very difficult with departmental rivalry coming in the way of enforcement. Poor recovery coupled with budgetary constraints and poor systems management adversely affect proper operation and maintenance and lead to deterioration of the irrigation systems and threaten their sustainability.

f) Under pricing of water has also reduced the farmer’s incentive to save and use water efficiently and over application of water especially in Punjab has led to water logging / salinity in the head reaches. The under pricing of water has also led to cultivation of water intensive crops like paddy and sugarcane, especially in water scarce areas where they should have been contra-indicative. Coupled with poor targeting of energy subsidy this has led to unsustainable use of ground water in many parts of the country.

3.3.2.3 Multi-User Conflicts

a) Simultaneous existence of scarcity of water and inefficiency in its use remains a paradox. This has also led to multi user conflicts at several levels. The World Bank Draft Report, 2005-“ India’s Water Economy: Bracing for a Turbulent Future” has elaborated the water conflicts at several levels.
3.3.2.3.1 Conflicts at the Inter-state Level

a) In the words of Planning Commission “Inter-state conflicts over water sharing have been the bane of water resources development in the country. Tribunals have been constituted in the past for Narmada, Godavari and Krishna. Tribunals for Cauvery, Ravi-Beas and Krishna (second Tribunal) are presently engaged in adjudication. Although time limits have now been prescribed for Tribunals, still the adjudication process is a long drawn affair. Tribunal decisions are interpreted differently by Co-basin State and this again leads to disputes in operation of the Award”. This has lead to a situation where in most cases there is no clarity about who can use what amount of water. When there are awards they are incompletely specified and have no accompanying enforcement mechanism.

3.3.2.3.2 Conflict between Upstream and Downstream Riparian in Intra-State Rivers

a) Water sharing in closed basins is increasingly becoming contentious within the same state eg. the Viagai basin in Tamil Nadu.

3.3.2.3.3 Conflict within Irrigation Projects

a) An important recent case is that of the Indira Gandhi Canal where the farmers in the first half of the project to be completed were allowed to share the water for the whole project, on a temporary basis, with this water to be gradually reduced to their design share as the other command areas were completed. But this fact was either communicated informally to the farmers or not communicated to all. They thus became accustomed to having plenty of water and planted water intensive crops. When the time came for them to reduce their water to the originally envisaged amount they perceived this as “confiscation” and revolted.

3.3.2.3.4 Conflicts between Farmers and Environment

a) After the construction of the Laava ka Baas Dam a rainwater harvesting structure was constructed in the Bharatpur Sanctuary. Existing farmers claim that they have been squeezed by this and have refused to allow release of water for the Bharatpur Sanctuary.
3.3.2.4 Policy Issues Related with Surface Irrigation (MMI)

3.3.2.4.1 Issues with Creation of New Infrastructure

a) While it is difficult to initiate new irrigation projects quickly a concerted effort is required to expedite ongoing but unfinished projects involving 13.4 million hectare of potential. The AIBP scheme introduced recently is proving useful in creation of new irrigation potential through completion of major and medium projects started much earlier. The Tenth Plan Mid Term Review had observed that the “AIBP is sluggish on benefit delivery. Currently, projects are prioritized on the basis of likely completion time and continue with no further projects financed till selected projects are completed. This allows selected projects to drag and pre-empt resources from other projects. A better priority may be to allocate across projects according to the likely additional irrigation possible from a given investment within given time, without insisting on project completion but with actual benefits monitored directly through remote sensing or otherwise”.

b) Allocation of funds for completing the existing projects should give top priority to projects, which are at the stage of more than 75% completion. Second priority should be for projects in the range of 50 to 75% completion. This would help in ensuring that the benefits of investments start flowing faster. The existing budgets for micro irrigation and repair and restoration of water bodies is extremely small and must be enhanced substantially since such projects would be completed faster and would be subject to less litigation and relief and rehabilitation problems.

c) Inter State rivers lead to legal disputes involving substantial costs and delays. A mechanism should be in position to finally decide Inter-State disputes, which should then be taken out of the purview of Courts, in public interest. Inter-State river water disputes should be handled by the Govt. of India with the setting up of a River Board with statutory powers and comprising of technical experts, stakeholders and States Governments and some eminent persons drawn from media, academics and some economists. 50 years after the passing of the River Board Act, it has not been used even once to deal with inter state river disputes.

d) Proceeds of disinvestment of Public Sector Undertakings could be set apart in a Corpus Fund, which should be exclusively used for ensuring required funds for
irrigation projects. With the assured supply of funds, it should be possible to complete the projects in a time-bound fashion.

e) The main purpose behind large projects is irrigation water for farmers but this leads to the displacement of a large number of farmers in the catchment area raising their discontent. **Prior informed consent** of the affected community should be taken with the help of Gram Sabha/Panchayat before the approval of any new project.

f) Bharat Nirman has proposed to bring 10 million hectares of new area under irrigation. A nationally debated and accepted strategy should be evolved for this.

g) Concept of protective irrigation/localization needs to be revisited to have compact distribution system as irrigation managers have been unable to operate irrigation system as designed. With growing importance given to watershed development, water availability first needs to be established before taking up any new major and medium projects. Several major and medium projects have very limited or almost no inflows.

### 3.3.2.5 Promoting Efficient, Equitable and Sustainable Use of Irrigation Water: Price Initiatives

a) As for subsidies on inputs such as water and power, these should also be viewed in terms of the possible distortions and deleterious effects that they may be causing. For example, over-exploitation of ground water and ecological degradation from water-logging, salinity, etc., due to subsidised or free power or wasteful use of canal water leads to tail ender problems on the one hand and inadequate funds for the maintenance of delivery systems due to negligible user-charges on the other. There are distortions in crop planning too, camouflaging the scarcity of water/energy.
The Energy Irrigation Nexus: Metering vs. Rationed & Flat Tariff Regime

1. Option 1: Metered tariff: Using a metered tariff, a power utility can confidently recoup its costs and supply customers with as much power as they want, when they want it. However, cost and logistical problems with installing meters would be substantial.

2. Option 2: Flat Tariff with rationed supply: The flat rate currently in use is without rationing of supply, which encourages the wasteful use of both energy and water. The switch in approach would involve (1) gradually raising tariffs to cut power utility losses; (2) supplying farms with fewer hours of power per year, but ensuring a quality power supply during periods of moisture stress; and (3) metering at the feeder level to measure and monitor farm power use, to allow good management.

Source: IWMI

b) The supply oriented management regime of canal water regime should have an integral component of demand management encouraged through volumetric supply and pricing of canal water. This is urgently needed to encourage water efficiency and resources for operation and maintenance. On grounds of equity also, surface irrigation and its subsidies benefit medium and large farmers and those in the head-reaches of canals. Distribution of canal subsidies is regressive and a marginal farmer receives approximately one-tenth of the subsidies received by a large farmer. The canal water-pricing regime has to have an appropriate cross-subsidy element, which targets the poor.

c) The National Water Policy, 2002 also provided for setting water bodies initially to cover operation and maintenance costs and gradually charging for capital costs and it was also stipulated that the charges should be linked to the quality of service provided. However, due to the fear of annoying the more influential farmers, most States have not implemented this Policy leading to avoidable burdens on the States’ budgetary resources.

d) Rationalization of water rates and standardizing O&M components is a prerequisite for sustainability of associations. Revenue officers collecting the charges should be sensitized.

e) Financial Sustainability of WUAs is very important. Viability of the users’ organization depends on a large extent on the freedom given to them to fix and collect charges. Government must exercise restraint when announcing waiver of water rates.
Policies adopted by Government have tended to harm the interests of users who promptly pay. The culture to pay for the resource used needs to be promoted.

3.3.2.6 Issues Related to Operation and Maintenance: Irrigation Management Transfer

a) The irrigation water management system has been criticized on account of non-involvement of farmers in decision making at any stage—planning, execution and management. It has been pointed out that without active participation of beneficiaries, the irrigation system cannot be managed efficiently for which sufficient financial support is required.

b) National Water Policy, 2002 had emphasized that the management of water resources should incorporate a participatory approach by involving not only the Government agencies but also stakeholders in various aspect of planning, design and management. Involvement of stakeholders and beneficiaries in design, construction and maintenance of irrigation systems will help in efficient, equitable and sustainable use of water. Irrigation Management could be transferred to WUAs for the distribution of water, setting of charges, collection of revenue and repair and rehabilitation thereby enhancing the efficiency of the irrigation facilities. Recognizing the need for legal framework for Participatory Irrigation Management (PIM), the Ministry of Water Resources has brought out a Model Act to be adopted by the States for facilitation of PIM. Consequently, 10 states namely, Andhra Pradesh, Bihar, Goa, Madhya Pradesh, Maharashtra, Karnataka, Kerala, Orissa, Rajasthan, & Tamil Nadu, have either enacted new Acts or amended the existing Irrigation Act to facilitate PIM. In all, more than 55,000 WUAs have so far been formed in 23 states covering an area of about 10 million hectare, majority of which are under MI schemes. Some of the remaining States have been encouraging participation of farmers in Irrigation Management under Cooperation/Society Act at outlet level. Despite this progress, PIM is not working effectively in all States.

c) Evaluation studies of PIM carried out in MP and AP, which have introduced participatory management by legislation, have shown mixed outcome. Introduction of warabandi, increase in acreage, reduction in theft, timely availability of water etc. have been reported as some of the benefits in these two states. However WUAs are
hampered by political interference, lack of funds, substandard work, poor participation of tenant and women farmers in these two states. Another case in point is the Gujarat example where there is no law for PIM but enabling environment has been created for WUAs to flourish. This was made possible by close co-ordination between the WUAs and the Government leading to the latter creating a facilitating environment, software support provided by NGOs., and freedom of the WUAs in fixing even higher rates. The software support provided by credible NGOs costs a fraction of the investment per hectare for creation of new infrastructure or rehabilitation but helps in establishing and strengthening of the participatory management.

d) In the words of Shri Anil Shah, Chairman, DSC, Ahmedabad, PIM is not a panacea to cure all ailments of canal irrigation. Enabling environment has to be created to make participatory irrigation work.

e) Water availability gap determines how well PIM will work, i.e. with too much or too little water PIM does not work. It works best in areas of moderate water deficiency.

f) For successful transfer of the irrigation management the farmers should be convinced that the canal is theirs and its upkeep is their own responsibility. For this, hand holding after transfer of management for at least five years is necessary. In this context, capacity building of water users as well as staff involved assumes significance. Changing attitude of staff and preparing them to work with users and render technical assistance are necessary. To meet the capacity building needs, WALMIs need to undertake training of trainers and prepare the material required for training. NGOs, working well, need to be involved in capacity building.

g) The other constraints in implementing the PIM effectively like deficiencies in the irrigation supply system, unreliability of water at distributary’s/minor/outlet head, lack of training and leadership and cooperation of irrigation departments need to be addressed adequately. Agricultural extension services should be integrated with irrigation services. Proper roadmap and milestones will have to be devised and rigorously implemented.

h) Enabling legislation is a pre-requisite but without strong political and
administrative will, it will be impossible to implement PIM on a large scale.

i) A project approach, with users’ organization at the primary or sub-system level and federations of user’s organizations at the distributary and the project level will work better.

j) Modifications to and rehabilitation of canal network, providing adequate arrangements for regulating the flow of water and measuring flows at different points are necessary to make them amenable for PIM implementation. Technical problems cannot be resolved through new institutional arrangements. In other words the canals should be handed over only after repair and maintenance work has been carried out at the major level.

k) The Union Finance Minister had stated in the Budget speech, 2006 that “The Ministry of Water Resources will revamp the Command Area Development Programme to allow participatory irrigation management through Water Users’ Association”. For soil conservation efforts co-ordination exists at apex level. However, liaison at ground level is very poor. Water should be released from the reservoir only when required. Transfer of maintenance to the WUA is much better as workers are not engaged when there is no work but canals should be handed over only after extensive repairs. Distributory downwards the operation and maintenance of canal conveyance should be handed over to the farmers. A National Conveyance and PIM Authority should be established. There is an acute problem of waterlogging and nearly 2.46 million hectare of land has to be reclaimed back for cultivation. For this purpose a Land Reclamation Authority should be established.
\[ \\
\]
3.3.2.7 WUAs and Panchayati Raj Institutions

a) In Major and Medium Irrigation, the management is on a hydraulic (canal) basis and not village-wise. In many cases only a part of the village is irrigated. Therefore, organisation comprising of water users is likely to be much effective. Involvement of Panchayats is likely to politicise and complicate the situation. When 73rd Amendment does not include Major and Medium irrigation but Minor irrigation, it may be desirable to have only user organisations and their federations manage water.

b) Panchayats can help Water Users Associations by giving supplementary grants for maintenance in case their resources permit. They can also provide assistance to WUA in any outstanding disputes between them and governmental agencies because of their commanding position in the village society and administrative system. Panchayat’s help can also be sought by a WUA for resolving any outstanding dispute among its members. WUAs can also draw upon the services of Panchayat’s physical and administrative infrastructure for managing their affairs till such time as they are in a position to have their own infrastructure.

c) In order to facilitate interaction between the two institutions it would be useful if a representative of Panchayat is made a permanent invitee to the meetings of the Management Committee of WUAs. Similarly a representative of WUAs should be made a permanent invitee to the meetings of Panchayats. The arrangements can be reviewed later on in the light of the experience gained in this respect. A similar arrangement can be thought of with respect to relations between Zila Parishad (district level Panchayat) and distributory level WUA or a federation of WUAs at district level in case they exist.

3.3.2.8 Pro-poor Transfer of Irrigation Management

a) To make IMT more pro-poor, and to ensure the viability of WUAs, which depend heavily on the labour contribution of small farmers, policy makers should take steps to ensure that poor farmers participate equally in decision-making processes. These steps include raising awareness and access to information, and making the election of WUA committees more competitive and transparent. The relative absence of small scale farmers from committees and general meetings means that they may not gain the crucial benefits that could be realized from IMT.
BOX III

Making IMT more pro-poor

1. Clearly define the rights of farmers. Andhra Pradesh Farmers, management of Irrigation Systems (APFMIS) serves as a good model for this. By law, farmers have equal decision-making power within the WUA, regardless of farm size (i.e., one farm, one vote).

2. Raise awareness, especially among poor farmers. In forthcoming publicity campaigns, state policy makers and the civil service should ensure that farmers understand the IMT process and their rights and responsibilities.

3. Reform the election process within WUAs. This is the single most effective way to substantially improve small-scale farmers’ inclusion in the WUAs. Election of new presidents and committee members should be vote-based rather than consensus-based, to promote competition between several candidates. Ensuring this, and also that farmers are well-informed, will increase transparency and equity.

4. Differentiate between those farmers in the command area who use canal water and those who use alternative sources of irrigation in defining rights. A high proportion of farmers do not use canal irrigation at all (or may use it only in some years)-relying instead on alternative water sources. The management of canal irrigation does affect the availability of alternative water sources, such as ground water and hence the farmers who depend on them, but obviously not to the same degree as farmers who depend solely on canal water.

5. Monitor, by farm size, participation in the WUA (in elections, decision making process, fee collection etc.) Research showed farm size to be a reliable indicator of poverty for intra-scheme comparison. And, data are generally readily available, so that monitoring costs are minimal. Monitoring overtime provides a good indication of equity trends and is a prerequisite for ensuring pro-poor IMT.

Source: IWMI

3.3.2.9 Institutional Intervention for Water Management

a) During the 1970s and the 1980s, the World Bank and USAID invested heavily in creating more than a dozen state level Water and Land Management Institutes (WALMIs). Infrastructure and facilities were superb and things ran smoothly until their funding ended. State Governments had taken over them but due to fund shortages their functioning is reduced to low performance knowledge institution. There is a need to transform the existing water management institutions into world-class institutions for forward thinking research, policy formulation and development. These no longer deliver high-value thinking, insights and perspective. They also fail to deliver the crucial handholding and capacity building support to WUAs.

b) WALMIs have been handled by various departments leading to confusion in methodology/policies. Since this involves the appropriate and conjunctive use of land and water it should be preferably with the agriculture department of State Government.
3.3.3.0 Minor Irrigation Schemes (Surface)

a) Minor Irrigation through surface water covers water sources (tanks and small reservoirs) with a cultural command area (CCA) of less than 2000 ha. According to the census of Minor Irrigation conducted with reference year 1993-94, the number of tanks for lift irrigation schemes was 84,347 and the number of storages for surface flow irrigation scheme 3,08,958. In addition, 83,510 permanent diversions and 83,248 temporary diversions were in existence. Together, they account for irrigation potential of 10.04 Mha or about 10.3% of the total irrigation potential created in India.

b) About 70% of the ultimate potential through surface water based minor irrigation schemes has since been created. Of the balance potential of 5.15 Mha, majority of the area lies in Madhya Pradesh, Andhra Pradesh, Nagaland, Maharashtra and Assam.

c) It may be noted that there is considerable variation from State to State. While full (or even more) potential through minor irrigation has been tapped in Uttar Pradesh, Punjab, Haryana, Rajasthan and some of the Union Territories, it is as low as 17% in Manipur and 20% in Madhya Pradesh.

d) Many currently used tanks in the southern region were constructed in the past centuries. They account for more than one-third of the total irrigated area in Andhra Pradesh, Karnataka and Tamil Nadu. Tank irrigation is less energy and capital intensive and mainly serves subsistence agriculture in a widely dispersed region. It has a special significance to mainly rice growing small and marginal farmers. Tanks also play a vital role in conserving water at a local scale.

3.3.3.1 Decline of Tank irrigation

a) Tank irrigation, which is not only low cost source of irrigation for small and marginal farmers, but also predominantly managed by them, has gradually declined. The Report of the National Commission for Integrated Water Resources Development points out that the carrying capacity of tanks has decreased over time for a variety of reasons and that the restoration and renovation of tanks and other local sources is a priority task.
b) Key reasons identified for the decline of tank irrigation in India are as follows:

i. Encroachment in the tank foreshore and along the feeder channels has reduced supply of water to tanks;

ii. Accumulation of silt in the tank basin/bed has reduced the water holding capacity of the tanks;

iii. The construction of dams/reservoirs in the upper watershed or catchments area has prevented the water supplies from reaching downstream tanks;

iv. Rapid development of groundwater irrigation in the tank command areas has reduced the participation of farmers in tank related works which ultimately reduced the area under irrigation;

v. It has also been confirmed that the poor design of new tanks has resulted in low level of performance;

vi. Inadequate maintenance expenditure by the government coupled with absence of statutory powers for stakeholders to maintain and manage the system is another problem affecting tanks and other traditional irrigation sources;

vii. Break down in village institutions like “kudimaramath” due to caste and other conflict, the community participation which was part and parcel of tank irrigation development has declined drastically;

viii. Crop diversification away from rice mono cropping remains elusive coupled with declining profitability of rice cultivation in many of the minor irrigation projects.

3.3.3.2 Key Issues in Restoration of Tank Irrigation

a) In pursuance of the announcement made by the Finance Minister in the Budget Speech for the Year 2004-05, a scheme for “Repair, Renovation and Restoration of Water Bodies directly linked to Agriculture” has been taken up as a State Sector Scheme. The Pilot Scheme is being implemented through District-Level Implementation Committee with active community participation. The main objectives of the scheme are to restore and augment the storage capacities of water
b) NCF had recommended that the traditional sources of irrigation like tanks, etc. should be preserved and maintained with the participation of local Panchayats and the community. Farmers should be encouraged to use the silt in the village tanks for their own fields, so that they also deepen the dried up tanks during the summer season. New technologies developed by ICAR and other institutes for the purpose should be widely demonstrated and adopted. In this context, nearly 1,000 field demonstrations are proposed to be organized by State Governments. Community surface water storage facilities should be provided to all the needy villages where the piped water supply of the Public Health and Engineering Department (PHED) is inadequate to meet the drinking water needs. With an additional rainwater surface storage of 137 mcm, raising the total capacity to 531 mcm, domestic needs of all arid villages of Rajasthan not covered by PHED could be met. About 70-80% harvesting of rainwater may provide community storage to all.

c) Small water-harvesting and storage structures, with a water spread area of a few acres, are known all over the country under various local names. They usually consist of a bund built along a contour, like a miniature version of an irrigation tank but without sluice gates and canals. For instance, the Kohlis, who are a small group of cultivators residing in the district of Bhandara, Maharashtra, built some 43,381 water tanks over several centuries, which formed the backbone of successful irrigation in the area. So is the community managed Phad Irrigation system that existed in Maharashtra. These should be strengthened and supported.

d) In western Rajasthan, the hub of the country’s arid zone, adopting an integrated water management programme, the “dying wisdom” of traditional system of rainwater harvesting in tanka, nalis, khadins, talab, etc. should be revived and restored. Over time, the capacity of Khadins and other water storage structures have decreased due to land degradation and crop intensification. Improvement of these devices and structures through enhancing and sensitizing group awareness and their
better management are the needs of the hour. Panchayats, Gram Sabhas, community organizations, NGOs and CSOs must play major roles in this effort.

**BOX IV**

**NGO Strategies for Small Tanks**

1. NGOs have placed much emphasis on the variety of roles the small tanks play in their socio-ecologies. As an example, PRADAN operates a rainwater conservation project in the Alwar district, Rajasthan, that aims at reviving the traditional *paal* (bund) system of rainwater harvesting. It has helped village groups build over 110 *paals* in several micro watersheds. PRADAN discovered early, the value of working on a system (or cascade) of *paals* covering an entire micro-watershed. A series of *paals* built in a zigzag manner in a micro-watershed capture and impound the floods flowing downstream, prevent massive soil erosion and greatly reduce flood pressure on the dams constructed downstream. At the same time, they produce dramatic impacts on both farm economies and the hydrology of these areas, mainly by improving groundwater recharge.

2. Tarun Bharat Sangh (TBS) works with *johads* in roughly 550 villages in the Ruparel river basin, Alwar district. Their water-harvesting work covers approximately 6500 square kilometers. This large range makes its impact more visible, and serves as an example for other villages who request for similar work. With a core staff of less than 100, TBS had several hundred volunteers chosen in the villages where they work, and they have evolved into small grassroots organizations.

3. Over the years, they developed a set of norms and rules that are generally accepted; for example, people who benefit have to contribute the labor required. They also contribute some material and cash. TBS tops this up with financial support for the hire of tractors and cement. TBS’s own ‘home-grown’ engineers also provide crucial help in community organization, finding out the needs and concerns of participating members, and designing a structure that addresses these needs. Each *johad* then is differently designed to meet the unique needs of each site and group.

4. TBS’s works are low-cost compared to government structures. A couple of middle-sized *pucca bandhs* (dams) in the village of Bikhampur cost only around Rs. 30000 (US $700) each, besides farmers’ contributions. The same bandhs would have cost around US $ 10000-15000 had they been built by the Irrigation Department.

e) There is some dispute about the desirability of use of low cost check dams etc. for trapping excess water flow during and post monsoon on the ground that this would interfere with catchments of village tanks. It is, however, felt that more often than not water in rivulets/nullahs flows into minor rivers which, in turn, ultimately merge with the sea. Very few of such nullahs/rivulets feed the small tanks and, therefore, construction of check dams is not likely to interfere with optimum catchments of monsoon water in such tanks. On the contrary, such check dams promote ground water recharge, involve low construction cost, require little maintenance and provide opportunity for drinking water for human and cattle post monsoon and also provide opportunity for economic activity like vegetable growing on the sides of the check dam, especially by women groups. Clearly, therefore, the
benefits outweigh the perceived dangers. The efficiency of such check dams in drought prone areas/market areas like Jhabua (MP) has been well demonstrated and appreciated. Check dams, as desirable activity, therefore, should be continued by utilizing labour available under NREGP.

f) The best strategy for rehabilitation is to view tanks as complex socio-ecological systems with multiple stakeholders groups and multiple uses. For each rehabilitation option, policy makers would, of course, have to consider the expected output, the financial investment required, and also the possibility of unrest in excluded parts of the population, and compare the appeal of the various solutions to motivate the farmers and other stakeholders, as members of WUAs, to participate in tank maintenance and water management.

g) Crop diversification with appropriate technological, market and institutional interventions should be promoted.

h) Renovation and rehabilitation of local community based irrigation sources should be made a major component in rural infrastructure projects. Rehabilitation of community irrigation systems should be an integral component of all rural employment generation programmes.

3.3.4.0 Minor irrigation: Unsustainable Withdrawal of Ground Water

a) The era of Ground Water exploitation started in 1960. The major facilitators of ground water usages included expansion of electricity supply (hydropower), availability of credit and cheap technology. Ground water pumping helped in overcoming water logging and salinity. Other advantage of ground water included abundance and timely supply. A major anomaly is that ground water utilization is low in eastern region where it is abundant due to energy shortage.

b) The problem of untimely and unreliable water faced in canal command areas was solved by resorting to ground water utilization by the farmers. But self-provision of water for irrigation and household purposes was an indicator of the failure of public water supply system. Tube well proliferated in canal commands because public irrigation managers were unable to deliver irrigation on demand. Urban household
also relied on boreholes because municipal service was inadequate and unreliable. There is an inherent inequity bias with resource rich farmers in a better position to use the ground water for irrigation and household purposes. Small and marginal farmers are not in a position to carry out investments for exploiting ground water. Easy availability of ground water also allowed farmers to grow water guzzling crops in areas they were contra-indicated.

c) A recent survey by Central Ground Water Board (CGWB) indicates that out of the 7414 identified units (blocks/talukas/watershed), 471 are “Overexploited” and 318 are “Critical or Dark” units. Thus, less than 11% of the total units fall under the category of “over-exploited” and “critical”. It may be noted that ground water is still available for exploitation in the eastern parts of the country, in Madhya Pradesh and Chhattisgarh and in specific pockets of Andhra Pradesh, Karnataka, Maharashtra, and Jammu & Kashmir. In Punjab, Haryana, Rajasthan, Gujarat and Tamil Nadu, the rechargeable quantum of ground water has been exceeded and mining of static reserves has commenced.

d) There is a lack of concerted regulatory policy to restraint the over-exploitation of ground water. Recharge is also not mandatory.

e) Progressive decline of water table has reduced the recharging capacity of dug wells especially in hard rock regions. For newer wells, the farmers have to dig deeper. A competitive deepening of wells leads to increase in cost of water and affects the small and marginal farmers, who own dug wells. In dark blocks, individual farmers are free to exploit further the ground water, thereby adversely affecting the existing wells.

g) For tube wells, there is embedded energy subsidy, which has adverse fiscal implications for State finances. In fact increase in the depth of aquifer leads to rise in pumping cost which, in turn, will lead to rise in input cost(if power is not free) or rise in subsidy costs.

3.3.4.1 Conflict Areas

a) Conflict over excessive ground water withdrawal between indigenous communities and cola multinational has been reported in Kerala.
3.3.4.2 Policy Considerations

a) Utilization of ground water potential is dependent on availability of electricity, which is a major constraint. The quantum as well as quality and duration of the power supply is unsatisfactory and is a major issue, especially since the farmers feel that they are being discriminated compared to the cities where the more vociferous urban consumers get better supply. While additional generation capacity has not been coming up adequately in view of resource constraint in the State Electricity Boards, the problem is made worse by widespread power thefts not only in the rural areas, but by the more affluent city dwellers, especially industries. Instead of relying on the State machinery, the people must be encouraged through financial incentives in reporting cases of thefts and there should be a very prompt follow up for disconnection and levy of very heavy penalties.

b) There is also a great scope for better management of the grid and the distribution network, including zoning, to ensure that the farmers get electricity at set hours even if it is for a restricted period.

c) Since ground water irrigation is mainly through field channels, it is essential that the water supply continue for a sufficient time to compensate for the initial loss due to absorption.

d) The watershed programmes should adopt a million well recharge programme to be linked to a rebate in the rate of interest provided under the enhanced agricultural credit programme, on priority basis.
BOX V

Groundwater Recharge and Rain Water Harvesting in Arid Regions

1. Groundwater recharge must be made compulsory for urban as well as rural settings. Due to negative water balance and higher withdrawals, there is hardly any build-up of groundwater in arid regions. Though starved for water, arid regions also face floods, may be once in 10 years, as recently witnessed in the arid agro ecosystem of Gujarat, which may generate on an average 2100-6200 mcm water. It is estimated that if 1/3rd of floodwater is made to recharge the groundwater, it can sustain five recurring droughts. Ephemeral river water should be used to recharge groundwater through check dams, percolation tanks, sub-surface barriers, sand fill dams, induced recharge, etc.

2. The feasibility of rainwater harvesting through farm ponds in areas with rainfall above 400 mm has been well established. Also, there are many examples of recycling such harvested water for successful raising of horticultural crops. It is estimated that in arid region there is potential of harvesting 70% of rainwater for recycling as well as ground water recharge. Under NATP, seven check dams were constructed in different areas, which led to recharging of ground water, by 80 m in Matyana watershed area of Junagarh in Gujarat. It is claimed that in four years time farmers could reap economic benefits as a result of sale of fruits and crops raised through use of the water for supplementary irrigation. Such “bright spots” should be used for training farmers and extension staff and should be replicated widely by State Governments.

Source: NCF Second Report

e) All the Technology Missions should also contribute to the national scheme to retain, renovate and restore the water bodies that are linked to agriculture.

f) There should be a symbiotic interaction between the National Rainfed Area Authority, the National Horticulture Mission, the Technology Missions and the National Rural Employment Guarantee Programme.

g) Tenth Plan had envisaged community-level investment on artificial recharge of ground water and on rainwater harvesting, and had mooted legislation to regulate groundwater use. If the latter is to extend beyond imposing ban on sinking new wells for regulation at the aquifer level, panchayats will need the power to regulate allocation and pricing of ground water. For this to be acceptable, panchayats must be able to deliver visible gains over what is possible through individual ownership. Besides capacity building, this requires that community control receives more government support.

h) Farmers need technical advice in site selection for borewells, particularly in the Southern Plateau region.

i) A water literacy movement should be launched and regulations should be developed for the sustainable use of ground water.
j) A farmer friendly insurance cover for failed wells is needed for ground water development.

k) There is a need for a Pani Panchayat in every village consisting of the Members of the Gram Sabha who could help in getting the available water distributed on an equitable basis.

3.3.4.3 Integrated Management of Ground Water and Surface water in Irrigated Areas

a) Ground Water Resources within irrigation systems should be mapped and monitored with respect to quantity/ depth and quality.

b) In areas with good ground water resources within irrigation schemes, farmers should be encouraged to sustainably tap these resources.

c) The availability of good quality ground water should be taken into account when allocating irrigation water at system & distributory level.

d) In irrigated area underlain by saline aquifers, irrigation-efficient measures should be promoted to prevent further salinization of fresh water resources.

e) Surface irrigation systems could also be used innovatively for ground water recharge.

3.3.5.0 Rainfed Areas

a) The most important characteristic of the rainfed areas is the extreme variability observed in rainfall both in spatial and quantitative dimension. Most of the rain occurs in 100 hours in a year; frequently heavy rainfall occurs within a short period of time and evaporation exceeds precipitation during most part of the year.

b) Close to two-third of cultivable area, falling in rainfed zone and much of it undulating and hilly, was generally bypassed by the Green Revolution. The yields of the rainfed crops have been stagnating at low levels and huge yields gaps persist. The annual rate of growth of coarse cereal output declined to nearly zero in 1990s. The net per capita availability of pulses has fallen to the level of 1950s.
c) Indiscriminate spread of deep tube wells in the hard rock regions of India has only aggravated the water crisis there. Water tables have fallen precipitously and soil health has greatly deteriorated in the intensively cropped rice/rice systems.

d) The farm sector provides livelihood and employment to nearly three-fourths of the population in the rainfed regions. Not surprisingly, these regions have emerged as concentrations of mass poverty and hot spots for civil strife. A majority of the 200 poorest districts in the country are in the rainfed regions. An overwhelming majority of the scheduled tribes depend on the rainfed farming.

e) Rainfed regions are characterized by great agro-ecological diversity. For example, soil conditions and water availability may vary significantly even within a village in undulating and hilly terrains. The great variation in rainfall across the country is the other well-known source of ecological diversity in the rainfed regions. The undulating and hilly landscapes also tend to be ecologically “interconnected” – what happens upstream affects the downstream and isolated actions bear no results.

f) In his recent inaugural address at the 93rd Session of the Indian Science Congress, the Hon’ble Prime Minister spoke of an “agricultural growth plateau”. He acknowledged that the “technologies and strategies unleashed by the first Green Revolution have run their course”. He spoke of the need for a second green revolution with a special focus on dryland agriculture and small and marginal farmers.

g) Climate changes will significantly impact the environment as well as livelihood and quality of life in resource fragile areas such as coastal, arid and semi-arid regions. While rising seas will inundate and submerge the low lying areas, atmospheric dynamics will subject drylands to even more variable and scantier rainfall regimes.

3.3.5.1 Water Shed Approach in Rainfed Areas for Sustainable Development

a) It was felt necessary to develop a coherent strategy for water conservation and management for rainfed areas. Watershed development programme had been introduced as a strategy for increasing over all development in rainfed areas by increasing the availability of moisture and water. During the Sixth Plan, some model watershed programmes were introduced. The National Watershed Development Programme for Rainfed Areas was introduced on a massive scale during the Seventh
Plan. Water shed approach was and is still thought to be the most appropriate one for lifting the economy of the rainfed areas in a manner that is efficient, equitable and sustainable. While expanding the pace and scope of watershed development, much greater attention needs to be paid on why past efforts have delivered less than promised. Following are some of the explanations offered.

3.3.5.2 Problems

a) There are too many agencies of the Central and State governments implementing watershed schemes. Rainfed agriculture and area development in the country, particularly watershed projects, are implemented by the Ministry of Agriculture, Ministry of Rural Development, Ministry of Water Resources, Ministry of Environment and Forests, Planning Commission and Externally-funded Projects. There have been considerable divergence and overlapping amongst the various projects implemented by different Ministries of the Government of India, let alone any fruitful linkages and synergies among the programmes and projects. This makes a coordinated approach towards prioritised planning and implementation rather difficult.

b) Major problem with the present programmes (such as watershed development) meant for the rainfed areas is that at each level they are administered by people like the Collector/CEO, Zilla Panchayat/Panchayat Secretary who have much else on their hands. The sharp focus needed to implement watershed programmes is often missing because they have many other competing priorities. With many competing priorities and insecure tenures, agency heads cannot follow the endeavour that calls for focused, long-term engagement. The Government organisations at the field level lack the essential technical expertise. Expertise in processes of community mobilisation is also limited.

c) Watershed development is capacity-intensive and inherently slow. The present rate of expenditure of Rs. 5000 to Rs. 6000 per hectare under the Government of India’s watershed programmes does not make for drought proofing. Watersheds also take a long time to fructify. The limit of 4 to 5 years is, therefore, wasteful.

d) Some Watersheds are poorly designed.
e) Most projects do not reach full potential in terms of agricultural production except under initiative and supervision of a few Non-Governmental Organizations (NGOs).

f) In many cases, watersheds have not been properly maintained because community involvement waned after the initial development stage. In any case, community involvement in watershed planning and design has typically been low; and distributional problems are persistent, arising from existing inequalities in land distribution because of ill-defined rights and encroachment.

3.3.5.3 Policy Issues

a) The country is already spending more than Rs. one lakh per hectare for making water available through canal irrigation. Funds should be provided more liberally for watershed programme on more liberal terms for quickening the pace of watershed development and drought proofing. Forward looking comprehensive watershed programmes like the KAWAD watershed in Karnataka provide for Rs. 15,000 per hectare.

b) An abrupt ending of watershed programme in the watershed villages at the end of the project period of 4-5 years is not appropriate for making the best use of the experience and institutions created during the project period due to the following reasons:

c) In the limited period and funds allocation, it is not possible to adequately develop land and water resources of the watershed project area.

d) The social institutions painstakingly built up during the intensive project period of watershed development, have no clear direction and role to continue the momentum after ‘the project period’. Without responsibilities and activities the Watershed Associations and the groups deteriorate and disintegrate.

e) ‘Watershed Maintenance and Development Fund’ accumulated out of people’s contribution, is wasted in absence of clear guidelines for their employment for productive purposes. Such funds in the country are estimated at about Rs. 500 crores.

f) Huge government sums are being proposed and spent on isolated programmes
of large number of such cases. A few examples are development of catchment areas of irrigation projects, scheme of ponds development, horticulture, livestock development, drip irrigation, farm machinery etc. All such programmes are of great relevance and benefits to the underdeveloped areas where the vulnerable communities live which can immensely benefit by incorporating such schemes in their plan of integrated development at the macro level. This could be termed “Watershed Plus” signifying that watershed will not remain an activity focused only on soil and water conservation but should encompass and integrate measures that could increase productivity and provide value addition to the community living in such difficult areas.

g) A more structured and monitorable system with much greater community participation needs to be put in place. There is a need for basic change in the institutional set up in the Government for managing the programme. The National Common Minimum Programme had envisaged that the Government would introduce a special programme for dryland farming in the arid and semi-arid regions of the Country. A National Rainfed Area Authority is proposed to be setup to manage the watershed programme. The structure and mandate for the National Rainfed Area Authority (NRAA) appropriate to the goal of enabling communities living and farming in rainfed areas to achieve Jal Swaraj both in relation to drinking and irrigation water needs is under the consideration of the Govt. of India.

3.3.5.4 Watershed Development Projects and Panchayati Raj Institutions

a) If the objective is poverty alleviation through watershed development, then it is only possible if the watershed dwellers plan, implement and organize together and collectively maintain created assets.

b) The argument that PRIs are constitutionally mandated and therefore should be the only instruments for watershed development is not convincing. Unless the PRI is people-mandated and legitimised, it will only remain an ineffective and toothless structure. If the people through a process of dialogue and consensus decide that their particular PRI enjoys their confidence, then, they will mandate it to implement a watershed project. If not, given that the objective is watershed development, it can be nobody’s case to argue that they should have no alternative.
### Recapitulating NCF Recommendations on rainfed areas in the First Report

**Productivity and Livelihood Enhancement in Rainfed Areas: Towards a Rainbow Revolution**

#### Major Recommendations

1. **Establish a National Network of Advanced Soil Testing Laboratories** capable of testing large volumes of soil samples for 16 macro and micronutrients – 1000 laboratories in all parts of the country, with 500 of them being located in dry farming areas, where there is scope for doubling average yields immediately through addressing the deficiencies of micro-nutrients in the soil, in addition to attending the needs for N, P, K.

2. Highest priority should be given to augmenting water availability by vigorously promoting **rainwater harvesting, restoring water bodies and a million wells recharge programmes**.

3. **Convergence and synergy of all agricultural programmes around a watershed**: We have recommended the formation of a National Federation of Farm Technology Missions which can assist the watershed community to access the provisions of appropriate technology missions like those relating to oilseeds, pulses, cotton, horticulture, dairy, etc. In addition, we propose the setting up at the national level a Commission for Sustainable Livelihood Security in Dry Farming Areas under the Chairmanship of an eminent farmer, who is an achiever in increasing productivity and income per every unit of water.

4. **Lab to Land**: Large-scale demonstrations should be organized on catalytic interventions both factor oriented, such as application of micro-nutrients for improving soil health and implements for improving soil physical properties (soil physics, chiseling and enhancing rain water absorption) and system oriented, such as crop-livestock and crop-livestock-fish integrated systems. These would be undertaken in collaboration with CRIDA and ICRISAT.

5. **Post harvest processing and value addition in collaboration with CFTRI and private sector** should receive priority attention. A post harvest technology wing should be added to each Krishi Vigyan Kendra to bridge the gap between production and post harvest technologies and the KVKs may be redesignated as Krishi and Udyog Vigyan Kendras (KUVKs).

6. **Rainbow revolution** should be promoted in rainfed areas achieving substantial enhancement in the productivity of millets, pulses, oilseeds and livestock through large scale adoption of highly successful new technology packages, such as hybrid pigeonpea. Fifty thousand **Farm Schools** should be established in the fields of farmer-achievers.

7. Create pulses and oilseeds villages (eg. *Arhar Villages, Sesame Villages*) for specialized enhanced production (ensuring full availability of quality seeds and other specified inputs), efficient processing and remunerative producer-oriented marketing of the selected crops as well as the optimization of producing more crops and income per every drop of water by cultivating low water-requiring crops.

8. **Rainwater harvesting through farm ponds for supplemental irrigation and recharging the dead open wells**: In most of the rainfed areas, the seasonal rainfall which comes as downpour, substantial part of that goes waste through runoff causing soil erosion as well as impoverishing the soil through soil erosion. It has been demonstrated throughout India that harvesting of excess runoff and storage into farm ponds as well as restoring water bodies and recharging the dead open wells is a very feasible and successful option for improving the groundwater recharge as well as enhancing the productivity of rainfed agriculture through supplemental irrigation. In the areas with rainfall above 400 mm these technologies could be widely adopted which will enhance the cropping intensity, diversify the system into high value crops, increase the productivity and incomes from rainfed agriculture and at the same time, create assets in the villages. These technologies have shown remarkable increase in the groundwater as well as productivity and incomes for the farmers. The watershed programmes should adopt a **million well recharge programme** to be linked to a rebate in the rate of interest provided under the enhanced agricultural credit programme, on priority basis. All the Technology Missions should also contribute to the national scheme to retain, renovate and restore the water bodies that are linked to agriculture.

---

Source: NCF First Report
c) To conclude, in the words of Crispino Lobo, if done right, with people in the driver’s seat and an enabling administrative and policy environment, watershed development can contribute significantly in meeting the difficulties of the farmers in the rainfed areas and achieving some of the Millennium Development Goals.

### 3.3.6.0 Sea Water

a) The First Report of NCF had made recommendations on enlarging opportunities for sustainable livelihoods based on a pro nature, pro poor, pro woman orientation and strengthening environmental defence systems in the wake of the devastating tsunami in the coastal areas. It was recommended that the coastal bio-shield movement should be initiated along the coastal areas, involving the raising of mangrove forests, plantations of casuarina, salicornia, laucaena, atriplex, palms, bamboo and other tree species and halophytes which can grow near the sea. They will serve as speed-breakers under conditions of coastal storms, cyclones and Tsunami. They will in addition serve as carbon sinks, since they will help to enhance carbon sequestration and thereby contribute to reducing the growing imbalance between carbon emissions and absorption. Mangroves are very efficient in carbon sequestration. They also promote sustainable fisheries by releasing nutrients in the water. In addition, they will provide additional income and make coastal communities eligible for carbon credit.

b) The Coastal Bio-shield can also involve agro-forestry programmes, like the intercropping of casuarinas with hybrid pigeon pea (cajanus cajan) or Red gram, to be undertaken by farming families. Thus, the Bio-shield movement will confer multiple benefits to local communities as well as to the country as a whole.

### 3.3.7.0 Recycled Water

a) Water reuse is already becoming an integral part of water management in many water-scarce areas. For example, it is common practice for farmers in Egypt and North China to place small pumps in drainage ditches to reuse water. The irrigation agency supports this reuse strategy by blending drainage water with fresh water to increase the useable supplies. Millions of farmers in Indo-Gangetic plains employ shallow tube wells to recycle the water that percolates through the soil layer-
effectively capturing and using water before it flows out of the basin. This practice also gives farmers more control over the amount and timing of irrigation applications—with dramatic effects on yields.

b) Many farmers living near urban setting rely on wastewater from cities for their crops. Irrigating with low-quality water is often the only option; but even when farmers do have access to canal irrigation, many prefer wastewater because they are guaranteed a constant supply, and the nutrients the water contains allow them to save on fertilizer. Pollution and health risks should be considered when crafting reuse strategies. The problem is that in many cases reuse is by an unregulated individual or community initiative—often ignored by water management agencies. This leads to suboptimal situations in terms of degradation of water quality, human health, and water productivity.

3.3.8.0 Water Use Efficiency: More Crop Per Drop

a) Getting more crop per drop—improving water productivity—will enhance food security and incomes of the poor in canal, tank command and rainfed areas; will enable us to use the water storages and irrigation infrastructure more efficiently and make more water available for nature, industry and domestic users.

3.3.8.1 Irrigation and Cropping Pattern

a) Regulate cultivation of water intensive cash crops in “dark and grey zones”. All new crop varieties being introduced in the country from any source should be assessed for their water requirement.

b) Research should focus on producing crops that can yield more with less water, withstand water scarce conditions, and thrive on low quality (saline/alkaline water).
BOX VII

Where is More Research Needed?

1. Crop breeding for drought-tolerance, water conservation, and ability to thrive on low-quality water.
2. Understanding the interaction between water management practices at different levels-field, system, basin.
3. Co-managing water for agriculture and the environment.
4. Appropriate pro-poor technologies and practices for improving water productivity at field and system levels.
5. Policies and incentives needed to implement water-saving technologies and practices.
6. How to manage irrigation water for multiple uses-for crops, for domestic use, for other income-generating activities.
7. Tools and models to support responsible decision making for valuing the productivity of water in its various uses and examining trade-offs.

Source: IWMI

c) Agronomists should present their data not just based on productivity per hectare but also based on net income per unit of water.

d) Supplemental irrigation combined with on-farm water harvesting practices reduces vulnerability to drought and helps farmers get the most out of the scarce resources. Priority should be given for in situ moisture conservation like compartment bunding, ridges and furrow, tide ridges, double cropping, strip cropping, mulching and vegetative barriers.

e) Land and water degradation constraint efforts to improve water productivity. Soil erosion, for example, reduces not only soil depth but also its capacity to hold water and the amount of nutrients it contains.
3.3.8.2 Precision Irrigation: Sprinkler and Drip

a) Individual farmers must adopt water conservation and management practices like water harvesting, introducing low cost precision technologies such as laser land levelling and drip etc to match allocation as closely as possible to crop water requirement. Awareness amongst farmers for natural resource conservation should be encouraged.

b) Various forms of precision irrigation- mainly sprinkler, drip irrigation systems can increase yields considerably. In South Asia and Africa, very low- cost bucket and drip sets are offering low cost technological solutions to water use efficiency. They deserve a thought on widespread uptake.

c) Though many States have been facing the problem of water scarcity except a few States, the technology is not popular. 50% of area under drip irrigation lies in Maharashtra. Due to high implementation cost, theft etc sprinkler irrigation is also not popular.

d) In the Vidarbha region of Maharashtra, farmers with the help of NGOs started using pipes and micro tubes to water their cotton fields for a longer time from

boxed text:

**Enhancing Water Productivity and Saving Water and Soil Erosion**

Large tracts of cotton soils, particularly in the Central Zone, are shallow with hardpan at about 8 to 10" depth causing several interdependent soil, water and plant nutrition problems. Breaking the hard pan will obviate the problems in many ways. Rainwater is stored deep, down wherefrom it will not easily evaporate and is available to plants for a prolonged period and a much healthier and larger crop is produced. These reduce the need for irrigation particularly to deep-rooted crops like cotton to as low as 20% of that normally required, and thus the water productivity will increase manifold. But, despite this knowledge and know-how this water conservation technology has generally not been adapted in India. Chiselling (1 m interval) in rainfed areas would need high power prime movers such as 50 hp tractors because of larger draft requirements. Such tractors were not available until few years ago. Presently, both high power tractors and chisel plough are available to do the job. Traditionally, lack of high power tractors, research efforts, and extension efforts did not permit large-scale adoption of the chiselling operation. The cost of chiselling is estimated to be Rs 1000/ha. However, large scale demonstrations of about 100 ha. each in about 200 watersheds in 40 districts should be undertaken to assess the efficacy of the approach in terms of energy, economics and environment. Based on the results, a national plan should be prepared to benefit from the technology.

Source: NCF Second Report
open shallow wells. Most striking was the use of low grade, light weight pipes used for making ice candy locally called ‘pepsi’ which costs less than Rs. 1000/acre as compared to micro-irrigation kits that cost Rs. 12,000/acre and branded drip irrigation systems that cost Rs. 60,000/acre.

e) Cost of micro irrigation systems, which are essential for water use efficiency, could be decreased through abolition of taxes, including VAT. Taxes on use of raw materials for the manufacture of micro irrigation systems should also be substantially reduced.

f) Lease financing for micro irrigation by manufacturing firms to provide credit support, as in case of cars, should be promoted.

g) Full reduction of expenditure for all investments by private sector in promoting dryland agriculture should be provided to supplement Government’s efforts in the field.

h) There should be contracting and sub-contracting of the distribution system in the command areas to bring in greater efficiency in water distribution.

i) Drainage line treatment should be encouraged.

j) Irrigation system needs to be modernized to enable delivery of water on demand basis to farmers through pipes based on crop-water requirements.

k) Since micro irrigation covers only 2.2 million hectares against a potential of 62.5 million hectares, the coverage under this system should be accelerated through public-private partnership.

l) Channels of water from source to field as well as creation of water harvesting facility needs inclusion in the Micro Irrigation Assistance Package.

m) Human resource development, both for farmers as well as for manufacturers, needs to be promoted for optimum utilisation of the potential for micro irrigation.

3.3.9.0 Water Quality

a) Water quality also needs attention since water often gets polluted at sources with pesticides residue and toxic chemicals. Nearly 65% area in Thar Desert has
saline groundwater, having at places fluoride and nitrate levels beyond the permissible limits, thus compelling people to use scarce surface water storage for drinking. Ingress of soil salinity in coastal areas poses yet another serious problem. There is also the problem of arsenic poisoning in ground water. The problem of arsenic poisoning abounds because people residing in regions blessed with abundant surface water such as West Bengal increasingly depend on the groundwater for drinking and irrigation purposes. There is an urgent need to remove this dependency by making available other safe drinking water options – for instance, surface water, which is arsenic free. West Bengal has 7000 cubic meter of available surface water per capita. Effective management of surface water including rivers, canals, water bodies, lakes, ponds and rainwater can reduce groundwater dependency in drinking water and irrigation.

3.3.10.0 Water Markets

a) Analysts believe that the informal water market is growing rapidly, and it may catch up with Rs. 8000 crore organized market of bottled water soon. With ground water getting limited day by day the unorganized water market all over the country has grown. Big farmers or landowners installed tube wells with electric pumps and sell water mostly to marginal farmers for irrigation purposes. The price varies from Rs.3 per hour in the Godvari basin to Rs 45 per hour in parts of Gujarat. The supply of water to tankers for domestic purposes fetches Rs. 200 to Rs. 250 per tanker, which goes up to Rs.400 during summer. Many experts feel that there is nothing wrong in selling water. However, the State should enact law to regulate the market.

b) It has also been argued that introduction of a system of enforceable Water Rights needs consideration. It has been argued that moving towards a formal water entitlement system first requires clarifying that water is publicly owned and that water entitlement is usufructory - it is a right to use, not a right to own water. Further, it has to be related to the sustainable use of surface and subsurface resources. However, in practice it may be difficult because of lack of clarity on who has the right to use what water.
It is felt that water markets are a contentious issue since the fundamental point about ownership of scarce resource of water has not been finally addressed and opinions differ on its ownership by the Central Government/State Government/Local Authority/PRI/ People. The situation is complicated because of imbalance between supply/demand and history is full of examples where a market develops to deal with the situation. Since in practice it may be difficult to formulate and even more difficult to implement a law on the subject in all the rural areas, it may perhaps be best to leave the issue to the wisdom/consensus building at Gram Sabha level.

3.3.11.0 Multiple User Conflict and Conjunctive Use Of water

a) Through years of neglect, the water bodies particularly river systems in the country have faced massive pollution level arising out of increased and unrestrained industrial activity. This has recently affected the fisheries resources particularly in the rivers.

b) There has been inadequate attention to maintenance of water bodies like ponds, floodplain lakes (beels) etc., and even recently constructed reservoirs and ponds/tanks have reduced capacity for stocking of fish due to growth of water hyacinth etc.

c) Multi-user conflicts and excess extraction of water for multifarious uses lead to depletion of fish stocks.

d) There are a few other challenges viz. multiple use of water leading to scarcity of water in future affecting aquaculture activities, large scale diversion and abstraction of water in view of emergence of new river valley projects.

e) Water abstraction owing to construction of dams has resulted in reduced flow affecting the migratory run of fishes. The increased pollution and silt load have further aggravated the problem of water quality and fish carrying capacities. Happiness of fish is indeed an index of the quality of water. Yamuna is highly polluted due to discharge of effluents.

3.3.11.1 Aquarian Reforms

a) The fish farmers are not getting the same concessions in income tax, water
and power tariffs, etc. as the agriculture sector does, although aquaculture is recognised as a part of agriculture, even by NABARD. Therefore, policy intervention is required to treat aquaculture at par with agriculture. Necessary policy guidelines on uniform long term leasing of all suitable water bodies need to be circulated to states/Union Territories for streamlining the efforts to enhance production and productivity through aquaculture. Policy intervention is also required for the effective management of in-shore fisheries and rational exploitation of deep sea, offshore and oceanic fishery resources for the overall development of marine fisheries. Subsidiary industries relating to fisheries like culture of pearls, development of global trade of ornamental fish to provide high-margin business opportunities for fishers, setting up of adequate fish marketing network etc. are some of the other areas which need adequate attention.

b) Fisheries Department must be consulted by the Irrigation Departments of States while managing the water resources, since single-minded attention to irrigation can work to the serious detriment of the fisheries resources. Water allocation policies should be in tune with the biological threshold levels for fisheries so that both the water resources and fish resources could be optimally utilized. In fact even while the Irrigation Department could continue to manage the head works and the canals, the management of the water resource for fisheries in terms of stocking, exploitation, conservation, fishing rights etc., must be under the exclusive control of State Fisheries Department, if the production and productivity of fisheries in reservoirs is to be raised.

c) Water is critical for fish; it has non-consumptive use in fishery sector. It also acts as substrate for its growth and sustenance. Therefore, any water management issue affects fishery directly. The emerging freshwater scarcity needs to be recognized as an issue of utmost importance. There is a growing awareness that increased water use by humans not only reduces the amount of water available for future industrial and agricultural development but also has a profound effect on aquatic ecosystems and their dependent aquatic life, including fishes. Balancing the needs of the aquatic environment and other uses is becoming critical in many of the river systems in the country as population and associated water demands increase. In this context, what is often lacking is the understanding that planning environmental water allocation means
striking the right balance between allocation of water for direct human use and indirect human use.

d) Large areas in the country have suffered from the problem of salinity due to excessive irrigation and inappropriate water management. While these soils have been treated with gypsum to control the salinity, which is costly, a more profitable utilisation of such saline soils can be through culture of Scampi. The technology is indigenously available and the States using the saline soils/water for production of scampi should launch special extension efforts and incentives to popularize freshwater prawn farming.

e) Hills have more water than land. Schemes such as running water fish culture offer great scope and promise in the expansion of aquaculture in cold-water States.

f) Productive utilization of water bodies such as reservoirs, rivers, inland saline/alkaline lands, and waterlogged areas like beels, oxbow lakes and derelict water bodies (At least 75% of the water spread area to be brought under aquaculture in place of the present level of about 40%).

g) There is need for a comprehensive set of Aquarian Reforms in order to foster the sustainable and equitable use of both coastal and inland waters for capture and culture fisheries. Introduction of Aquarian Reforms to help the fishers and the spread of fish enterprises based on the principle of gender and social equity as well as ecology are long overdue, even though concerns have been voiced in various fora over time. These reforms would, inter-alia, consist of leasing policy for major inland water resources like ponds, reservoirs and river system etc, as well as coastal areas for aquaculture, water tariff at concessional rate at par with agriculture, power tariff again at par with agriculture for small and marginal fishers, insurance against accidents/livelihood threatening events, enforcement of close season to permit sustainable fisheries in river system, the reservoirs and ponds.

h) While the elements of Aquarian Reforms are obvious, their implementation over the years has been less than satisfactory for various reasons. It is suggested that the DAHDF should set up a small Committee, which should go into these elements keeping the requirements of gender and social equity and ecology in view and give its recommendations on the lines of land reforms, for adoption by the states after consultation with all stakeholders.
3.3.12.0 General Considerations for Policy

a) The bulk of the investment that has taken place both in the public and the private sectors is accounted for by investment in augmenting irrigation resources: canal irrigation in the case of public investment and groundwater exploitation in the case of private investment. In order to make the investment more productive, it is necessary to invest more for completion of incomplete irrigation projects, better water management in the running projects and augmenting land and ground water resources in the non-command areas through the watershed development approach.

b) Water because of its multifarious uses presents an equally large number of issues and conflicts. Since water is fundamental need both to human life as well as to agriculture including livestock and fisheries, where practiced, public policy has to be designed in a manner, which is not only efficient in usage but also affordable and sustainable. Above all, the policy has to be socially and politically acceptable as well as egalitarian in order to satisfy human and animals needs.

c) Even more importantly, agricultural and industrial growths are interconnected and both target the same resources for water. This throws up important issues of ownership and management of water resources and the irresponsibility of the industry, in view of its large resources, to return the water it consumes in terms of both quantity and quality to the community. Aquarian reforms, therefore, involve a close and sensitive look at the strengths, weaknesses, opportunities and the threats to the water system and arrive at an acceptable policy for harnessing conservation and usage of the most precious resources for life – “water”.

d) Water use efficiency is as important as creation of additional capacity, but insufficient attention has been paid to the dissemination of knowledge for improving water use efficiency and its application on the ground. There is little incentive to follow the improved practices in view of the present management policies and pricing of water. The existing system of water delivery and pricing have in fact encouraged wasteful use of water. Attention should, therefore, be paid on encouraging efficient water use. There should be empowerment of WUAs through devolvement of adequate powers and capacity building at the grass root level. The involvement of farmers in the management of irrigation systems at all levels and with adequate
powers should be actively encouraged, particularly in order to deal with the problems faced by tail-enders in the canal system.

e) Farmer awareness about water and its efficient use can lead to greater sense of responsibility. WUAs should be empowered and could be encouraged to charge and collect water and electricity rates from farmers based on volume of actual consumption or based on quantities of water received or electricity consumed. The collected revenues should be retained by the Associations for maintenance and development of irrigation facilities.

f) Principle of social ownership of water should be accepted and measures should be taken to ensure equitable distribution of water resources. This would require a check on unrestricted exploitation of water resources.

g) Water conservation, equity, fairness, and public good will have to be the basis of water policies. Privatization should not work against the interests of small and marginal farmers. Irrigation policies need to be viewed in a holistic manner and made pro-poor.

h) A new comprehensive Water Law should be enacted for integrated water resources management, dealing with surface and ground water as well as with all aspects of water conservation and usage would be needed to overcome a fragmented approach to water. Multiplicity of laws relating to water has resulted in problems of the enforcement. A new comprehensive enactment will also lead to repeal of several conflicting and redundant laws. Autonomous Water Resources Regulatory Authority at State Level (similar to Electricity Regulatory Authority) should be constituted to look into all water sector issues.

Acknowledgement

The valuable contributions from Dr. K. Palanisami, Dr. Atanu Sarkar, Prof. S.T. Patil, Shri Anil C. Shah, Shri T.B.S. Rajput, Shri A.S. Dhingra and Shri Balmiki Sharma, Shri B. Sharma, Shri Crispino Lobo and International Water Management Institute and the insights gained from discussions during the Consultation on Water Resources held on 22nd March, 2006 are sincerely appreciated and gratefully acknowledged for preparation of this Chapter.
CHAPTER 3.4

GUIDING PRINCIPLES UNDERLYING THE DRAFT NATIONAL POLICY FOR FARMERS

FISHERIES

India is the third largest producer of fish and second largest producer of inland fisheries in the world. It provides cheap and protein rich food and earns the valuable foreign exchange. This sector also provides livelihood to some 11 million people involved fully/partially in fisheries and on subsidiary activities connected with the sector.

3.4.1.1 India has large resources of untapped water bodies which can be utilized by traditional fishers and small/marginal farmers and landless labourers to earn additional income through use of low input technology like use of compost and weeds and use of seasonal ponds, roadside canals etc., NGOs can assist poor and ill-educated farmers through training, micro credit and assistance for marketing.

3.4.1.2 The potential of inland aquaculture can be gauged from the fact that one cubic meter of water can produce about 3 kg. of rice but can produce 6 kg of fresh water fish. The latter uses much less fertilizers too. Fresh water aquaculture therefore has to attract larger funding support specially for feed and technology in the interest of poor for whom it can provide 50-80 % of animal protein comparatively cheaply.

3.4.1.3 The Tenth Plan has already adopted a holistic approach for sustainable development of fisheries and aquaculture for optimizing production and productivity, optimizing the export of marine products, generation of additional employment opportunities and improving the socio-economic conditions of the fisher community with adequate attention to gender issues, and conservation of aquatic resources and genetic diversity.

187
3.4.1.4 Fisheries have been presented in detail in Chapter 3 of the Second Report of NCF. Some of the major recommendations, however, are summarized for urgent attention in the interest of the fishers:

i. Treat aquaculture at par with agriculture in order to provide concession in income tax, water and power tariffs at par with agriculture.

ii. Develop of policy guidelines on uniform long term leasing of water bodies by States/Panchayati Raj Institutions exclusively for Cooperative Societies/Self Help Groups (SHGs) of genuine fishers, especially women.

iii. Effective enforcement of close season for fisheries conservation through provision of financial support of Rs. 1500 per month per family instead of to Rs. 300 per month per family, as at present during the close season.

3.4.1.5 Enforcement of a strategy for achieving the objectives of “Fish for All” by:

a) Enhancing productivity in all inland ponds and achieving sustained high production per cubic volume of water in them; giving integrated attention to capture and culture fisheries both in inland ponds and in coastal areas.

b) Ensuring the adoption of responsible and sustainable fishery practices in the area of marine fisheries and introducing a code of conduct for this purpose.

c) Establishing agro-aqua farms, involving the cultivation of mangroves and *Salicornia, casuarinas*, cashewnut, coconut and other appropriate tree species and the culture of prawns and shrimps.

d) Spreading quality literacy among fisher families with reference to sanitary and phytosanitary measures and codex alimentarius food safety standards.

e) Improving facilities for fish landing, storage, transportation, processing and marketing.
f) **Developing** social marketing techniques, which can help to ensure the availability of good quality aquatic products to resource-poor consumers.

g) **Introducing Aquarian Reforms** to help in the spread of fish enterprises based on the principle of environmental sustainability, economic viability, social, general equity, nutritive quality and food safety. Aquarian Reforms should aim to promote harmony between artesenal and mechanized fishers and Agriculture and Aquaculture and cover both Indian and coastal water resources.

h) **Organizing Fish for All Training Centres** for fisher families based on the principle of learning by doing, to impart latest technical skills ranging from capture or culture to consumption. Helping both resource poor producers and resource poor consumers through sustainable self-help groups is a major objective of the “Fish for All” programme.

i) Specific segments, which have potential for employment and income generation, are as under:

i. Increased exploitation of under utilized fish species

ii. Promotion of:

a. Backyard fish culture

b. Air breathing fish culture

c. Cold water fish culture

d. Running water and game fish culture

e. Fresh water shrimp culture

f. Ornamental fish culture

g. Seaweed culture

h. Artificial Pearl Culture

i. Mussels culture

j. Sea cucumbers
iii. Encouragement of sea ranching and artificial reefs for resource conservation and sustainable exploitation.

iv. Area expansion for semi-intensive brackish water shrimp culture

v. Quality control of seed and feed

vi. Improvement in marketing infrastructure and setting up of cold storages/cold chain

vii. Setting up of Conflict resolution mechanisms with participation of fishermen involved in artisanal and mechanized fisheries.

viii. Technology transfer and awareness generation regarding safety issues amongst fishers involved in marine fisheries.

ix. Technology transfer and awareness generation regarding quality control in fishing operation and landing.

x. More Fisheries harbours/fishing lending centers particularly for artisanal and mechanized fishers.

xi. Provision of Mother Ships, which can ensure hygienic handling of catch in mid ocean and permit longer voyages in the sea by fishers.

xii. Provision of Small dredgers to service fish landing centers and make them more efficient.

xiii. Research, production and wide dissemination of labour saving devices/containers particularly for women involved in marketing/processing.

xiv. Investment in infrastructure for small farmers, aquaculture estates, particularly effluent treatment plant

xv. Popularization of consumption of processed fish to spur demand and to attract large private sector investment in fish processing leading to employment generation

xvi. Research in technology for cost effective and producer level processing and packaging including value addition by fishers.
xvii. Enactment and enforcement of laws to regulate mesh sizes and trawler designs to ensure sustainable levels of exploitation of fish.

xviii. Affordable insurance schemes for fishers in view of hazardous nature of their work.

xix. Preparation of schemes for pension for fishers more than 60 years of age to ensure social security for this vulnerable segment.

xx. Research and production of affordable and efficient fishing boats.

xxi. Effective and regular system of consultation with fishers for polices affecting their livelihood including responsibilities for management of resources like fish landing center etc, which are vital to their livelihood.

xxii. Investment in mother boats to assist fishers in undertaking longer journeys into the sea and maintenance of quality of catch.

xxiii. Promotion of knowledge centers in fishing villages for dissemination of information regarding efficient fisheries practices / weather conditions at sea etc.

xxiv. Infrastructure development in fishers’ villages through utilization of resources in Bharat Nirman for improving quality of life for fishers.
CHAPTER 3.5
GUIDING PRINCIPLES UNDERLYING THE DRAFT NATIONAL POLICY FOR FARMERS

LIVESTOCK

Livestock sector has produced 90.7 million tonnes of milk, 45.2 billion eggs, 44.5 million kg of wool and 2.12 million tonnes of meat during 2004-05. The value of the Livestock output is estimated to be around Rs.165 thousand crores. India, at present, is the first in milk production, fifth in egg production and seventh in total meat production in the world.

Total Livestock output increased at 3.8 per cent per annum during the Ninth Plan, even though it was slower than the 4.5 per cent growth rate during 1980-97. While the growth rate of Livestock has been 3.6 per cent, the growth rate in crop output has been 1.1 per cent per annum only after 1996-97, according to the Mid Term Review of the Tenth Plan.

Further, Livestock production in India is largely an output of small holders and contributes to livelihood of over 70 million rural households. Unlike land holdings, the Livestock holdings are fairly equitable with over 70 per cent of all species owned by smallholder groups of small/marginal farmers and landless labourers. In 2003, India had some 283.4 million bovines, 61.5 million sheep, 124.4 million goats, 13.5 million pigs and 489 million poultry. Even more importantly, Livestock provides a major source of supplementary income for a huge majority of rural households and the sector is therefore, highly livelihood intensive. The sector has provided sustenance to families during drought and other natural calamities.

India ranks first in respect of cattle and buffalos and second in goats, third in sheep and seventh in poultry population in the world and nearly 90 million people work in Livestock sector. The contribution of Livestock sector to the Agricultural GDP has increased from 18.1 per cent in 1981 to 26 per cent in 2004-05. The
contribution of Livestock and fisheries sector in the total GDP during 2003-04 was 6.3 per cent.

Total export earnings from Livestock and poultry related products were Rs. 4734 crores in 2003-04.

Given India’s agro climatic diversity, a large variety of Livestock is available for transportation, tillage, milk, meat, and other by-products, and for providing additional livelihood to the farmers. In particular, Angora rabbits, ducks, turkey quails, parakeets as pets can be bred to cater to the emerging niche markets in the urban areas.

Improvement in Livestock production is an important pathway for increasing the income of marginal and small farmers and landless labourers, given the uncertainties of crop production. Market opportunities due to the anticipated rise in demand for Livestock products, will provide an avenue for resource-poor farmers to increase production, improve their livelihoods, reduce malnutrition and thereby, contribute to the goal of overall poverty alleviation. However there is need to provide an enabling environment in which small producers are able to take advantage of the opportunities, overcome the challenges and meet the threats. Constraints to increased Livestock production will need to be properly identified and addressed.

3.5.1.0 Highlights of the NSS Report No. 493 on Livestock Ownership: 2002-03

a) An estimated 69 per cent of rural households and 11 per cent of urban households operated some land during the kharif season of 2002-03.

b) As many as 79 per cent of rural households in 2002-03 (kharif season) possessed land of a size of 1 hectare or less. About 32 per cent possessed less than 0.002 hectare of land.

c) The cattle population in rural India, which was between 160 million and 170 million during the 20 years prior to 1991-92, declined to 154 million in 2002-03.

d) The buffalo population in rural India continued to grow from 69 million in 1991-92 to 76 million in 2002-03.
e) The stock of *poultry* in rural areas declined from 193 million in 1991-92 to 182 million in 2002-03.

f) The stock of *working cattle* in rural areas declined by 25 per cent between 1991-92 and 2002-03, reflecting the falling importance of bullock power in cultivation and allied activities.

g) The stock of *in-milk cattle* in rural India showed a slight fall of about 2 million from its 1991-92 level of 30 million.

h) The number of *sheep and goats* in rural areas declined from 85 per 100 rural households in 1991-92 to 64 per 100 households in 2002-03.

i) The share of marginal holdings in total stock of in-milk bovines, which was only 20 per cent in 1971-72, continued to rise from 44 per cent in 1991-92 to 52 per cent in 2002-03.

j) The share of marginal holdings in total poultry stock continued to grow from 55 per cent in 1991-92 to 63 per cent in 2002-03.

### 3.5.2.0 Highlights of NSS Report No. 497 on Farmer Households: 2003

a) Tribal farmer households possessed larger number of cattle heads compared to farmer households of other categories. There were 173 heads of cattle per 100 Tribal farmer households. While SC farmer households had 98, OBC farmer households had 126 and the others had 132 cattle per 100 farmer households.

b) While ST/SC farmers had 40 to 45 buffaloes per 100 farmer households, the OBC and Other category had 78 to 80 buffaloes per 100 farmer households.

c) Farmer households in the lowest monthly expenditure class or the poorest category had 31 buffaloes per 100 households, whereas the highest monthly expenditure class had 113 buffaloes per 100 households.

d) Of the average monthly income of a farmer household, Rs.969 came from cultivation. Wage earning contributed Rs.819 while the non-farm business generated Rs.236 and income from farming of animals brought in only Rs.91 per farmer household.
e) About 58 per cent of the farmers kept some kind of farm animals. Households engaged in dairying spent on an average Rs.814 per month on dairy farming. Farmer households who kept poultry spent on an average Rs.129 per month on poultry farming.

The number per 1000 House Holds (HH) reporting owning of Livestock and poultry for each size class, generally declines with the decline in the landholding size, except for bovines. Lower the landholding size, lower is the number per 1000 HHs owning Livestock (Ref. NSSO Report No. 493).

Similarly, the nil category (operating no land or up to 0.002 Ha) representing some 32 per cent of the rural population, shows a steady decline in the number of animals held per 100 HHs during the period from 1971-72 to 2002-03. This seems to be true in respect of almost all species of Livestock and poultry (Source: NSSO report 493) held by them. Labour being the major input of this category of resource poor farmers for Livestock production, the trend perhaps shows that the income from Livestock production looks less and less attractive for them over time.

This category has no resources to improve productivity, no risk taking ability and no good quality animals which could respond to inputs for productivity enhancement. At the same time, poverty reduction requires paradigm shifts through which the under-privileged should be enabled to earn better and gradually grow out of subsistence system through application of appropriate technology, skills, market linkages, information and service delivery systems. The goal should be to support the subsistence farmers to “live” and not “leave”. Unless helped to gradually become competitive through some of the ways listed below, it is likely to become increasingly difficult for them to co-exist/ compete with the commercial type production units. Their number being very large, providing options of employment for this category might remain extremely difficult. Some suggestions in this regard are:

a) Support creation of institutional structures, owned, responsive and alive to the needs of this category. Depending on the local environment, these could be Producer Cooperatives, Producer Companies, Self Help Groups with their Federations, Producer Associations etc. as may be locally suitable.

b) They cannot be expected to leapfrog in to highly productive and profitable systems. However, appropriate support through a multi-agency partnership to function under an integrated umbrella, enabling an economy of scale to ensure viability, may be provided.

c) Market access, being the most important component, may be established for Livestock/ Livestock products, either by equipping these organisations with
infrastructure, capacity and skills, or through suitable linkages or institutional arrangements such as Public-Private Partnerships/Contract Farming etc. so that assured price and round the year market are assured.

d) Their risk-taking capacity being nil, Government may support them through (i) prevention and control of diseases in the form of complete cover in the identified intensive production zone and through isolated number of vaccinations (ii) provide risk coverage under appropriate insurance schemes (iii) build their capacities through extension, training, exposure visits etc. in line with the rate of growth expected.

e) An animal health system, taking advantage of both traditional system of medicine extended by trained Animal Health Workers at the grass-root level and supported by modern medicine, mainly for ailments which are not amenable to traditional medicine, may be introduced, preferably through their own institutions or on public-private partnership. Their economic burden on treatment being very large and unaffordable, the government may financially support them establish such an economically sustainable system, in the initial 5-7 year period.

f) Their institutions may be supported to take up effective breed improvement programmes so as to steadily improve the quality of their animals. To avoid risks, the breed selected for productivity upgradation should match with the capacity building efforts taken up or vice versa.

g) Most categories of resource poor farmers, being dependant on Common Property Resources (CPRs), user rights may be assigned to the community organisations for development, regeneration and use of CPRs for livestock production. In this respect, hundreds of successful examples established on ground with community participation by Sevamandir in Rajasthan, Foundation for Ecological Security, Gujarat etc. in many parts of the country may be documented and disseminated as models for replication. Facilitating a mechanism for effective interdepartmental coordination could reduce undue delays in the process.

h) Commensurate with the above steps, least cost supplementary feeding on scientific lines may be promoted through their SHGs/Associations/Cooperatives etc., always keeping an eye on the cost and incremental earning to the farmer.
i) Through appropriate policies, the private sector could be made to play a partnership role in the process. Keeping in view the economic position of the resource poor farmers, additional inputs and services should only be on the principle of (i) Value addition to result in incremental benefit after offsetting its cost and risk (ii) Government to support such endeavour with an idea to make the system self-sustainable over a 3-7 year period.

j) All these are to be directed in such a way to ensure that the incremental income generated is not only able to meet the costs and risks, but are able to provide a net income attractive enough to retain them in Livestock production - in any case not less than the income opportunity for labour prevailing in the area.

k) It should also lead to a gradual reversal of the growth in the number of low productive Livestock contributing to further degradation of the environment.

l) Given the right support, Livestock production has the potential to demonstrate such growth. Government should make efforts to try out such models on a pilot scale and, once established, widely disseminate and replicate in newer areas.

3.5.3.0 Segmentation of Livestock Farmers

a) It must be appreciated that Livestock in India is highly segmented. A vast majority of Livestock producers come from under-privileged section of rural community and need a Livestock development and research paradigm to achieve sustainable Livestock development. This section represents a sizeable population of rural families and contributes substantial Livestock produce. Livestock are important in their livelihood culture and they have limited alternative opportunities for employment. Studies have shown that development of small holders’ mixed crop-livestock production is one of the most effective methods of poverty alleviation.

b) In contrast, the resource-rich section of the rural population also utilizes Livestock development for optimising their wealth. This section has the means and ability to obtain the desired variety of Livestock and the inputs and services needed to harness them. From the point of view of the national economy as well as exports, output of this resource-rich segment of the population is also important.
c) However, it should be appreciated that the constraints as well as the remedial measures for these two segments have to be different and policies must be clearly targeted in order to be effective.

3.5.3.1.0 Under-privileged Section Scenario

Some of the characteristics of the Livestock production by this category can be listed as under:

a) Livestock keeping is traditional and a part of livelihood system with strong socio-cultural linkage. This linkage has profound influence on production systems but is not given due weightage by research organizations.

b) Livestock are kept with multiple objectives, an aspect which is usually ignored. The main objectives are – meeting family and farm needs, asset building and getting supplementary income.

c) The production systems are highly internalised, based mainly on farm and family resources. Output of one sub-system is input for the other sub-system. External inputs are low.

d) Perceptions of resource poor farmers regarding economics and benefits from Livestock are at variance with classical economic and technical considerations.

e) Indigenous Livestock cow, goat, poultry though considered low producing, are preferred as these niche well with the conditions.

f) Assured subsistence is preferred to risky high production since they have no risk taking ability. High reliability of production is desired.

g) Low producing animal/bird is useful to the family and none of these is non-productive. It is a fallacy to believe that all farmers, poor as well as rich want the same strategy of high value, high inputs including health care and feed and involving high risks in marketing.

h) Families settled in developed areas have adopted more productive animals and practices.

i) Women play a major role in Livestock production and most of them have good knowledge about Livestock behaviour and local feeds. This is usually ignored
by Research Organizations. Extent and nature of involvement varies within and between regions.

j) Adoption of technologies and scientific recommendations is very poor, probably due to lack of confidence in these or most of these are not relevant for the underprivileged.

k) Traditional systems of health and breeding services are commonly used and modern services are either not accessible or not adopted.

l) Traditional animal feeding and management practices are commonly followed and modern ones are adopted by very few. Livestock producers are not fully convinced of the benefits of modern ones over the traditional.

The constraints specifically being faced by the under-privileged Livestock producer can be listed as under:

a) Access to modern Livestock services, especially veterinary services are poor and effective and efficient services are not available. Privatisation of services is not likely to be useful for the underprivileged.

b) Marketing support is poor and prices received for products are low. For example, majority of milk producers get only 50 per cent of the price paid by consumer.

c) Credit support for purchase of animals and its maintenance is not easily available.

d) Goat, Pigs and Backyard poultry are most commonly kept by the underprivileged and these get very little development / research support.

e) Extension/advisory services for underprivileged Livestock producers are not easily available. Extension, concentrates on transfer of Technology – and often works like a postman.

f) Extension officers are often insufficiently informed, not well-trained for the job, lack adequate communication skills and extension material is scarce. Hardly any attempt is made to assess information needs.

g) Appropriate technologies and recommendations for improving Livestock productivity, under systems prevailing with the underprivileged are not available.
Hardly any research programme is developed keeping underprivileged producer in focus.

h) Training programmes are often not practical and provide stereotyped training. Most programmes cover all aspects of animal husbandry and hardly any attempt is made to assess specific training needs.

i) There are very few training programmes planned to suit women.

j) Improved animals that would ‘niche well’ with the systems of the underprivileged and adverse agro-ecological conditions in which majority of them live, particularly the ecologically fragile regions, are not available. There are hardly any programmes to assess their needs and produce or make available such animals.

k) Feed, fodder availability is a major constraint and conventional approach to improve the situation does not work with the underprivileged. Not much work is done for ecologically fragile areas. Developing common property resources needs more of social engineering than technical expertise.

l) There is an increasing reduction in availability of grazing lands due to spread of irrigation and crop cultivation, banning of grazing on lands belonging to the Forest Department and wildlife sanctuaries.

m) Social aspects of livestock-keeping are usually ignored though they have profound influence on the systems.

n) Traditional Livestock breeders have made major contribution to development of indigenous breeds. However, not much research and development effort is planned for them – there is much to learn from these groups on Livestock management under adverse conditions.

The policy for poverty eradication and improvement of Livestock production in sustainable manner would therefore need the following ingredients:

a) A paradigm shift in Livestock research and development programmes, keeping in view the constraints of the poor.

b) ‘Sensitisation and orientation of Livestock research and development planners for taking a ‘pro-poor approach’.
c) Integration of Livestock development should be with crop improvement and Natural Resource Management – development programmes.

d) A system of situation analysis and assessment of needs and constraints focused by the underprivileged in different agro-climatic conditions.

e) Farmer participation on farm research on the basis of adoption of the outputs of technology by the under-privileged.

f) Development of a separate Livestock extension system, which should be pro-active and should assess needs before presenting them to research system and thereafter assess the impact of the research recommendations.

 g) Development of producers’ organizations with full involvement of the underprivileged.

h) Development of common property resources for dealing with seasonal/locational fodder scarcity.

i) A shift from the conventional approach to fodder development through integration of food, horticulture and fodder crops since spare land may not be available for exclusive cultivation of fodder.

j) More research into improved varieties of fodder crops given the soil/irrigation constraints of the underprivileged.

k) More research on socio-economic and production system of small animals like goats, pigs and backyard poultry to benefit the small/marginal farmers.

l) Need to study traditional poultry production system critically and take participatory approach in planning their development. There is considerable scope for their productivity through a sustainable and environmentally sound system, less dependent on costly external inputs.

3.5.3.1.1 Livestock and Environment

a) Thousands of poor farm households in India depend on different forms of Livestock to varying degrees for their subsistence. The role of Livestock in livelihood generation is well recognized. Livestock also play an important role in eco-system protection. Livestock manure contributes to soil porosity, water-holding capacity, soil
nutrient retention capacity and provides a suitable climate for soil micro flora and fauna. However, Livestock if improperly managed can also cause damage to the environment. In the subsistence based Livestock production system prevalent in most semi-arid regions of India, common lands are the primary source of Livestock feed for landless households, marginal farmers and pastoral communities. Forests, pasture lands, nala bunds and roadside plantations are important sources of fodder. However, too large a number of animals on common land can cause intense grazing pressure leading to overgrazing and degradation of the natural resource base.

b) Fuelled by a growing population, rising income and rapid urbanisation, the demand for Livestock products is rising. In the absence of a clear focus on Common Property Resources (CPRs) and fodder and biomass development, increased Livestock production is likely to have negative consequences on the environment (land, water, vegetation, air, and bio-diversity). This ultimately affects landless, marginal farmers and pastoralists who depend on these resources for their livelihood.

c) Some major issues, which need attention urgently, are:

3.5.3.1.2 Shrinkage and degradation of Common Property Resources

a) Grazing is the most important source of fodder for both large and small ruminants. Most grazing takes place in forest areas, non-arable lands, along streams roads, permanent pastures and grazing areas and land under miscellaneous tree crops and groves.

b) Factors that limit access to various resources are:

i. Reduction in land available for grazing and drastic decline in watering points.

ii. Proportional decrease in CPRs in villages and decrease in their biomass potential as traditional systems of collective management of CPRs break down.

iii. Notification of several pasture lands as protected areas which has forced pastoralists to vacate them.

iv. Restrictions on grazing on JFM sites as specified by Forest policies.
v. Lack of engagement of key stakeholders such as government and non-government bodies and institutions in policy formulation

vi. Imposition of restrictions and bans on grazing during watershed interventions and afforestation programmes. If such restrictions are simultaneous the impact on dependent Livestock is disastrous.

3.5.3.1.2.1 Implications

a) Poor availability of fodder leading to uncontrolled grazing in turn resulting in diminished vegetative cover and accelerated degradation through erosion.

b) Loss/lack of access to grazing land

c) Ceiling on the number of Livestock, small ruminants in particular due to social fencing and restricted access to fodder in watershed development programme.

d) Restrictions on common grazing land areas often result in a shift to stall feeding systems. This may not be a suitable option for landless, small and marginal farmers. In addition, women are required to spend extra time collecting and / or cutting and carrying feeding materials for Livestock.

e) Degradation and decline of CPRs make it difficult for the poor and landless to maintain Livestock (particularly local or “desi” cattle and small ruminants).

3.5.3.1.2.2 The Solutions could be

a) Establish productive CPRs in terms of biomass sources that enable people to develop a greater stake in developing, protecting and using them

b) Create a bigger stake for communities (all stakeholder categories including sheep/goat rearers) in the development, management and sustainable utilization of CPRs.

c) Provide compensatory opportunities for upgrading production systems and /or off-farm employment to the affected families in case of non-alternate options for CPRs.
d) Organize primary groups within the Village Forest Protection Committees to democratise the larger bodies and allow room for individuals in decision-making.

e) Hold multi-stakeholder consultations prior to forming User Groups.

f) CPRs should be assigned to User groups to permit scientific biomass/pasture development.

g) Improve the effective role of Panchayati Raj Institutions in Natural Resource Management (NRM), which is currently seen as minor.

3.5.3.1.3 Pollution from Industrial Livestock and poultry production

a) Pollution from industrial livestock and poultry production in the future is going to be a major threat in India, especially in view of the ongoing Livestock revolution. The rapid growth in the demand for animal protein due to the increase in income, population growth and urbanization may cause a quick evolution of the most sustainable mixed farming systems in India giving rise to an industrial production system. Trends reveal that large industrial cattle farms that are not land based are increasing, especially in the urban and peri-urban areas. This may lead to environmental (air, water) pollution, mainly because management of cattle manure is difficult (unlike poultry manure) and easily enters water routes. This is a small problem at the moment but may intensify with time unless control measures are undertaken. This problem can be managed since cattle owners operate on a large scale and will be able to invest in precautionary measures.

b) The poultry sub-sector in India is one of the fastest growing segments of the agricultural sector today. These poultry units are mainly concentrated around urban and peri-urban areas and there is no integration with crop production systems. This causes increasing concerns relating to environmental pollution.

c) The transformation of the poultry sector from a backyard activity into a commercial activity has resulted in the involution of farming systems, causing loss of various breeds of country birds which are suited to backyard systems with low input requirements and low health risks. This has also adversely affected income generation opportunities for rural women.
d) The presence of pesticide and antibiotic residues in Livestock products is also a growing problem in India. Most crops are sprayed with pesticides, which then find entry into animals through crop residues. Similar problems are caused by the rampant use of antibiotics for the treatment of animals. This is a quality and trade issue. As a result of low attention to food safety and quality, Indian Livestock products face difficulties in entering the export market.

3.5.3.1.3.1 The Solution lies in

a) Enforcement of environmental regulations relating to the use of pesticides and antibiotics, disincentives on urban / peri urban Livestock keeping and incentives for crop-livestock integrated farming system.

b) Technological options comprise development and promotion of indigenous breeds suitable for backyard systems, adoption of manure management techniques, which will make them economically viable.

3.5.3.2.0 Resource Rich Section Scenario

a) This section has access to the exotic breeds, high quality feed, preventive and curative health care through paid services from professionals, access to credit, access to organized marketing including export avenues due to their large scale and assured supply of the Livestock product and facilities for providing sanitary and phyto-sanitary certification etc. Most research has gone to benefit this segment, which, in turn, has undoubtedly contributed to growth of poultry and commercial dairying etc. and has led to substantial export earning also. This segment can and would benefit from corporatisation of the Livestock sector through large-scale operations, preventive and curative health measures through production and easy supply of vaccines/medicines, affordable supply of feed, modern abattoirs, better processing and network of cold storages as well as facilitation of export procedures in view of perishable nature of the Livestock commodity.

b) However, even this segment of Livestock farmers / corporates needs several reforms to optimise their performance and tap the domestic and global potential fully. Reforms for this segment would also indirectly benefit the
comparatively better small scale Livestock producers, since there are significant synergies. These can be listed as under:

i. Include meat as an eligible item in Vishesh Krishi Upaj Yojna. Restore APEDA’s financial assistance for upgradation of export-oriented abattoirs/processing plants, which was in force till 2002.

ii. Include buffalo meat under APEDA’s Transport assistance scheme for new markets in Africa/CIS where freight cost from India is much higher than from competing countries.

iii. Restore Duty Entitlement Pass Book (DEPB) scheme for frozen buffalo meat.

iv. Exempt service tax on transportation of meat products processed for exports, especially since this facility is already available for fruits, vegetables, eggs etc. even for domestic consumption.

v. Give special attention to premium priced buffalo-calf meat for niche market abroad.

vi. Concentrate on health of Livestock for abattoirs processing meat for export in order to satisfy the sanitary and phyto-sanitary standards required in EU.

vii. Revamp and simplify the schemes of the Ministry of Food Processing Industries in order to ensure that the flow of financial assistance is in tune with the published provisions.

viii. Ensure thrust on value added processed meat products, so that India could compete in international market where it, even today, has a small presence.

ix. Take up cost effective artificial insemination programme for the resource rich farmers/corporates, involving high yielding exotic breeds, in the Dairy sector.

x. KVKs and private veterinary clinics should deliver quality health services, both preventive and curative, at a cost since dairying for such resource rich producers would be almost a commercial activity.

xi. Large corporates on the pattern of NDDB, should come up in all the parts of the country and should do hand-holding for producers starting with
production to marketing and export, including processing, in the Dairy sector.

xii. Corporates should also need to provide similar hand-holding and go in for contract farming for other Livestock, by taking care of the provision of animal health care and hygiene to assured purchase of the produce of the farmers. They would thus undertake a commercial activity in a decentralized manner, thereby preventing the possibility of large-scale disease infestation in a single farm and also interest people around their processing facility.

xiii. Poultry sector has already seen such examples of large-scale production, leading to a quantum jump in the production of eggs and birds in the country, thereby benefiting the producers as well as the consumers in both urban and rural areas. Organisations like National Egg Coordination Committee have contributed to the setting up of a National Egg Grid leading to well publicized and fairly uniform egg prices etc. Similar initiative would be possible and necessary for other animals in the interest of producers as well as consumers and also in the interest of macro level management of Livestock.

xiv. Eggs could be included in the Mid Day Meal programme in order to push up demand, which in turn could benefit producers also besides meeting the nutritional requirements of children.

xv. Professional Managers specifically for the Livestock sector should be produced and trained to provide management services for large-scale operations in the Livestock sector especially for the resource rich producers including corporates.

xvi. Efforts should be intensified for removal of non-tariff trade barriers for export of Indian milk products and ingredients, especially for SAARC countries and beyond. Joint ventures should be encouraged to bring the technology of large-scale operations and production for niche markets.

xvii. In order to further enhance the potential of Livestock industry, India has to deal with the problem of direct and indirect subsidies and non-tariff
barriers by developed countries, and try for a greater market access to our products and a reasonable degree of protection of domestic industry through enhancement of tariffs to the permissible extent. India also has to guard against several diseases like Avian Flu etc., which can cause immense damage to the industry and farmers. Prevention of such diseases is perhaps the best option and this can be achieved through establishment of several regional testing and analytical labs with latest facilities and scientists, instead of relying on a single laboratory at Bhopal.

3.5.4.0 General Issues

a) A National Policy on Livestock should be formulated keeping the objectives and capabilities of the various categories of farmers owning Livestock. Special attention should be paid to Policy on Livestock Breeding, particularly cross breeding, in order to enhance and sustain the productivity of domestic stock. The Policy should address the entire production – consumption – export chain and should be pro-active, pro-poor and gender sensitive. Simultaneously, the policy should identify methodologies, which could link the poor and underprivileged producers with the more capable farmers and the Livestock industry in a win-win relationship, so that all of them could benefit from the global opportunities opened up by WTO as well as the rising domestic demand for good quality animal products in the wake of our encouraging economic growth and rising incomes in the urban areas.

b) It needs to be stressed that the analysis of the smallholder subsistence system and the resource rich commercial system is a static snapshot of the current situation. However, since economic growth is a dynamic process, the smallholder subsistence system would have to be enabled to carefully graduate on to a resource rich commercial system, since it may not be feasible for the former to continue an unviable existence for long. In the meantime, the smallholder system may have to maintain a mutually collaborative symbiotic relationship with the commercial system.

c) Production objectives of the various categories of farmers must be clearly understood in a participative mode and a strategy for breed improvement, feed formulation; supply of services and marketing etc. should be tailored for these
objectives. A uniform policy for all segments of farmers in all parts of the country may not succeed.

d) Krishi Vigyan Kendras (KVKs) can be and should be a strong tool for providing support to farmers for all aspects of Livestock including marketing. KVKs are perceived to be focusing too much on crops and horticulture and their Livestock component needs to be strengthened through better staffing and tie up with research.

e) In spite of rapid growth of tractorisation and other implements of farming, many small and marginal farmers are not able to afford the cost of purchase and maintenance. Draught animal power, therefore, would continue to be necessary for mixed crop-livestock farming system, which is the preponderant mode in India.

f) Mixed crop-livestock production system is a common feature, particularly for the small and marginal farmers in India. Many of such farmers are turning to Organic farming to enhance their incomes from their smallholdings. Bullock power, therefore, represents a major resource and opportunity. Bullocks provide dung/urine, which could be used by the farmers to enrich their hungry soil and improve the soil structure/health. Enriched manure from the bullock dung reduces use of costly fertilisers and is a critical input for Organic farming.

g) Bullocks can and should be increasingly used in conjunction with farm machinery meant for smallholdings in order to encourage minimum tillage and enhance employment opportunities, while cutting out expenditure on costly tractors/machinery and diesel. At the macro level, this would result in reduced pollution and lesser subsidy bill and lead to sustainable eco-friendly agriculture. Several innovations like Kamdhenu bullock driven tractors have been developed, which can perform a variety of operations at a much lower cost. These technologies would also need to be encouraged for adoption on a larger scale.

h) Cyclical use of poultry/ducks, pigs and fishery particularly in the North-East have proved very profitable and could be popularised all over the country especially where some water is available for fisheries.

i) The requirements of Livestock should invariably be kept in mind while planning for crops in the watershed.
j) Farmer Workshop on Farming Systems should sensitise the participants on efficient use of crop residues for Livestock.

k) Among total population of Livestock, only a fraction falls under the descript breeds for milk and draught purposes. The remaining fraction presently is described as non-descript. There is an urgent need that, some specific breeds should be identified amongst the meat producing species and genetically improved through selection, for further production.

l) Attempt should also be made to select the breed with good performance from the local geography for grading up of non-descript rather than only using the germplasm of exotic or established breed from remote areas.

m) The WTO regulations now expose the small and marginal farmers to global competition. The Government should provide them the minimum protection and support measures permissible under the WTO for poverty alleviation and livelihood protection.

n) Subsidies, though very small compared to other sectors, have been used to support free supply of animal health care, artificial insemination and other services through Government departments. Subsidies have also been used as part of poverty alleviation programmes, to enhance the participation of the poor in Livestock development. However, better targeting and reach of such direct or indirect subsidies in favour of the poor farmers is desirable.

o) It has often been argued that Livestock sector growth in recent decades has been largely a response to the market pull, and that the productivity of subsistence farming system is so low that with even moderate market-stimulus, producers are able to effortlessly raise output and productivity using the inherent ‘slack’ in the system, in the form of under-utilized family labour and crop residues, and with moderate improvements in breeding efficiency.

p) In the States of Bihar, Madhya Pradesh, Rajasthan and Uttar Pradesh, chances are high that large farmers will move out of dairying – which they may find uncompetitive in the absence of a powerful market pull, leaving it to small and marginal farmers. In contrast, some of the better-endowed areas – in the north and the west – will, in all likelihood, emerge as frontline milk-sheds of the country. In areas
experiencing strong ‘market-pull’, mixed farming may weaken and semi-specialised
Livestock farming may increasingly emerge as the dominant mode of organising
production. Private investments in value-adding technologies near the consumer-end
of the production chain would perhaps increase while public and co-operative
investments near the production-end would stagnate. Without early and drastic
reforms in legal framework and bureaucratic environment, many producer co-
operatives may take a beating; and as co-operative and public systems for technical
input supply – such as they are – wilt under progressive resource crunch, there is a
likely emergence of an institutional void in many areas in production support systems
serving small producers. All these changes will bring smallholder Livestock farmer
under pressure. This pressure may ease but only if there are growing opportunities for
off-farm work or for urban wage employment.

q) Like many agrarian countries such as Sri Lanka, Bangladesh and Pakistan,
Indian Livestock product markets are filled with cheaper imports, giving India neither
a global foothold nor a sector that can support livelihood of the rural poor any longer.
It is necessary and important to develop a creative and positive response to this
challenge. Progress and efficiency should not be antithetical to the interests of the
resource poor; indeed, it should be the opposite.

r) Even the resource poor have begun to realize that poor services do not
take them very far even when they are free. They would be ready to pay a reasonable
market price if the service is of good quality. It may, therefore, be desirable to out-
source several veterinary services to the private sector consisting of veterinary
graduates setting up Livestock Clinics. This may be necessary since resource
constraints have prevented the establishment and efficient operation of veterinary
services with full complement of staff in the public sector, to fully cater to the rapidly
increasing number of animals. It would be desirable and indeed cheaper to subsidise
the provision of such out-sourced services to small and marginal farmers. Such a
policy would also spur the employment of Veterinary graduates and lead to an
increase in the number of students opting for veterinary courses in Agricultural
Universities, commensurate with the potential of the Livestock sector in India and its
importance for the mixed crop-livestock farming by small and marginal farmers.
s) It may be necessary for the Government to set up fully integrated pilot projects covering all aspects of the production – consumption - export chain to provide handholding to Livestock farmers. While the Government could take care of credit and risk cover, disease prevention and control, the private sector could take care of AI services and marketing and processing. In this, public-private partnership model, smallholder production could be backed with guaranteed price by the private sector in a win-win relationship. This model could be very suitable for small ruminants, poultry etc. and could be started in districts with potential and could later be up-scaled.

t) Institutional reforms for providing economies of scale to smallholders would be necessary. This could be through cooperatives, self help groups, production companies and public-private partnerships.

u) Government should encourage schemes which cater to production of Angora rabbits in suitable agro-climatic zones and ducks, turkey, quails and parakeets as pets for supply to the niche markets emerging in the urban areas due to rising incomes. Such production should be generally encouraged in areas around the cities and near roads in the interest of logistics.

v) Since 16.6 per cent of rural households have up to 0.01-hectare land holding, Livestock would have to be the major source of income for them as their incomes from crops are likely to be negligible. Similarly, 58 per cent of rural households have land up to 1 hectare and this large target group can supplement its income through Livestock.

w) Priority should, therefore, be given to marginal farmers producing coarse grains in different areas. Since coarse grains may not be very remunerative in the market, it could be used as low cost feed for Livestock. The targeted farmers should be provided a mix of Livestock, cattle and poultry after consultations and in a participatory mode through loans on concessional interest of 4 per cent and with a maturity period of five years and a moratorium of two years in view of the gestation periods involved.

x) An yearly review should be prepared cooperatively by the Government department and the target group to quantify the income generated at the farmers’ level through the supply of Livestock.
y) It needs to be stressed that progress should be measured in terms of rise in the income of the farmers and not merely through macro-level production/export statistics.

3.5.4.1 Policy Initiatives Needed

a) Transform the national and global market pull into an engine for generating sectoral and national competitive advantage, and create conditions which propel and enable sectoral decision-makers to creatively utilise the opportunities offered by the new economic environment to establish competitive advantage not only at the farm-level but also at industry and sector levels, making India a leading player in global Livestock product markets through sustained and all-round improvements in quality and efficiency.

b) Enable the small producers to participate in the process of Globalisation, and to promote institutional and technological change that will enable resource poor households and women throughout our countryside, but especially in the agriculturally backward and poorly endowed regions of the country, to gainfully participate in the processes of growth and modernisation of the Livestock sector.

c) Ensure the ecological sustainability of Livestock sector growth and modernization, that is, to constantly monitor the environmental impact of the new market-induced growth processes in the Livestock sector, and design programmes and policies to effectively mitigate their adverse ecological impacts.

d) The thrust of the Government policy should be to remove all impediments in the way of achieving such competitive advantage through changes in the legal and regulatory framework, and through a policy and institutional environment that promotes productivity, excellence and competitive advantage. The central thrust of the Livestock sector policy should be to generate a strong market pull, which will facilitate this transformation.

e) Globalisation and marketisation creates phenomena of islands of high-tech, capital and input intensive, market-oriented production systems flourishing near processing plants, while the majority of rural households continue to pursue traditional systems. While the market takes care of the growth and competitiveness, government policy must focus on strategies to prevent exploitations and unsustainable
practices, and to integrate the small producer to the larger process of sectoral growth, in a win-win mode.

f) A real danger of market-led approach is that firm-level interests often acquire priority over sectoral and national interests. It is entirely possible that a handful of manufacturers and processors, especially with global linkages, are able to take full advantage of the liberalised regime and create pockets of excellence and competitive advantage while the rest of the sector languishes. As the custodian of the sectoral and national interests, the prime role of the Government is to shape the market pull to serve the sectoral and national interests. In order to take maximum advantage of the ‘market-pull’ for lifting the sector up by the bootstraps, it is critical to promote supportive institutional frameworks and operating mechanisms.

g) The Government needs to devise specific policies and programmes to enable and encourage small holders - the main actors in Indian Livestock production - to progressively approach global levels of efficiency and output. This would involve, among other things, promoting diversification in agriculture through access to better quality - rather than subsidized - credit support, information and technical support needed for them to exercise options for diversification, extension support needed to optimise resource use, and, in general, to help small holders to pull in the inherent slack in the system to their advantage.

h) Finally, a big area for aggressive experimental and promotional work is the organisation of smallholder livestock production. Throughout the world, the modernisation of Livestock production is accompanied by major reorganization of production. There are currently a large number of small-scale, mostly subsistence production units producing for the market. In essence, in this process, the subsistence farmer is joined by entrepreneurs who profit from pursuit of productivity growth. This is essentially how modernisation produces growth. In India, we have seen this process occurring in the poultry sector in the past decades, resulting in a bi-polar production organisation. On the one hand, we have a small number of large, very efficient producers and on the other; we have a vast backyard sector with low productivity and no market orientation. Given time, the globalisation could produce similar centralising tendencies in other livestock systems as well. Public policies must make this process as pro-poor and gender-sensitive as feasible.
A recent World Bank study has examined the drivers for pro-poor growth and has recommended (a) give priority to diversification, both to high value agriculture and a dynamic non-farm sector, increasingly linked to agro and urban industrialisation, (b) shift emphasis to less favoured areas, which may now and in future provide higher returns in terms of both growth and poverty reduction.

It is critical that Livestock researchers understand how livestock systems are changing, whether in the systems in more marginal areas or, in the rapidly changing systems responding to market demand for livestock and livestock products. Secondly, within different systems, it is important that a mixture of technology, policy and institutional innovations be combined if sustainable and equitable livestock sector growth is to be achieved. Thirdly, beyond broader livestock sector growth, specific attention will need to be paid to how the poor can benefit from the emerging opportunities. This will not happen without targeted and intelligent public sector research and development action.

Livestock policies would be more pro-poor if they include strategies for (i) establishing the basics for livestock production through secure and adequate access to inputs like land, feed, and water as well as risk-coping mechanisms for natural disasters and price shocks, (ii) kick-starting domestic livestock markets to promote a pro-poor credit market and efficient, pro-poor system of animal health and extension service and adequate access to output market for small holders and (iii) supporting and expanding livestock markets through encouragement to sustainable production of high quality commodities, research for feed and breeds, environmental protection, food quality control, certification and grading to enable the products to be competitive in international markets and to avoid small holders being crowded out by foreign competitors.

3.5.5.0 Genetic Improvement

a) There is urgent need to establish scientific genetic improvement programs (and strengthen existing programs) for all important indigenous breeds of large and small ruminants (including cattle, buffaloes, goats, sheep, camels) and poultry. This will help in achieving the dual objectives of breed conservation and genetic
improvement. In such programs, emphasis should be placed on accurate genetic evaluation using modern statistical methods.

b) Existing Government programs have generally not been successful in producing large numbers of improved Livestock germplasm. Therefore, the private sector should also be encouraged to establish breeding programmes with appropriate breeding objectives.

c) Breed improvement programmes may be based on field recording/progeny testing of animals maintained at the farmers’ level. Improved progeny selected through field recording should be used for future breeding programmes.

d) Scientific selective breeding programs also need to be established for crossbred cattle with different levels of exotic breed inheritance.

e) Only progeny tested ‘proven’ bulls which are the product of scientific breeding should be used for semen production.

f) Large corporates on the pattern of NDDB should come up in all parts of the country which should do handholding for producers starting with production to marketing and export, including processing.

g) Most of the economically important characters in farm animals like milk production, rate of gain (growth), efficiency of gain, carcass quality, etc are quantitative traits. These traits are controlled by a large number of genes, which may act adaptively, multiplicatively and interact epistatically with each other or exert dominance. Identification of quantitative traits and exploitation of these polygene characters using biotechnologies has immense potential.

h) More research inputs based on farmers’ feedback and requirements of different soil types/fodder availability and costs would be needed to cater to this requirement. In particular, the opportunities of fodder by indigenous breeds should also be tapped, in view of their hardiness and adaptability.

3.5.6.0 Dissemination of Genetic Improvement

a) All semen production stations need to be monitored strictly to ensure that they follow the guidelines laid down by OIE and maintain high standards of quality control at all stages.
b) Quality animals are not available in adequate numbers and are also dispersed leading to inefficient supply chain of frozen semen.

c) Inadequate facilities for production, maintenance and supply of frozen semen hinder insemination in far-flung areas. There is insufficient involvement of the private sector and trained rural youths in the task of providing artificial insemination facility. The service covers only some 20 per cent of the breeding females among cattle and in not even 5 per cent of buffalo; the conception rate to AI is less than 20 per cent. In short, the quality of AI services in India is very poor.

d) 100 million doses of semen must be made available in a year to inseminate the cows and buffaloes for breed improvement and sustenance of milk production.

3.5.7.0 Research and Training

a) Livestock vocational training at district / divisional /agricultural university level needs to be started to prepare Para Veterinarians.

b) Curriculum for Para Veterinarians should be standardized and should be supplemented through attachments with Institutions/Governments/NGOs for supplies, support, supervision and quality control.

c) Veterinary colleges in the Agricultural Universities should receive greater focus and funding to come up with digital Extension Content development so that farmers can access the required information through IT network.

d) There is need to undertake progeny testing programmes, since there are virtually no testing bulls available and good genetics require use of biotechnology techniques.

e) There is a need to set up a system of animal registration and performance data recording. Good work has been done in this area by Maharashtra Animal and Fisheries Science University, Nagpur, and needs to be replicated.

f) There is a need for creation of a Regulatory Authority of animal breeding quality assurance, which could consider and decide on issues relating to artificial breeding services in rural areas.
g) The current ban on importing semen and embryos should be considered for relaxation under regulated conditions, since it would require a decade for progeny selection of bulls and till then we have to depend on imported semen and embryos.

h) Progeny testing programme would involve testing potential bulls for genetic disorders and production potential with the help of gene markers. This could be attempted afresh through setting up of well-equipped biotechnology centres in each State, which could run on commercial basis. In view of importance of buffalo in India and its well-known capability, there is a need to formulate buffalo semen production protocols and develop Hazards Analysis Critical Control Point (HACCP) standards for semen supply to rural areas.

i) To promote livestock marketing access to farmers, Maharashtra Animal and Fisheries Science University, Nagpur has developed a web-marketing platform at www.pashubazar.com. This initiative also needs to be replicated so that rural Agri-business centres, veterinary dispensary, Dairy Corporation and rural cyber café could provide franchise Livestock marketing services to farmers. The site can also be used for sale/purchase of farm equipments etc. Animal health and productivity services at veterinary centres are becoming redundant in view of absenteeism and logistic problems in carrying sick animals to the centres. Farmers now request door service, provided quality inputs are made available. The farmers need assured services for Livestock purchase, genetic improvement, and breeding and production improvement consultancy, and feed diagnostic approval services. There is a great scope for privatisation of such services through trained veterinarians on the pattern of Agri-clinics. A franchise approach with mechanism of cost recovery would be desirable.

j) Promote Institutions and establish mechanisms to ensure quality consciousness in milk, meat, vaccine and other products of this sector, encourage research and innovation, and to enhance sector level efficiency in quality production, value addition, procurement, processing, storage and marketing of all Livestock products.

3.5.8.0 Breed Conservation

a) In recent years, a widespread consensus has developed that the best way to conserve breeds is to facilitate the maintenance of them as part of functional
production systems and in the social and ecological context in which they were
developed and continue to develop. Thus community-based conservation of Livestock
breeds should be encouraged and supported.

b) In order to protect the local breeds against indiscriminate cross-breeding
with exotic species, it would be necessary to set up Living Gene Banks for local
breeds like Rathi, Bhadawari etc. The existing Suratgarh Farm could be used for this
purpose. However, supporting low input smallholder systems is a more promising
approach to biodiversity conservation.

c) There is need to have some kind of control on breeding of small ruminants
in the villages. Forming ‘User groups’ in the villages might help in doing this. The
farmers in one or more villages may form such ‘User groups’. The ‘User group’ may
decide to keep certain breeding males and those could be used on payment basis.

d) In comparison to many exotic pure breeds and crossbreds, our indigenous
dairy cattle, like Haryana and Sahiwal, also known as Brahmans abroad, show a
greater degree of heat tolerance with minimum loss of body weight during exposure
to stress, nutritional deficiency and transport, as well as low mortality rate and good
reproduction rate and longevity. Similarly, the Indian Red Jungle fowl (Gallus
gallus), Frizzle fowl and Naked neck fowl are better known for heat tolerance quality.
Among the different genetic groups of sheep, Malpura and Chokla show a greater
degree of heat tolerance value.

e) Accreditation of indigenous breeds by State Governments by way of
registration is warranted. The registration programme should be expanded for all
breeds and strive to identify animals with higher productivity. State Governments
should carry out field recording of performance of the animals with help of other
agencies and State Animal Husbandry Departments. NGOs should be encouraged and
given incentives to start this kind of work.

3.5.9.0 Gender Issues

a) There is a variation in the extent and nature of the involvement of women
in Livestock management as well as their perception, knowledge and views between
regions and socio-economic strata. Despite variations, women mostly handle aspects
like milking, care of young and sick animals, cleaning and feeding. This is significant for design of extension and training strategies.

b) Consequently, training and extension programme in Livestock need several changes. Prevailing illiteracy, household responsibility leading to limited time and mobility and women’ priorities and felt needs should be considered and provided for, in gender focused programmes for their training.

c) Women’s knowledge of animal behaviour, feed resources, useful medicinal, fodder plants and bushes etc. should be developed and utilised.

d) Since women generally attend to most of the activities relating to feeding of animals and milking as also primary processing of milk products such as curd and butter, there is need for dissemination of knowledge to them on aspects of better feeding and maintenance of Livestock and disease control.

e) More research is needed for equipments, which could reduce the drudgery of women in handling of Livestock and processing of Livestock products.

f) More mentoring is needed for women’s self help groups so that they could be more efficient in handling their Livestock wealth and for improving livelihoods.

3.5.10.0 Problems of Small Ruminants

a) Small Ruminants contribute about 10 per cent to the total value of Livestock sector but receive only 2.5 per cent of the public spending on this sector. They account for 14 per cent of meat output, 4 per cent of milk output and 15 per cent of hides and skin output. Goats are widely distributed in various agro-climate regions but have special significance for West Bengal, Rajasthan, U.P., Maharashtra, Bihar and M.P. Sheep density is the highest in arid and semi-arid eco system and they have special significance for nomadic communities and in A.P., Rajasthan, Karnataka, Tamil Nadu, J&K and Maharashtra. In general, the small ruminants make an important contribution to the sustenance of small and marginal landholders and the landless.

b) The critical issues for this sub-sector are poor awareness regarding their importance in the livelihood system, lack of active rearer organisations, pressure on fodder resource base, inadequate veterinary health services, lack of focus on genetic
improvement, reduced access to credit and insurance, lack of efficient market mechanisms, and poor inter departmental coordination.

c) The approaches to these issues would consist of development of multi stakeholders platforms for knowledge sharing and inter-departmental coordination, promotion of gender balanced, small ruminant, rearer organisations, capacity building of rearer groups, mechanisms to improve veterinary health services, institutional arrangements for improved access to credit and insurance, selective breeding for breed improvement and systems to improve access to remunerative markets. It would be useful to set up a pilot study to understand the balance between stocking rate and biomass availability.

d) There is an urgent need to have some kind of regulation and proper marketing policy for small ruminants and their products. The policy should also focus on export requirement. For this, regional goat/sheep Marketing Boards may be constituted. The boards should ensure quality standards and remunerative prices for producers.

3.5.11.0 Problems of Organized Dairy Marketing

a) There are 100 million farm holdings in our country out of which at least 5 million holdings should be motivated to establish organized dairy units which can be monitored and linked up with modern amenities of bulk cooling, refrigeration, transport, storage and processing of surplus milk into products.

b) The latest techniques such as use of BST (Bovine Somato Tropin) and ET (Embryo Transfer) etc. have not been applied to its full potential, which should be made available to farmers at a reasonable cost to increase the production by 20-25 per cent.

c) There are many villages having the potential for milk production but not covered in Operation Flood (OF) programme. For example, the percentage of villages covered by OF in UP, Rajasthan, MP, WB and Bihar was 21, 15, 9, 5 and 9 per cent respectively. Out of 168 Milk Unions, 119 Milk Unions (70.8 per cent) are running in loss. The major causes, which may explain the closure of societies/unions are : i) active price competition with informal traders especially in the villages around cities, ii) single milk collection point: this increases travel time and waiting time, iii) village
politics, iv) dishonesty, v) Alternative opportunities like soybean cultivation (in Madhya Pradesh) provide higher income than dairying; and also fewer by-products for cattle feed than the cotton and groundnuts they replace, vi) rejection of the Anand principles of farmer control in many States, vii) under-utilization of processing capacity in some of the loss making unions resulting in high overhead cost and huge interest burden to these unions, viii) milk unions fail to dispose of all milk collected during the flush season through their own channels or the National Milk Grid. As a result, they are compelled to convert the surplus milk into milk powder and butter oil to be used only in the lean season. In this process, a large sum of the milk union’s money is blocked and creates a shortage of working capital which further leads to non-payment to milk producers, a major cause for poor procurement performance of many loss-making unions.

d) Among the loss making unions, 22 dairy cooperative unions have the capability and the potential to become self-sustaining entities in time. Their performance has been mainly constrained by insufficient growth in milk procurement and marketing. They can effectively turn themselves around through appropriate interventions and many of them have already initiated steps to do so. 44 cooperative milk unions/federations have suffered losses due to internal factors such as lack of professional management, overstaffing, poor capacity utilization and external factors such as the negative impact of government pressures to increase milk procurement prices, withhold upward revision in sale prices, increased competition and restrictive cooperative legislation. Their turnaround seems possible with the infusion of external financial assistance since they are endowed with significant procurement and marketing potential. It is necessary to put in place a mechanism that can regularly collect reliable data on the performance of the organized private sector dairy industry of the country to enable the cooperatives to compete with private companies.

e) The crucial agenda is to devise ways to ensure that the sector globalises in a participatory format; that it grows fast but with active and gainful participation of the resource poor and women throughout India. And, in achieving this aim, strong producer co-operatives can be the best possible answer.
f) It is certainly necessary for the Government to take initiative not only to radically reform the co-operative act to facilitate business performance and concerned success but also to turn the dairy co-operative movement over to its members.

g) As an organisation, which has steered India’s dairy development over the past three decades, the NDDB is in many ways best placed to lead the globalisation of Indian dairying. To do this, it needs to redefine its charter: it needs to swiftly remove the bugs from the Anand pattern so that at least half – but preferably many more – of the co-operative unions put their act together for the global market place: it then needs to lead the co-operative dairy sector to the global platform by a series of swift and proactive moves to set up plants in several Asian countries. While in their current State, producer co-operatives face many odds against national and global competition; their unique potential strength is in the area of quality. Dairy co-operative members are accustomed to supplying milk on the basis of fat and SNF tests for decades, but attach little or no premium on bacteriological quality. This cannot be said about a majority of private operators even in the organized sector, leave alone the informal sector. If India has to meet high quality standards that global competition will imply, co-operatives will find it the easiest to meet them, especially if they can translate better quality into higher income for their members.

h) The co-operative sector’s other major strength is the NDDB, with its technical, managerial and marketing capability and its ability to build farmer-to-farmer alliances in other countries. Keeping these in view, the NDDB should aggressively seek and establish an early foothold in overseas markets. The Government can assist the NDDB to perform this role in a number of ways but firstly by making the changes necessary in the legal and regulatory framework so that the NDDB-supported co-operatives can operate freely as farmer owned businesses.

i) Use of synthetic milk should be banned in view of health hazards and in order to enhance demand for genuine milk from the rural areas, which would in turn mean higher incomes for farmers.
BOX-I

Poultry Farming

Poultry farming has become one of the fastest growing sub-segments in the agricultural sector. Poultry industry contributes Rs. 35,000 crores to the GNP and provides employment to over 3 million persons, and is the only segment of the Agriculture economy, which is growing at about 17 per cent per annum. Some of its features are:

a) It is an efficient converter of maize and soyabean into nutritious animal protein feed.

b) Poultry litter is excellent manure, containing 4.8 per cent nitrogen, 2.8 per cent phosphorous and 2.3 per cent potash. 40 birds kept in deep litter for a year can produce one tonne of manure to fertilize one hectare of paddy or maize, two-hectare sorghum or half hectare of intensively cultivated vegetables.

c) Poultry farming is labour intensive, needs comparatively little capital and provides quick returns. It has great potential for non-farm employment and for retardation of rural migration.

d) India with its strong agrarian base and favourable climate is a highly economical location for poultry production.

e) Forward looking private companies like Shri Venkateswra Hatcheries have contributed substantially to breed improvement and spread of poultry farm through a package of services. Similarly, a consortium of private stakeholders has self-regulated the industry and performed substantial marketing functions through the National Egg Coordination Committee. Such initiatives are unique to poultry in the animal husbandry segment.

Problems

a) There is a severe shortage of major feedstuff viz. maize, which accounts for 50 per cent of all feedstuff and 75 per cent of the total cost of production of eggs and boilers. Profitability of the sector, therefore, is highly sensitive to price fluctuation in maize.

b) There is a substantial infrastructure constraint for storage, distribution, marketing and export including a shortage of refrigerated road transport and efficient cold chain. In addition there is a shortage of a proper testing system and hence pesticides/anti-biotic/hormone residuals cannot be tested sufficiently to meet the requirements of the exporters.

c) Even though poultry sector is a sub-segment of the agriculture sector, it is subject to restrictions on use of agricultural land and also attracting high electricity tariff and sales tax and is also subject to different land and labour laws compared to Agriculture based industry.

d) Poultry industry faces a dangerous future due to the threat of totally unrestricted free trade and the challenge posed by producers like Brazil with their low prices for “whole chicken/chicken products” in view of their large farms. India is ranked number one in competitiveness for egg production and number two for chicken production.

e) The threat due to lower prices of chicken meat is also due to the fact that “chicken legs” considered as delicacy in India are treated as dark meat and dumped at a low price by foreign countries in India. EU and US provide large subsidies to their farmers and the prices of maize there also are lower leading to cheaper feed prices.

Mention however, must be made of the threat posed by unknown and known diseases like Avian Flu through H5N1 and other viruses, through imports. Such diseases can cause extensive damage to health of flocks and the economy of farmers. Above all, it can cause a substantial reduction in demand for poultry and egg causing steep fall in prices. The best option is to prevent such diseases through establishment of testing in analytical laboratory at important ports and facility for quick analysis, quarantine and deportation. While import of vaccines for H5N1 virus is banned, it is felt that the ban should continue, because we do not have the facility for check of isolation and testing of the vaccine. H5N1 is an unstable, mutating and very fragile virus and the entire issue of the need desirability and implications of vaccination should be thoroughly studied by a team of scientists.

Source: Dr. Anuradha J. Desai
j) In US and Europe, consumers prefer the breast and breast meat of chicken, as it is considered as “white meat” or lean meat. The legs, which are considered as dark meat, or red meat, have no demand there. Due to the strength of export subsidies chicken legs were exported by US to Philippines and Sri Lanka at ridiculously low prices, thereby ruining thousands of poultry farmers in those countries. If chicken legs or legs meat is imported into countries like Sri Lanka and Nepal which have Free Trade Area (FTA) with India and re-exported to India, after a token value addition – at zero duty under the FTA - that could cause enormous damage. Therefore, the extreme cautions and vigilance are necessary to ensure that prescribed value addition norms should be strictly adhered.

k) Our layers yield a Hen-Housed production of 320 eggs; and our broilers attain a bodyweight of 1.7 kg in 37/38 days with a feed conversion ratio of 1.7 – and that too, with a feed containing 2800/2900 kilo.cal energy, as compared to 3200 kilo.cal in USA/Europe. This superior productivity makes India one of the least cost producers of eggs and poultry in the world. Therefore, with a level playing field Indian can compete with any country, not only in the Indian market but even in International market.

3.5.12.0 Disease Control Issues

a) The spread of Veterinary dispensaries and the availability of medicines are grossly insufficient.

b) The cost of veterinary medicine is fairly high with very little production in the public sector to keep a check on the prices fixed by the private drug companies, particularly multi nationals.

c) A separate Veterinary Drug Controller should be appointed since the Drug Controllers are too busy with medicines meant for humans.

d) Poor infrastructure and communication facilities make prompt access to veterinary services difficult.

e) Emphasis should be placed on disease prevention rather than curative treatment. Vaccine development, production and complete protection of the animal population using all available vaccines are absolutely necessary. International
collaborations and linkages should also be developed for diseases that are of concern in other countries also and where expertise or facilities available within the country are inadequate. The ICAR should give the highest priority to developing new vaccines against diseases such as bluetongue and contagious caprine pleuro pneumonia. Once developed, the technology should be transferred immediately to a mix of public veterinary biological institutions and private entrepreneurs, so that the vaccines can become available to Livestock keepers straightaway. In recent times, this development path was followed most successfully by IVRI with the PPR vaccine and the vaccine became available within minimum time after its development. Teams of scientists from public institutions making such important achievements should be given appropriate incentives.

f) The State Governments’ Veterinary biological manufacturing units should be strengthened with adequate funding.

g) There should be quality control agency in place, monitoring the quality of all vaccines produced all over the country.

h) The State Governments should have a separate cadre for the disease diagnostic laboratories and vaccine-manufacturing units. Experts should always head these units.

i) Foot and Mouth Disease, which causes heavy economic losses to the farmers needs priority.

j) Government should provide total disease prevention and control cover area- wise, followed by a public notification so that private industries could set up processing units in such disease controlled areas and meet export requirements as well as benefit farmers of the local areas.

k) In view of the recent WTO regulations, sanitary and phytosanitary provision and risk analysis, it has now become important to achieve harmonization in the vaccine production for live stock and poultry. The Standardization Division at Indian Veterinary Research Institute, Izatnagar should be upgraded as National Veterinary Biological Product Quality Centre. Twelve-selected biological units of the country should develop their infrastructure, meeting GLP (Good Laboratory practice) requirements. All these units should have autonomy.
l) Animal Quarantine Certification Station (AQCS) needs upgradation in the country. The Animal Quarantine, Certification and Enforcement Authority should be created and necessary autonomy/authority to function as an independent body should be empowered with appropriate authority so that the movement of animals with risks of infection/disease could be adequately controlled through important airport, seaport, international land routes and movement within the States. Border posts at land routes on western and eastern international borders and small quarantine stations at seaports like Mumbai, Chennai, Kolkata and Goa can be created. In addition interstate check posts be strengthened and more created, if necessary.

m) Animal disease diagnosis and accreditation as per the international standards, development of an effective surveillance and monitoring system for animal diseases, animal quarantine, certification and enforcement are the function and duty of the Central Government. Keeping in view the importance of animal health control in the post-WTO era, these functions of the Department should get top priority.

n) The prevention and control strategies require promptness in action which can be achieved when the gap between the outbreak and its reporting to planners is reduced. To reduce the gap, there is a need to have a computer based national disease surveillance and monitoring system with intra and inter-district linkages so that proper control of disease could be achieved at a time and forecasting and appropriate measures could be taken to the remaining parts of the district, state and country.

o) Arrangements should be made for immediate transfer of information in the form of reports on WTO agreements, emerging diseases, disease surveillance, etc. so that country could be prepared for any change at short notice.

p) Strengthening of quarantine system with attention to Bio-safety and Bio-security is necessary: All five quarantine stations should be strengthened with diagnostic laboratory facilities for sampling and adequate provision for animal/poultry space, feeding, management, etc. made.

q) Establishment of a National Bio-security Resource Centre to enable government, commodity groups, veterinarians, and producers to meet the challenges of animal health emergencies.
r) Government should put an effective disease reporting and surveillance system and an Emergency Preparedness Plan to counteract outbreak of contagious diseases.

3.5.13.0 Input Issues

a) Most farmers cannot afford stall-feeding in view of high cost of feed supplied by private producers.

b) Area specific mineral mixtures based on locally available and affordable raw materials should be suggested by Agricultural Universities for production in the public/private sector.

c) There is insufficient production and supply chain facility from the public sector to keep the prices in check.

d) Due to shrinkage of common lands due to encroachment etc. and non-management of wasteland, as well as shortage of fast growing fodder tree species, our Livestock is grossly under-fed.

e) There is insufficient extension effort for popularisation and planting of nutritious tree species like Subabul for supply of proteins to the Livestock.

f) There is a shortage of fodder baling machines for efficient management of fodder, especially for transportation.

g) Likely future scenario of demand and supply position in relation to forages is given below. It reveals a huge deficit (prevailing and expected) in green fodder in the country. The available fodder can meet the demand of only 46.7 per cent of total Livestock.

Projected balance between demand for and supply of green and dry fodder presents a challenge for fodder production in the coming years. While the deficits are anticipated to increase as a proportion of the requirements in both the cases, the situation appears grimmer in case of green fodder. Focused strategies and concerted efforts are the need of the hour to face up to this challenge.

Source: Report of the Working Group on Animals Husbandry and Dairying for Tenth Five Year Plan

a) There is a need for Livestock Feed Corporation and fodder security including creation of feed and fodder banks at convenient location. The cultivated fodder production is limited to less than 4.5 per cent of the area under cultivation and it is estimated that dry matter availability is short of the requirement by 30 per cent and concentrate ingredients are also deficit to the tune of over 80 per cent.

b) There is need of extension effort for popularisation of quality enrichment of fodder through treatment with molasses etc.

c) Cost issues also often prevent quality enhancement of feed and fodder.
d) The poor quality and insufficiency of feed has led to insufficient tapping of the resources available in the form of improved varieties of animals.

e) Taxation on veterinary medicines and semen and other veterinary equipments should be abolished in order to benefit the farmers in the Livestock sector.

f) Subsidy in the Livestock sector is meagre. Against Rs. 300 crores of direct subsidies in the Livestock sector, agriculture gets Rs. 16,000 crores as direct subsidy from the Central Government alone.

g) Immediate and long-term loans in the Livestock sector amount to Rs.2,500 crores, which are around 5 per cent of the total credit of the agriculture sector.

h) Cash credit cards and micro credit are virtually unheard of in Livestock production and the scheme of Kisan credit card does not cover Livestock credit. Consequently, more than half of the farm level credit for Livestock production comes from moneylenders, affecting the viability of the Livestock sector for the farmers.

i) Livestock risk is a major issue for farmers considering that the Livestock sector contributes nearly 26 per cent of the agricultural GDP and Livestock distribution is more egalitarian than land. Livestock provides a much-needed diversification of farmers’ income as also a regular cash flow in contrast to seasonal inflow from crops and hence it is critical to ensure affordable, cost effective and efficient Livestock insurance.

j) Notwithstanding the problem of designing and integrated insurance product, in view of the multiplicity of animals in terms of types, breed, age group and quality etc., the work on providing affordable insurance policies, which would be easy to administer and operate and which would result in prompt verification of claims and their settlements, should be taken up with a greater sense of urgency. The Union Cabinet has recently approved a Livestock Insurance Scheme in 100 selected districts. The scheme has been formulated to insure 15 lakh animals with 50 per cent subsidy from the Central Government towards the premium. The scheme should be expanded and implemented actively to benefit farmers.

k) Thousands of tonnes of fodder grasses from common lands go waste every year in the rainy season. Therefore, research and development efforts must be made for better harvesting of fodder resources (especially pasture grasses) when it is
abundant in rainy season. Efforts should also be made for improvement in bailing and storage of this fodder for better utilization during lean season.

1) There is an urgent need to re-evaluate and re-orient the government’s current strategy for the delivery of veterinary services. Greater role for private veterinary service providers and out-sourcing of these services to a certain extent, while optimising the existing service delivery system and manpower for vastly enhanced coverage and sustainable delivery of services, should be the goal in future.

**BOX II**

Some feedback from farmers and other stakeholders on Livestock Service Delivery System (LSD) in Andhra Pradesh

1. Set up community driven Livestock service delivery system for first aid, vaccination, de-worming, AI, etc. outside the government. Also establish community driven LSD in tribal areas, initially paid for by the Government.
2. A large majority of farmers expressed willingness to pay for medicines and services.
3. Animal health & breeding services, even by Govt. staff, should be home delivered. Some also recommended free door delivery of Vet. Services by qualified Vets.
4. Encourage ‘Gopalmitra’ (Para-vet.) system for delivery of AI and minor Vet. Services (MVS). Gopalmitras should be selected from amongst Livestock farmers.
5. Organise regular Vet. Camps in all Mandalas to address breeding problems of bovines.
6. Promote preventive veterinary care on cost sharing between Govt. and farmers.
7. Provide regular subsidized vaccinations and de-worming for small ruminants and back yard poultry through skilled, village based Lady Animal Health Workers (LAHW).
8. Build capacity of shepherds to select, multiply & use improved Rams and Bucks.
9. Provide a package of assistance to encourage stall-feeding of small ruminants.
10. Encourage production and use of fodder, grasses and their seeds by farmers.
11. Provide special packages to improve subsistence livelihoods of tribal communities through training, capacity development, technology transfer and service support.
12. Assign high priority to provision of credit for Livestock production.
13. Promote women self help groups in tribal areas. Impart skill training to farmers to promote self-help and self-reliance.

* Under the project ‘Assessment and Reflections on LSD System in AP’ a collaborative project taken up with the Dept. of AH, GoAP (2003-05).

**3.5.14.0 Marketing**

a) There is a general shortage of appropriate and conveniently located marketing network and itinerant traders often exploit the farmers.
b) Due to poor infrastructure of roads and transport facilities the farmers are not tapping the best markets for prices, even though milk and poultry are exceptions where an efficient marketing network has sprung up in the cooperative and private sectors.

c) Retail marketing outlets in urban areas are still deficient in terms of space and hygienic location.

d) Domestic demands are constrained by religious issues e.g. Muslims do not consume pigs and the Hindus do not consume bovines, particularly cows.

e) Efficient and modern abattoirs, barring exceptions, often do not conform to hygienic and quality control regulations and insufficient attention is paid to the disposal of refuse.

f) Better machinery/containers need to be diversified for transportation of milk, particularly by women to save them from the traditional and tiring methods of carrying milk as head loads. Similarly better transportation vehicles should be designed to enable easier transportation of milk containers.

g) There is no well-organized marketing system for Livestock and meat in India. Since sheep are mostly raised by poor farmers, there is need to organize them into cooperative groups so as to operate organized selling. This should prevent exploitation by traders and help them to get appropriate share of consumer's price.

h) Bullocks would continue to be used in selected areas for haulage where buses/tractors are not available for transportation purposes.

i) In India food consumption basket is also diversified in favour of non-food grain items like milk, meat, egg and fish. The consumption of animal origin food is, however, small as per ICMR norms.

j) Ever increasing demand for Livestock products is the basis for future ‘Livestock Revolution’.

k) There is little meaning in enhancing milk productivity without providing marketing facilities. A good year of milk production would bring cheer to the dairy farmers of Gujarat (which has an effective marketing network under AMUL for milk collection), but not in States like Orissa, Bihar, Kerala and Karnataka because the
excess supply would lead to prices falling or the Milk Unions in these States suffering losses. NDDB could initiate a programme for creating a buffer stock for milk powder during the flush season.

i) The fine wool production in the country is around 4 million kg and the demand from the industry is around 35 to 40 million kg of fine wool, which is mainly imported from countries like Australia. Attempts are also made to utilize the short staple fine wool in cotton system and the trials undertaken are quite successful and they are inviting the attention of the industry.

m) There is a crucial need to effectively implement the relevant provisions of the MMPO to ensure food safety, quality and hygiene. A mechanism has to be evolved for accelerated growth of dairy industry in both public and private sector.

n) Pig rearing has largely remained with the weaker sections of the society, especially scavengers, both as a source of income and a choice of meat for consumption. Cost of inputs and returns were not a serious concern in this system. However, availability of quality pork for a variety of consumers is a scarce item. In the recent years, entrepreneurs have shown interest in pig production, processing and marketing activities as an organized enterprise. Pork products industry has to develop to meet the requirements of the three categories of consumers - traditional consumers, local area consumers (small scale pork processing units) and elite consumers, hotels, restaurants, etc. (Modern processing units on a factory scale). India could consider exporting pork products, as potential markets exist in Southeast Asian countries. Bacon factories have to be brought under private management for improving piggery prospects.

o) The development of live animals’ market information system is vital, as data is a key input to well-informed planning and decision-making. Thus, it is virtually a public good and the Government should actively support this activity. Appropriate scheme should be formulated to strengthen the market facilities and introduce a scientifically managed market for conducting marketing operations as well as collecting proper data on Livestock marketing. No such effort was made in the previous plans and hence need to be given priority.

p) Although the organized sector has shown fast growth in the last three decades, it still accounts for only 30-35 per cent of the total milk marketed in the
country. On the other hand, a far larger proportion of milk continues to be marketed by the unorganized sector – comprising innumerable vendors, small processors, merchants, manufacturers and retailers of indigenous milk products.

q) In the case of milk production, unlike grain production, there is no system of subsidized procurement by the Government. Therefore, any attempt to accelerate the growth rate should be linked with corresponding increase in demand. Measures are needed to increase the purchasing power of the rural and urban poor and also to exploit the market of Indian dairy products for both internal and external consumption.

r) There is a need to transform the national and global market pull into an engine for generating sectoral and national competitive advantage, that is, to create conditions which relentlessly propel – and enable – sectoral decision-makers to creatively utilize the opportunities offered by the new economic environment to establish competitive advantage not only at the firm level but also at industry and sector levels, making India a leading player in global Livestock product markets through sustained and all-round improvements in quality and efficiency.

3.5.15.0 Quality Control Issues

a) Control issues both for domestic consumption and export need substantial improvement.

b) Meat exporters have to adopt Hazardous Analysis Critical Control Point (HACCP) standards. This involves the adoption of quality standards from the stage of production to the stage of export, including processing en-route. This naturally requires substantial awareness generation among producers of the primary product, processors and exporters.

c) Modern abattoirs also have to adopt good manufacturing practices and monitoring of toxic residues, specially pesticides, heavy metals and antibiotics in meat.

d) Quality control of the frozen semen as well as day old chicks of poultry is necessary although this is not yet practiced adequately.
e) Quality control at affordable prices is of utmost importance and there is a need for efficient quality check for the feed being made available to the farmers.

f) Quality control also needs to be strengthened at the processing stage not only for meat but also for animal products like egg powder, cheese pork products etc.

g) Quality standards need to be revisited in consultation with processors and exporters in order to prepare standards, which are implementable, affordable and acceptable, both to domestic and foreign buyers.

h) Looking to the large consumption in the domestic market since 65 per cent of our population is non-vegetarian, difference of standards could be prescribed for domestic and export markets.

i) Revise and redraft the Milk and Milk Products Order for effective implementation of quality standards: carefully review the current apparatus of enforcing these standards in collaboration with the industry and restructure them, if necessary, for greater effectiveness and industry participation.

j) Above all, quality control of Livestock education has to be ensured in order to tap the advances in this sector globally.

### 3.5.16.0 Utilization of Waste

a) Livestock would also be an essential component of the mixed crop Livestock marketing system, particularly for organic farming. Livestock also is necessary for many innovative practices like bio-dynamic fertilisers etc.

b) Pigs continue to be used as natural scavengers and cow dung is the basic feedstock for the gobar gas plant, which would be increasingly needed in the country in view of the dwindling fuel resources in the rural areas.

### 3.5.17.0 Processing Issues

a) In spite of substantial advancements, Livestock offers scope for improvement in processing.

b) Quality of finished leather depends substantially on the efficiency and technology for treatment of the carcass. This, however, is a major constraint since
there is insufficient dissemination of technology and technique in the rural areas for treatment of carcass.

c) Most of the value addition takes place in the industrial sector, while there is a need for encouraging technology for **value addition at the farmer’s level** for enhancing his income.

d) There is a need for greater research for development of technology, processing and machines which could enable farmers to produce semi-processed/processed products for the market for supply to more sophisticated processing industries.

e) Policies are needed for greater integration of production and processing.

f) Policies are also needed for attracting more private sector investment for handling of animal products and setting up of processing units for domestic consumption and exports. This could be in the form of earmarked sub-zones within industrial areas or creation of exclusive Livestock industry processing zones with sufficient infrastructure for common facilities like washing, disposal of waste, cold storage etc.

g) Greater attention needs to be paid for processing milk for more diversified milk products/cheese.

h) Processing of meat from goats and other under-processed animals would be necessary.

i) There is a need to encourage sophisticated processing in speciality meats needed abroad.

j) In view of increasing demand in the urban areas for popular Indian meat dishes, in the wake of rising incomes, processing should increasingly focus on “ready-to-eat” meat and egg preparations featuring the various regional cuisines of India.

k) Wool processing from sheep to produce speciality woollens offers another promising area for processing. Similarly, pig, rabbit and camel skin products, if processed appropriately, can fetch higher earnings for processors and ultimately for the farmers.
1) The Angora rabbit production is popular in hilly areas of H.P., U.P., Eastern region and Tamil Nadu. One Angora rabbit can give net income of Rs. 150 to 200 per year. Such successful experiences should be widely adopted through creation of grass root institutions and public-private linkages.

m) Technological progress in the production, processing & distribution of Livestock products will be central to the positive outcome of the ‘Livestock Revolution’.

n) The poultry processing industry is still in a nascent stage of growth. Presently 97 per cent of the production is sold as live birds. Only 3 per cent is processed and sold as chilled/frozen. One of the obstacles in the way of growth of poultry processing industry is high incidence of duties and taxes – both on the processed products as well as on the equipment for processing e.g. the cumulative impact of Excise Duty Sales Tax, Surcharge on Sales Tax, Octroi and turn over Tax. If the processing industry has to expand, it would be necessary to reduce the burden of duties and taxes substantially, at least until such time as the market’s share of the processed products grows to a level of 25-30 per cent of the total volume of the production.

o) Although the organized sector has shown fast growth in the last three decades, it handles only about 30-35 per cent of the milk marketed and about 65-70 per cent of the market share is still in the hands of unorganized sector. This sector is characterized by innumerable vendors, small processors, merchants, manufacturers and retailers of indigenous milk products. So far, the Government efforts for dairy development are restricted to cooperative sector only. Time has come to bring about structural changes in the unorganised sector. In order to achieve this, the following programmes should be undertaken:

p) Processing at the village level: Since the production is primarily through small producers, it makes collection of milk twice daily cumbersome and uneconomical in remote areas. Primary processing and manufacture of milk products can be taken up at village level. This would, however, require development and standardization of technology.

q) Quality upgradation in small sector manufacture: The small manufacturer of indigenous products viz. Halwai should be assisted to upgrade his processing and
improve quality of the products through use of hygienic practices and improved equipment.

3.5.18.0 Contract Farming

a) Individual Livestock farmers are often exploited by middlemen in view of lack of bargaining and absence of economies of scales.

b) There is a good possibility for encouraging contract farming in the Livestock sector where individual farmers contract with large producers/processors for regular supply and pre-determined prices. Large processors can provide good quality frozen semen/feed/disease control and other veterinary services to farmers to ensure a win-win situation.

c) NDDB pattern has shown efficacy of this system for milk and this can be extended to the entire Livestock sector provided adequate incentives are given to the industry to encourage them to invest in this profitable but risky field.

d) Small farms, which were set up under various self-employment schemes were not so successful – mainly due to lack of technical and marketing support. This obstacle can be removed, if we encourage the concept of poultry estates – comprising of a central unit, or a “mother unit”, and a number of producers attached to it. The mother unit rears the birds up to point of lay; takes care of all the critical aspects like brooding, vaccination etc. It supplies feed and other inputs to the producers and also takes care of marketing and repayment of loans out of the sale proceeds. The producers will be required to handle only the simple operation of feeding and watering the birds and collection of eggs etc. Such poultry estates can be successfully operated by rural women – and can play a very important role in economic empowerment of women.
BOX III

Contract Farming

The Nestle India Limited – one of the largest and oldest firms in dairy business in India sources nearly 250 million kg milk annually through contract farming from over 85000 producers spread over more than 1500 villages in Punjab. With an assured market at their doorsteps the producers could save transaction costs to the extent of 90 per cent and reaped double the profits than the non-contract producers selling directly in the market. The price received by the contract producers was no less than the market price. Besides, they also received feed, medicines, fodder seed etc., and veterinary and agronomic services. Nearly 60 per cent of the producers had 5 or less dairy animals.

The case of contract farming in broiler production relates to Venkateshawara Hatcheries Limited in Andhra Pradesh. The firm shares nearly 80 per cent of the cost of production (chicks, feed and medicine) and provides veterinary services to the contract producers with buyback of entire production. The producers receive fixed remuneration on per bird basis for their contribution to production costs. The transaction costs to the producers are not much as the entire costs related to supply of chicks, feed and medicines is borne by the firm. The major benefits for the contract producers were assured returns, and transfer of production and market risks to the firm. On an average, contract producers received 13 per cent higher profits compared to non-contract producers. About one-third of the producers were small (<5000 birds).

Source: P.S. Birthal et.al, NCAP, New Delhi, 2005

3.5.19.0 Commercialisation

a) Slowly but surely, the farmers would have to move from mere subsistence rearing to more profitable but more risky and more costly production systems. This can be done when feed and management system help to augment the productivity in terms of quicker weight gain, better food efficiency, increased yields and reduced incidence of disease and mortality.

b) NGOs and research institutions / universities / State departments need to substantially enhance their efforts to provide training to young and educated farmers. They could be provided technology, financial incentives and handholdings through the initial years to act as role models.

c) Employment in Animal Husbandry sector was 9.8 million in major States (out of which 7.90 million were in rural areas) and 8.6 million in subsidiary States. Women constitute 71 per cent of the labour force in Livestock farming. In dairying, 75 million women are engaged as against 15 million men.
d) Diversification of a crop based rural economy into a crop-livestock mixed farming system must be encouraged for rapid economic development and generating equitable income and employment in the country.

e) It is estimated that more than 25,000 people in different parts of the country are directly dependent for their livelihood on layer farming. Similarly broiler farming provides direct sustenance to more than 1 lakh farmers. In addition, more than one million people are directly or indirectly dependent on poultry farming. Thus, it is estimated that the poultry sector is providing direct and indirect employment to about 1.6 million people in the country. It is also important to note that unlike other industries, the Poultry sector provides employment opportunities even to unskilled labourers and women. Employment generation in the Poultry sector can, therefore, be comparatively easily achieved through enhancement of demand for eggs and poultry meat. Considering the protein deficiencies in our country, lower cost of poultry compared to mutton and the health benefits of ‘white’ meat, this should not be difficult, in spite of the temporary scare created by Avian Flu.

f) As per the opinion of the World Bank experts, with an initial investment of Rs. 200 crores in Operation flood II, the net return/year to the rural economy has been Rs. 24,000 crores. No other major development programme all over the world has matched this input-output ratio.

### 3.5.20.0 Exports

a) India still accounts for miniscule part in the world trade in livestock products and there is a great scope for prosperity both for the farmers as well as for the processors and exporters if due attention is given to efficient monitoring and stringent quality control.

b) WTO has led to opportunities as well as threats in the Livestock sector. India with its large Livestock population and farmers need to increase the domestic demand as well as opportunities by streamlining the supply chain and attention to HACCP standards as well as Codex Alimentarius standards.

c) There is a great need for strengthening of the cold chain through encouragement to the construction of the cold storages and refrigerated vans for transportation of meat instead of live animals.
d) Dairy products accounted for the largest expenditure on export subsidies in the post-WTO period. In 1998, the US provided export subsidies on dairy and poultry meat with dairy reaching 90 per cent of the US volume limit. The level of subsidies offered by the US and the EU for SMP and Butter respectively account for 55-65 per cent of the domestic price of these commodities in India.

e) Indian tariffs for dairy products are low as compared to major countries. For SMP, the bound tariffs are 237 per cent in Canada and 176 per cent in Korea - as against the renegotiated 15 per cent on the first 10,000 MT and 60 per cent thereafter for India. For Butter the bound tariff works out to a phenomenal 648 per cent in Japan, 351 per cent in Canada, 113 per cent in the EU and 100 per cent in the US - as against 40 per cent in India. These computations are based on current international prices, exchange rates and other relevant assumptions. The tariff on butter/butter oil and cheese needs to be increased from 40 per cent to at least 75 per cent.

f) The infrastructure in handling of Livestock products also needs to be modernized at the ports in view of the highly perishable nature of the commodity. Such credit arrangements need to be worked out by the EXIM Bank in consultation with exporters to cater to the realities with international trade in this sector.

g) The extensive use of export subsidies (mainly, the EU and the US) in world trade in dairy, meat and poultry products depresses the world market prices and makes the products from all non-subsidizing exporting countries such as India uncompetitive. The size of export subsidies and the high proportion of world trade to which exports subsidies are applied both suggest that there is a need to strongly negotiate complete elimination of export subsidies in the upcoming WTO rounds.

h) Ministry of Commerce should collect the data on global trade, production and demand, global prices and subsidies provided and analyze them to project the future global market situation in respect of Livestock products.

i) There are many competitive advantages for India in dairy products trade such as higher quantum of production and lesser cost of production than any other countries. India enjoys competitive advantage over New Zealand, Australia and USA (Average cost of production-US dollars 0.32 per litre) of being able to produce milk at a lower cost (US dollars, 0.16 per litre).
j) India’s international trade in Livestock and Livestock products is mainly in live animals (17 per cent), meat and meat products (82 per cent), dairy products and eggs (1 per cent). At the global level, India’s exports and imports account for only 0.17 per cent of each. Meat and meat products have dominated the exports from Livestock.

(k) Domestic Market Intelligence should be collected and disseminated by the Department of Animal Husbandry, Dairying and Fisheries (DAHDF) on production, demand, import and export, future projections domestic prices and projections and concerns on Bio-diversity.

(l) The DAHDF should also coordinate with the Ministry of Commerce, DGCIS and other relevant organizations on important issues arising out of the International regulatory system (WTO/SPS) with reference to Livestock products like WTO provisions, analysis of Indian trade intelligence, non-tariff export barriers, global market intelligence, Indian trade intelligence, Import management, Export management, SPS notifications, SPS gaps and concerns, etc.

Government departments and other organizations are discharging most of the above-mentioned functions currently, but there is a lack of coordination and unified policy direction. An Advisory Committee on International Regulatory Matters (WTO/SPS) pertaining to Livestock Products could be set up to take an integrated, prompt and pro-active view.

3.5.21.0 Pastoral Community

a) Pastoralists are people who predominantly depend upon Livestock for livelihood and graze their animals on common property resources. They are often nomadic. These communities use indigenous knowledge in animal breeding; adopt seasonal and spatial grazing systems which are holistic, complementary to forest ecology and symbiotic with agro-eco system. They benefit farmers by supplying organic manure, plough bullocks or means of local transport of agriculture produce. Pastoral livestock is linked to the conservation of wild animal species. Survival of pastoralism is crucial for sustainable land use, conserving domestic biodiversity and providing means of producing food in dry lands without depleting ground water
resources. Livestock breed are linked to cultural diversity and there is a link between ethnic / social groups and specific breeds. For Livestock only in situ conservation achieves all conservation goals with ex situ conservation only as a back up. Unfortunately, in India, a major factor for reduction in animals of indigenous breeds is the closure of forest for declaration as a Sanctuary / National Park and harassment from Forest Department staff.

b) The livelihoods of pastoralists and smallholder farmers are threatened by the progressive loss of grazing land for their animals, limitations to mobility, inadequate or inappropriate government policies, and lack of animal health and other services. These developments are also causing the progressive loss of the Livestock breeds and species that provide rural livelihoods and life-style options. The problems of the pastoral community can be listed as under:

i. Grazing permits are denied in traditional grazing sites.

ii. Original pasture land/drinking water ponds are encroached or converted for other purposes.

iii. Common property resources or grazing lands are sometimes allotted to corporations, thereby leading to a shortage of vital grazing areas for sustainable Livestock production.

iv. Pastoralists are excluded from forestry programme like Joint Forest Management and Biodiversity Conservation.

v. Forests are closed completely for tree planting and rotational grazing system is not adhered to for providing alternative grazing sites in a participatory mode.

vi. Pastoralists are conservers of domestic animals biodiversity, contributing to ecology and economy. They should be integrated in forestry programme in a holistic manner, utilizing their traditional knowledge.

vii. The proposed Scheduled Tribes (Recognition of Forest Rights) Bill should provide restoration of traditional grazing / camping rights in forest areas to formalize their entitlements through issue of permanent grazing cards. A tree planting programme must be accompanied with alternative grazing land/drinking water provisions.
viii. In-depth documentation and characterization of indigenous Livestock breed should be carried out to recognize and protect the rights of local community.

ix. Common land assigned to Forest department and unutilised or encroached land should be retrieved and brought under the control of Gram Sabhas for pasture land development.

x. Camel milk should be included in Dairy Acts of States like Rajasthan in order to encourage demand and ensure a remunerative price for the pastoralists and farmers maintaining camels.

xi. An effective system of transfer of know-how directly to the camel-breeders should be put in place through extension of the activities of the National Research Centre on Camels.

xii. There should be a total ban on slaughter of fertile and healthy female camel.

xiii. Rajasthan’s camel population has shown a steep decline of 24 per cent since 1997 and many promising indigenous breeds are getting lost. There should be a National Policy on Camels in view of their socio-economic value and their contribution to the bio-diversity, particularly for the pastoralists and others in States like Rajasthan.

xiv. Mechanisms should be put in place to protect pastoralists from unscrupulous elements/officials when they migrate with their camel and sheep across States.

xv. Sheep, goat and camel should be included in the Famine Code.

3.5.22.0 Miscellaneous

a) Land should be provided to every below-poverty line family but holding some land, for purchasing a basic unit of cows/buffalo/poultry etc.

b) The conjunctive use of Livestock, therefore, should be studied at greater detail to ensure that they are not only treated as raw-material for industries consuming milk for their requirement of milk and meat but are also developed for meeting these requirements of rural areas.
c) The productivity of our milk cattle is very low (1.5 lit animal/day). Artificial insemination facilities have not reached the doorstep of farmers. Animal health coverage should be given greater priority in State budgets.

d) The AH extension has been not given its due in previous Plans. There is great scope of AH extension to contribute towards poverty alleviation and self-employment scheme being implemented in the country.

e) Technology supported and demand driven Livestock revolution will be the future engine for growth that could ensure nutritional security, livelihood of rural poor and women empowerment.

f) Sustainable and financially viable Livestock and poultry farming, which will generate wealth and self-employment through entrepreneurship, is the need of the day.

g) External markets are an extremely important source of demand and these should be tapped much more aggressively.

h) Public sector lending in Livestock sector is very low leading to poor capital formation.

i) There is a need for consolidation and convergence of all animal husbandry related activities and schemes operated by different ministries.

j) Animal husbandry services need to be delivered at farmers’ door and linked with cost recovery for economic viability.

k) DAHDF should play the role of a regulatory authority, particularly for quality control, more actively.

l) Commission on Agricultural Costs and Prices (CACP) could be asked to undertake estimation of cost of production of various Livestock products also and suggest reasonable prices.

m) Livestock extension is primarily based on providing services and goods; it needs to be treated differently from crop related extension activities.

n) An integrated approach is necessary for regeneration of the grazing lands.
o) To promote animal care and well being, veterinary institutions like universities, colleges, hospitals, dispensaries and NGOs working on Livestock care system need to be strengthened.

p) The delivery and input cost of all the services need to be recovered, from the resource rich farmers on commercial basis in order to be sustainable.

q) NDDB should focus on the dairy development activities all over the country, both in organized and unorganized dairy sectors.

r) In the short run, in zones with high incidence of poverty and low resource endowments, emphasis should be on research strategies that are less capital intensive, have higher probability of success that are well accepted by the clientele and yield a good rate of return. Animal nutrition and health fall in this category.

s) In the long run, genetic research would be a key factor in growth and development of the Livestock sector. Development should focus on upgrading the native breeds of cattle and buffalo since the poor keep them for various functions.

t) The Policy needs to focus on improving the basic conditions through improved management of land and water resources in the drought prone regions. This would imply a shift from techno-managerial approach towards dairy development to a more holistic approach, which simultaneously helps regeneration of land and water resources and at the same time improves the share of the poor in the Livestock sector, especially in the drought prone regions where it is needed the most. At present, the dairy sector has moved into the areas where the basic conditions with respect to land, water and other agronomic features are relatively more favourable. The next stage, however, will have to be significantly different where regeneration of land and water should become an integral part of the dairy development.

u) The dairy development programmes, therefore, need to take the imitative for pasture development and thereby strengthen the backward linkages covering a larger number of households and area.

v) In this respect the dairy development agencies might be in a better position to shoulder the responsibility of developing pastureland. It could offer direct incentives in terms of increased returns from such activities. The watershed programmes devoid of these linkages might find it difficult to involve people in
development of CPRs. The need, therefore, is to co-ordinate the activities whereby the dairy development agencies may take the major lead towards regeneration of the community pastures and water resources. This is essential if the benefits are to reach the poor in drought prone regions.

w) Regulated grazing requires community effort. The present laws and people do not feel concerned about the conditions of CPR’s. Therefore, transfer of ownership or some mechanisms to make people feel concerned about village resources can be a point for action. Though presently they have grazing rights in forest and grazing lands but they are using these in negative ways leading to collapse of traditional systems of management.

x) It has to be recognized that in the general field of agriculture 70 per cent of the farmers are small and marginal farmers, and they have access to a total of 30 per cent of the land in this country. Of these, 67 per cent own Livestock and the general pattern is that these Livestock units are very small and financially non-viable. These people are also poorest of the poor. Bulk of them live below the poverty line without any access to normal channels of credit and are unable to take advantage of government’s benevolence through its various schemes. Despite the efforts of the government during last five decades, these poor are in continuous penury, as they did not get a chance for making some marginal improvement in their lives. They remain poor because they have no access to the presently available technologies nor to the credit regimes; consequently they cannot increase their assets. What they market is perishable and, therefore, the middlemen and traders exploit them by offering low prices, which are invariably below the cost of production. Traders fix farm gate prices and these are quite often below the production cost.

y) There is urgent need for Livestock owners to be provided with relevant literature in Hindi and local language regarding the common diseases of Livestock, their diagnosis and control procedures.

3.5.23.0 Specific Issues for North-Eastern States

a) Quality pigs are not available for breed improvement and pork has to be imported from other States. This problem can be tackled through establishment of nucleus pig breeding farms in each State with exotic Hampshire pigs and indigenous
strains. Similarly, one nucleus farm in each district headquarter should be established for produce of pig with 75 per cent exotic inheritance. Further, a breeding unit should be established at the block level with capacity to produce improved pigs for distribution to farmers at village level at the rate of 5-6 pig per farm family. Briefly, a graded pig programme should be taken up for breed improvement over time.

b) Due to logistic problems government machinery is unable to provide effective and timely delivery of services like feed, vaccination, artificial insemination etc. while NGOs / SHGs/ Cooperatives should be increasingly involved in this task. Research findings on use of locally available feed for location specific pig rations need to be disseminated. Sweet potato based pig feed should be encouraged because of its local availability. Similarly processing units should be established for utilizing groundnuts cake for pig feed. SHGs/Cooperatives/unemployed youth need to be trained in delivering artificial insemination services to pig growers.

c) A Regional Research Laboratory for animal diseases diagnosis using conventional and molecular techniques needs to be established. SHGs/Cooperatives should be trained for vaccination to supplement the efforts of the Government.

d) In view of popularity of the pork and its value added produce in the region, one modern abattoir should be set up in each capital city with processing facilities. Existing butchers with traditional skills should be employed in these abattoirs, after skill upgradation through training. Facilities for processing of non-edible offals from these abattoirs should be provided to optimise utilization of resources.

e) Poultry also presents great scope for exploitation and income generation. A Nucleus Breeding unit with grandparent lines needs to be established in each State. Backyard poultry should be encouraged through promotion of varieties like Vanaraja, Giriraja, Gramapriya etc with collaboration of various stakeholders.

f) In respect of Piggeries, existing integrated progeny development scheme should be carefully assessed to identify regions for poor utilization in spite of the vast potential for progeny in the North East. Apparently, farmers are unwilling to relocate to areas with poor availability of water and electricity, mainly to Farmers’ piggery villages. Further, piggery villages would not succeed without active base farms. Lastly, the programme has concentrated on passage of subsidy without adopting a holistic approach involving backward and forward linkages, specially marketing.
The programme is also constrained with low level of entrepreneurship due to the limited risk taking capacity of the farmers, inadequacy of parent stock, poor infrastructure at farm level for rearing pigs, poor outreach of veterinary services, low value addition and processing facilities etc. The scheme should be restructured, with focus on the poorer section of the society who is deficient in financial resources, scientific knowledge and efficient rearing practices. Instead of piggery villages, it may be desirable to adopt cluster approach at village level for pig production, covering all aspects of supply, fattening and marketing. It would be desirable to develop successful models of crop-dependent piggery development and in their popularisation through demonstration by KVKs. Participatory research and development on piggery practices and management with focus on the felt technological needs of the pig farmers should be ensured. Differential implementation strategy should be planned for upland and higher uplands. A simple preventive disease control programme should be implemented through village youth, especially for control of diarrhoea, in weaning pigs and parasitic diseases.

CHAPTER 3.6

GUIDING PRINCIPLES UNDERLYING THE DRAFT NATIONAL POLICY FOR FARMERS

AGROFORESTRY: INTEGRATING THE NEEDS OF TODAY AND TOMORROW

3.6.1.0 Definition and Concept of Agroforestry

3.6.1.1 “Agroforestry is a sustainable management system for land that increases overall production, combines agricultural crops, tree crops and forest plants and/or animals simultaneously or sequentially and applies management practices that are compatible with the cultural patterns of local population” (Bane et al., 1977).

3.6.1.2 Agroforestry, the word coined about three decades ago, is now seen as a science-based pathway to achieve natural resource management and poverty alleviation addressing several of the Millennium Development Goals. It has emerged as an efficient multi-functional land use and management system that optimises land productivity on a sustainable basis by involving positive interactions between its components in time and space where woody perennial, trees or shrubs, are grown with arable crops. In operational terms, it satisfies three basic conditions: (1) there exist at least two plant species that interact biologically, (2) at least one of the plant species is a woody perennial and (3) at least one of the plant species is managed for forage, annual or perennial crop production.

3.6.1.3 The escalating worldwide interest in tree planting activities during the past three decades (1970 onwards) resulted in the emergence and popularization of several terms ending with word ‘forestry’ viz., Community forestry, Farm forestry, and Social forestry. In all these one thing is common i.e., people’s participation in tree planting activities – not necessarily with agricultural crops or animals as is in Agroforestry. The social forestry is considered to be the practice of using trees or tree
planting specifically to pursue social objectives, to help the poor people to improve their living conditions and meeting their routine requirements of fuelwood and fodder. The purpose of all these forestries is growing trees and using them to provide fuel, medicine, minor timber and fodder. The major distinction between Agroforestry and the above other terms is that Agroforestry emphasizes the interactive association between woody perennials and agricultural crops and animals for multiple products and services, whereas the other terms simply refer to planting the woodlots.

3.6.1.4 The Agroforestry System is capable of yielding timber, fuelwood, biofuels, food, fodder, feed, and medicinal and industrial non-timber products, and conserve and rehabilitate ecosystems. However, in recent times it is often equated with the timber production on the farm, particularly in northern India. It is estimated that about half of the country’s timber requirement is produced through the Agroforestry systems. There is a need to recognize that Agroforestry in India has numerous forms and combinations – ranging from timber based systems in the north to Kerala home gardens, Khejari systems in semi arid/ arid regions of Rajasthan, and so on.

3.6.2.0 Need and Scope of Agroforestry

3.6.2.1 Relationship of man with trees and the land use systems is as ancient as the very evolution of human civilization and use and domestication of plants. Tree-based farming systems integrating trees into agriculturally productive landscape - a practice known as Agroforestry, is an age old practice. In India, Agroforestry has been a way of life for over 5000 years. Shifting cultivation in India is prehistoric and partly a response to agro-ecological conditions in the region. Horticulture as co-existent with agriculture is found to have been prevalent in India from early historic period (500 B.C. to 1st century A.D.). References occur in different texts of the Vedic literature. The cultivation of date palm, banana, pomegranate, coconut, jujube, aonla, bael, lemon and many varieties of other fruits and requirement of livestock in agriculture and mixed economy of agriculture and cattle breeding may be traced in proto-history chalcolithic periods of civilization. The role of many common trees such as Khefri or sami (Prosopis cineraria), aswattha (Ficus religiosa), palasa
(Butea monosperma) and varana (Crataeva roxburghii) in Indian folk life has been mentioned in ancient literature of Rig Veda, Atharva Veda, and other Indian scriptures. Traditional Agroforestry systems manifest the rural people's knowledge and methods to benefit from complementary uses of annuals and woody perennials on a sustained basis. It also indicates that the farmers have a closer association with trees than any other social group and promoters of forests.

3.6.2.2 The farmers and land owners in different parts of the country integrate a variety of woody perennials in their crop and livestock production systems depending upon the agro-climatic conditions and local needs. Most of these practices are however, very location specific and information on these are mostly anecdotal. Therefore, their benefits have remained vastly under-exploited and unextrapolated to other potential sites. It has now been well recognized that Agroforestry can address some of the major land-use problems of rainfed and irrigated farming systems in India and that a great deal can be accomplished by improving the indigenous systems. With the current interest in Agroforestry worldwide, attempts are being made in India to advance the Agroforestry techniques using indigenous and exotic multipurpose and nitrogen-fixing woody perennials.

3.6.2.3 One of the important criteria that should guide the Agroforestry efforts in India is the “high-value low volume system concept.” The other criteria should be that the post harvest, value addition, packaging and marketing are made as an integral part of the system as a whole; a broadened approach from just production, as has been in the past. Another important consideration is the recognition of the fact that Agroforestry systems also provide environmental services (which are often overlooked) in addition to the economic gains and other contributions. It is worth mentioning here that Agroforestry systems are probably the only means for getting the desired tree cover in the country, especially in States that have low forest area.

3.6.2.4 Currently, of the nearly 300 million ha arable land in the country, including about 68 million ha under forests, a little over 25 million ha are under tree plantations (Table 1). Of this, 1.24 million ha are under farm forestry/Agroforestry. However, as
projected by the Planning Commission (2001) under the Greening India programme, additional 28 million ha can be brought under Agroforestry in a 10-year period, increasing the total Agroforestry area to over 50 million ha.

Agroforestry for Food, Fuel and Fodder Needs

3.6.2.5 It is important to note that there will be a further significant decline in crop land per head by the middle of this century due to population increase. There being no scope for increasing the area under cultivation, additional food production must accrue through increased productivity or from land not conventionally considered arable. A management system, therefore, needs to be devised that is capable of producing food from marginal agricultural land and is also capable of maintaining and improving the quality of producing environment.

3.6.2.6 Fuel wood is one of the established sources to meet energy requirement. At present we are utilizing 60-80 million tonnes of dry cowdung, equivalent to 300-400 million tonnes of freshly collected manure. The Agroforestry has both productive and
protective potential, and it can play an important role in enhancing the productivity of our lands to help meet the demand of ever-growing human and livestock population.

3.6.2.7  **Food**

1. Enhanced sustainability of cropping systems through soil and water conservation by arrangements of trees to control run-off and erosion.
2. Enhanced food and feed production from crops associated with trees through nitrogen fixation, better access to soil nutrients brought to the surface from deep tree roots, improved availability of nutrients due to high cation exchange capacity of the soil and its organic matter and mycorrhizal associations.
3. Food for man from trees in the form of fruits, nuts, cereal substitutes etc.
4. Feed for livestock from trees.
5. Micro-climate improvement due to trees, particularly shelter-belts and wind-breaks in arid and coastal areas.

3.6.2.8  **Water**

1. Improvement of soil-moisture retention in rainfed croplands and pastures through improved soil structure and micro-climate effect of trees.
2. Regulation of stream flow, reducing flood hazards and a more even supply of water through reduction of run-off and improvement of interception and storage in infiltration galleries.
3. Improvement in drainage from waterlogged or saline soils by trees with high water requirements.
4. Bioremediation of water by sequestration of heavy metals and other toxic wastes by trees.

3.6.2.9  **Energy**

1. Fuel-wood for direct combustion.
2. Pulp wood for paper industry.
3. Pyrolytic conversion products such as charcoal, oil and gas.
4. Ethanol produced from fermentation of high-carbohydrate fruits.
5. Oils, latex and other combustible saps and resins.
6. Waste wood for wood based power plants to generate electricity in a decentralized manner.

3.6.2.10 Shelter

1. Building materials for shelter construction.
2. Shade trees for people, livestock and shade-loving crops.
3. Wind-breaks and shelter-belts for protection of settlements, crop lands, pastures and roadways.

3.6.2.11 Raw Material for Industries

1. Raw material for pulp and paper industry.
2. Tannins, essential oils and medicinal ingredients.
3. Wood for agricultural implements and various crafts.
4. Fibre for weaving.

3.6.2.12 Cash

1. Direct cash benefits from sale of tree products.
2. Indirect cash benefits from increased productivity.

3.6.3.0 Types of Agroforestry Systems and Steps for Developing Agroforestry Technology

3.6.3.1 Agroforestry systems have been classified on the basis of structure, function and socio-economic aspects. The structure of the Agroforestry system can be defined in terms of its components and the expected role or function of each. In this system the type of components and their arrangement are important.

Nature of Components

3.6.3.2 On the basis of nature of components following common Agroforestry systems / practices are prevailing in different agro-ecological regions of India:
1. Agri-silviculture (trees + crops)
2. Boundary plantation (trees on boundary + crops)
3. Block plantation (block of trees + block of crops)
4. Energy plantation (trees + crops during initial years)
5. Alley cropping (hedges + crops)
6. Agri-horticulture (fruit trees + crops)
7. Agri-silvi-horticulture (trees + fruit trees + crops)
8. Agri-silvipasture (trees + crops + pasture or animals)
9. Silvi-olericulture (trees + vegetables)
10. Horti-pasture (fruit trees + pasture or animals)
11. Horti-olericulture (fruit trees + vegetables)
12. Silvi-pasture (trees + pasture/animals)
13. Forage forestry (forage trees + pasture)
14. Shelter-belts (trees + crops)
15. Wind-breaks (trees + crops)
16. Live fence (shrubs and under-trees on boundary)
17. Silvi or Horti-sericulture (trees or fruit trees + sericulture)
18. Horti-apiculture (fruit trees + honeybee)
19. Aqua-forestry (trees + fishes)
20. Homestead (multiple combination of trees, fruit trees, vegetable etc).

Besides these common Agroforestry systems, there are many more component combinations followed in different agroecological regions of India.

**Arrangement of Components**

3.6.3.3 The arrangement of components gives first priority to the plants. Even in Agroforestry system involving animals, their management according to a definite plan, e.g. a rotational grazing scheme, gives precedence to the plants over animals. Such plants arrangements in multi-species combinations involves the dimension of space and time.
Functional Classification of Agroforestry Systems

3.6.3.4 Two fundamental attributes of all Agroforestry systems are productivity and sustainability.

1. **Productive Functions:** The various productive functions (producing one or more products) of Agroforestry systems are food, fodder, fuel-wood and other woods, besides other products.

2. **Protective Functions:** The protective functions (protecting and maintaining production systems) of Agroforestry systems are wind-break, shelter-belt, soil conservation, moisture conservation, soil improvement and shade (for crops, animals and man) and nutrient cycling.

Socioeconomic Classification of Agroforestry Systems

3.6.3.5 Based on such socio-economic criteria as scale of production and level of technology input and management, Agroforestry systems are grouped into three categories.

1. **Commercial System:** The term commercial is used whenever the scale of the production of the output (usually a single commodity) is the major aim of the system: the scale of operations is often moderate to large and ownership may be government, corporate or private; labour is normally paid or otherwise contracted. Examples include commercial production of agricultural plantation crops, other crops or pasture animals; with permanent under planting of food crops, or pasture/animals; commercial production of shade-tolerating plantation crops such as coffee, tea and cocoa under overstorey shade trees; rotational timber or food crops system in which a short phase of food-crop production is used as a silvi-cultural method to ensure establishment of timber species (various forms of *taungya*); commercial grazing and ranching under large-scale timber and pulp plantations etc.

2. **Intermediate Agroforestry System:** Intermediate Agroforestry systems are those between commercial and subsistence scales of production and management, production of perennial cash crops undertaken on medium to small scale, wherein
the cash crops cater for cash needs, and the landowner or those with long-term tenancy rights to land, reside and work themselves on the land, supplemented by paid temporary labour. Various Agroforestry systems in many parts of the world can be considered intermediate systems, especially those based on plantation crops such as coffee, cocoa, numerous fruit trees and short-rotation timber species.

3. **Subsistence Agroforestry System:** Subsistence Agroforestry systems are those wherein the use of land is directed towards satisfying the basic needs, and are managed mostly by the owner or occupant and his family. Cash crops including sale of surplus production of commodities, and all forms of traditional shifting cultivation are the most widespread examples.

3.6.3.6 The words ‘systems’ and ‘practices’ are often used synonymously in Agroforestry literature. However, an Agroforestry system is a specific local example of a practice, characterized by environment, plant species and their arrangement, and socioeconomic functioning. An Agroforestry practice denotes a distinctive arrangement of components in space and time. The most common Agroforestry practices that constitute the diverse Agroforestry systems throughout the tropics along with their main characteristics are listed in **Annexure I**. The essential characteristics of the different regions in India and the major Agroforestry emphasis in each are summarized in **Annexure II**. The major types of Agroforestry systems found in different agro-ecological zones along with the nature of their main benefits and role have been summarized in **Annexure III**.

**Suitable areas for Agroforestry**

3.6.3.7 The following type of land can be assigned for Agroforestry:

- Cultivable land
- Field boundaries
- Along with farm roads and *nallah* sides affected by erosion.
- Pockets within cultivated holding where cultivation is not possible
- Old fallows
• Cultivable waste
• Other areas like community or panchayat land etc. in which Agroforestry can be incorporated.

Suitable Tree Species for Agroforestry

3.6.3.8 The following considerations should be kept in view while selecting the species.
• Suitability for growing under the prevalent agro-climatic conditions.
• Utility of trees for meeting the needs of farmers for timber, fodder, fuel, fruit and fibre etc.
• Preference may be given to indigenous and fast-growing species, and leguminous and other nitrogen-fixing species. Species that provide raw material for cottage industries should be encouraged.

Type of Tree Species

3.6.3.9 Though the primary concern is to keep up the production level of the arable crops, the following criteria are worth considering for planting trees under the Agroforestry system:
• Non interference with arable crops;
• Easy establishment;
• Fast growth and short gestation period;
• Non-allelopathic effects on arable crops;
• Ability to fix atmospheric nitrogen;
• Easy decomposition of litter;
• Ability to withstand lopping;
• Multiple use and high return; and
• Ability to generate employment.

3.6.3.10 It is extremely difficult to select species having the ability to fulfill all these criteria. Therefore the researcher and extension workers can allot some points for each criterion, in consultation with the farmers who are directly taking part in
adopting Agroforestry on their fields and select the species that score the most points. It is truly a participatory and decentralised decision-making process.

3.6.3.11 **Tree Species based on Specific Utilization Purpose**

1. **Fodder-cum-fuelwood Species**: Albizia amara, Albizia procera, Albizia lebbeck, Erythrina indica, Gliricidia sepium, Hardwickia binata, Leucaena leucocephala, Pithecellobium dulce, Prosopis cineraria, Sesbania grandiflora, Sesbania sesban.

2. **Fuel-wood and Timber Species**: Acacia nilotica var. cupressiformis, Acacia nilotica, Albizia lebbeck, Albizia procera, Azadirachta indica, Cassia siamea, Casuarina equisetifolia, Dalbergia sissoo, Dendrocalamus strictus, Pongamia pinnata, Melia azaderach, Parkinsonia aculeate, Thespesia populnea.

3. **Softwood and Pulpwood Species**: Ailanthus excelsa, Ailanthus tryphysa, Bombax ceiba, Paraserianthes falcatoria, Populus deltoids, Bamboo species

4. **Fruit and Vegetable Species**: Annona reticulata, Annona squamosa, Artocarpus heterophyllus, Emblica officinalis, Moringa oleifera, Zizyphus mauritiana.

**Priority for Selection of Species**

3.6.3.12 After the screening of the species to suit the agro-climatic conditions, the next aspect is profitability. Ideally, the production of agricultural crops should not be affected. But in reality, farmers want to earn higher total returns. Uncertainties about the marketing of wood can be greatly reduced by establishing a suitable marketing network to handle the Agroforestry produce. Varying agroclimatic regions (15) require different types of trees to suit them. The species priority of MPTS based on research experience has been worked out. Names of five MPTS based on priority for each region are presented in **Annexure IV**. One may find that the species of *Eucalyptus* sp., *Acacia nilotica*, *Casuarina equisetifolia*, *Dalbergia sissoo*, *Gmelina arborea*, *Populus deltoides*, *Leucaena leucocephala* are prominently common in
many regions. Emphasis on research on these species in these regions is required. However, considering the country’s needs of industry and domestic sectors six species were considered by the Task-Force on Agroforestry for according top priority in research and development of Agroforestry in the country. These species are *Acacia nilotica*, Bamboo, *Casuarina equisetifolia*, *Populus deltoides*, *Eucalyptus* sp. and *Prosopis ceneraria*. Thus, system and species priorities are indicated to emphasize the future direction of research on Agroforestry in the country. The choice of MPTs for different rainfall patterns and rotation cycles are presented in Annexures V and VI, respectively. The priority ratings for different Agroforestry systems are also given to focus on those modes for optimizing the resources (Annexure VII), and described later in Section 3.6.5.0.

**Steps for Developing Agroforestry Technology**

3.6.3.13 The following questions (check list) should be kept in mind for establishing appropriate Agroforestry system:

1) For what sites is it appropriate?
   i. What kinds of soil, rainfall, slope?
   ii. For what size and type of farm, in what landscape niche?

2) For what functions is it intended?
   i. What can farmers use it for?
   ii. What are the trade-offs between functions?

3) Which species or varieties are recommended?
   i. Which multipurpose trees and shrubs? Which varieties?
   ii. Which associated crops or livestock species can be used?

4) Which arrangements are recommended?
   i. How many of each component, in what configuration and spacing?
   ii. What kind of tree or crop rotations can be used over time?

5) What management practices are recommended?
   i. How and when should trees be established?
   ii. How and when should trees be trained, pruned, pollarded etc.?
   iii. How should associated crops be managed?
iv. How and when should different tree products be harvested?
v. How and when should tree products be removed or replaced?

6) What technology performance can be expected?
   i. What yield of tree products can be expected and when?
   ii. What yield of associated crops can be expected?
   iii. What service functions will be performed (e.g. erosion control)?
   iv. What economic returns can be expected? How do risks change?

7) What inputs are required?
   i. How much planting material, labour, cash and land are needed?
   ii. What management skills are needed?
   iii. What infrastructure is needed for inputs, training or marketing?

3.6.4.0 Agroforestry Applications

Farming System

3.6.4.1 Agroforestry is a way of natural resource management towards sustained livelihood security. Hence, the resource management issues must be influenced by other available production systems. A major shift might be expected in agricultural production through diversification. These shifts in production system will get further boost because of integration of world markets, urbanization and rising personal incomes. Further, to design appropriate farming systems suited to diverse farming situations, farmers’ participation beginning from planning till execution of research and development programmes will be inevitable and they would actually participate in research and extension efforts as foremost partners. In rainfed arid ecosystems, integration of livestock and horticultural crops with annual crops, especially their organic production, is expected to emerge as a major Agroforestry system.

3.6.4.2 Multipurpose Trees are more or less integral part of Agroforestry farming systems. These have been defined as trees and shrubs which are deliberately grown or kept and managed for preferably more than one intended use, usually economically and/ or services in any multipurpose land use system, especially Agroforestry systems. Multipurpose trees provide various uses such as food, fodder, timber,
fuelwood, medicines, resins, gums, etc. Besides, these also provide some indirect benefits such as biological nitrogen fixation, Vascular Arbuscular Mycorrhizal symbiosis, reduction in soil erosion, increase in water percolation etc. in the form of environment improvement. India is characterized by having wide range of rainfall patterns. As mentioned earlier, suitable multipurpose tree species according to rainfall distribution are given in Annexure V and classification of multipurpose trees based on rotation cycle is given in Annexure VI.

3.6.4.3 Feeds providing energy, protein, fat, carbohydrate, vitamins and minerals to animals, derived from grasses, tree foliage, straw, tuber etc. grown in Agroforestry systems are fundamental to livelihood security in arid zones. Besides tree fodder, some other Agroforestry products are also used as components of feed formulations and many of these are not yet properly evaluated for their potential to become a part of regular diet of animals/poultry birds. It has been estimated that fallen leaves, flowers, fruits, seeds, etc. available in various Agroforestry systems can make up to more than 50% of the complete feed for ruminants and about 10% of the feed of non-ruminants. Tree fodders are able to provide the fodder in terms of the amount and the nutrients, but the presence of antinutritional factors in many of them makes them unfit for sole use. There is a need to utilize tree fodder/feed optimally and in combination with other commonly used fodder/feed. Systematic research is needed to reduce the antinutritional factors to manageable levels. Extension agencies and animal feed suppliers should be aware of the use of the balanced animal feed and inform the farmers accordingly. Each KVK should have trained staff in animal nutrition and production and impart necessary trainings to the farmers and other stakeholders.

Resource Conservation

3.6.4.4 Water is a critical element for reclamation of degraded lands for sustainable biomass production, ultimately leading to a better quality of life and enabling conditions. Watershed management is an approach for area planning of natural resources, especially land, water and plants, to meet socio-economic needs of human society. Emphasis should be on micro-watershed management plan integrating
protection of the resource base and creation of assets, improvement of productive systems, generation of employment opportunities and ensuring higher income on a recurring basis. Degraded lands because of many limitations can only be improved through Agroforestry, which control erosion, reduce run-off, improve in-situ soil-moisture conservation, increase water-table but also improve productivity as well as profitability. Researches involving Agroforestry are required on many areas like watershed hydrology, control of sedimentation, situation-specific cost-effective technologies, production of fodder, forages, industrial grasses and medicinal plants for quick-return and livestock improved production for harnessing maximum benefits from limited biomass.

3.6.4.5 The power of trees in bringing changes can be illustrated by one simple study. Between 1991-92 and 1997-98, canal side plantations in Jaisalmer (Rajasthan) were undertaken on a total of 401 sites covering an area of 9,271 ha. These plantations have brought significant reduction in blown sand deposition in canal (Table 2). Consequently, the cost of desiltation was greatly reduced. For instance, for the Sagarmal Gopa Sakha, the net saving on desiltation had increased from Rs. 12,886/ km in 1997 to Rs, 19,755 in 1999.

Table 2. Reduction in Blown Sand Deposition in Canal (m3 Km⁻¹) after Canal Side Plantation

Carbon Sequestration

3.6.4.6 The Inter-Governmental Panel on Climate Change (IPCC) has been asserting that the earth’s climate is changing and that its impact will be great on developing countries. To meet this global challenge of climate change, many
countries and institutions have been working with a focus on analyzing the impacts, prospects for adaptation and opportunities for mitigation. India is a signatory to the Kyoto Protocol (1997), which asserts that the country will play an important role in mitigating the effects of global warming. Use of Agroforestry systems, as a mitigation strategy, is a key through a major opportunity for carbon sequestration. Concerted efforts are required to identify practical cost effective means through changes in land-use practices using Agroforestry as an option. India must be able to clearly demonstrate that, with the use of appropriate Agroforestry and other agricultural production systems, the country has improved the carbon balance and atmospheric health and should seek necessary rewards in the global market.

Bio-diversity Conservation

3.6.4.7 India is an important centre of biodiversity, housing over 45,000 plant species and 810,000 animal species, representing 7% of the world’s flora and 6.5% of the world’s fauna. The UN Convention on Biological Diversity calls for conservation of the biological diversity, sustainable use of its components and fair and equitable sharing of benefits arising out of the utilization of genetic resources. Agroforestry innovations contribute to bio-diversity conservation through integrated conservation-development approach. Forest degradation has caused immense losses to the bio-diversity, which can be conserved through Agroforestry by adopting a strategy of conservation through use. The bio-diversity thus conserved shall help in the development or improvement of new varieties or populations and provide new Agroforestry options.

Improvement in Soil Fertility and Structure

3.6.4.8 Plantation of compatible and desirable species of woody perennials on farmland results in an improvement in soil fertility. There are several possible mechanisms of this, which include:

1. Increase in organic matter content of the soil through the addition of leaf litter and other plant parts;
2. More efficient nutrients cycling within the system and consequently more efficient utilization of nutrient that are either inherently present in the soil or externally applied;
3. Biological nitrogen fixation and solubilization of relatively unavailable nutrients, e.g. phosphate through the activity of mycorrhiza and phosphate-solubilising bacteria;
4. Increase in the plant-cycling fraction of nutrients, with their resultant reduction beyond the nutrient-absorbing zone of the soil;
5. Complementary interaction between the component species of the system, resulting in a more efficient sharing of nutrient resources among the components;
6. Enhanced nutrient economy, because of different nutrient-absorbing zones of the root system of the component species; and

3.6.4.9 Improvement in the organic matter status of the soil can result in an increased activity of the favourable microorganisms in the root zone. Inclusion of trees and woody perennials on farm lands can, in the long run, result in marked improvements in the physical conditions of the soil, e.g. its permeability, water-holding capacity, aggregate stability and soil-temperature regimes.

3.6.4.10 The role of trees in soil conservation and erosion control is one of the most widely acclaimed and compelling reasons for including trees on farm lands prone to erosion hazards. The influence of trees on hydrological characteristics can extend from the microsite to the farm and regional levels.

3.6.5.0 Agroforestry Systems in the Country

3.6.5.1 Agri-silviculture, agri-horti-silviculture, agri-horticulture, hortipastoral, silvipastoral and some other specialised combinations for specific conditions are the major Agroforestry systems practised in varying intensities in different agro-climatic
zones (Annexure VII). Agrisilviculture and agihorticulture are the overall most popular Agroforestry systems. The detailed situation in different agro-ecological regions is described below.

**Eastern-Himalayas**

3.6.5.2 The indigenous tribes like Lepcha and Limbu used to collect large cardamom from natural forests, which were later on domesticated. Among three dozen shade tree species in large plantation areas, alder (*Alnus nepalensis*) is most abundant and preferred tree, which is a non-leguminous nitrogen fixing tree. Besides large cardamom, many food crops like maize, millet, potato, barley, chillies and colocasia are grown with alder. The tree not only provides shade to arable crops, timber and fuelwood but also ameliorates the soil and protects it from erosion on hilly slopes. A yield of 400-500 kg ha\(^{-1}\) of cardamom has been reported in a year under shade trees. If a village with 100 families could set aside about 120 ha of land to grow alder trees, all families would be able to get sufficient fuelwood every year and at the same time raise crops under the alder in about 30 ha area every year. Cultivation of coffee, ginger, cardamom, turmeric and medicinal plants under the shade of naturally growing trees in Meghalaya is one of the best examples of successful combination of trees with annual crops.

3.6.5.3 Besides the above system, many trees are lopped for their green fodder which is rich in crude protein and calcium. These are found grown on terraces which are widely spaced, thus causing least yield reduction of inter-crops. Different trees provide fodder at different times of the year sustaining the supply of fodder throughout the year. Among the introduced tree species, *Leucaena leucocephala* (var. S 11) does well at low to mid hills and it could produce 9 t ha\(^{-1}\) dry foliage annually under the stocking density of 2500 trees ha\(^{-1}\). In low to mid hills, mandarin orange is a commercial fruit crop which is intensively intercropped with annual food crops, mainly maize. In Meghalaya, pear, plum and peach, and in Sikkim, apple are intercropped with food crops like potato, maize, vegetables, peas and mustard. At some places pineapple is also grown as an intercrop. Among monocrops, tea plantation is common in pockets but now cherry (*Prunus cerasus*) is also planted as
live fence. Shade trees like *Albizia chinensis* may be grown for desired quality of tea which has been reported to add 2.5 to 5.0 t ha\(^{-1}\) organic matter to the soil annually containing 63-126 kg N, 18-36 kg P\(_2\)O\(_5\), 22-44 kg K\(_2\)O, 32-64 kg CaO and 16-32 kg MgO per ha. Department of Agriculture in Mizoram has developed its own contour trench-farming for jhum areas on hills where top portion is of undisturbed forest, middle portion is with horticultural crops and down the hill, terraced rice is cultivated with pineapple and grasses on contours. Many species of bamboo, palms (coconut, arecanut and species of *Licuala, Phoenix, Wallichia, Corypha, Caryota*) and rattans (*Calamus* spp.) are cultivated widely in north-eastern areas as mixed or boundary plantations. Pasture in forests is also a common practice. In Sikkim on hilly areas, Nevaro (*Ficus auriculata*) based silvipastoral systems have shown production potential of 15.6-51.6 t ha\(^{-1}\) annually and goats could be reared successfully.

3.6.5.4 It has been found that sericulture based system is highly relevant for these areas. Mulberry with frenchbean-groundnut followed by mustard is a profitable cropping system with mulberry, guava/lemon/pear and pineapple in paired rows and grasses on the bunds is an ideal system for silk production and additional income from fruits and cattle rearing. Pedi-cum-sericulture is said to be more viable as the cash returns are more frequent.

**Western Himalayas**

3.6.5.5 In the Western Himalayas, 60 to 70% requirement of the firewood is met from the arboreal components and several MPTs along the bunds of agricultural lands or scattered trees on the pasture lands were developed depending upon the needs, economics and environmental status of the land. High rate of net primary productivity has been reported in agri-hortisilvicultural systems (206 t ha\(^{-1}\) yr\(^{-1}\)) or agri-horticultural systems (23 t ha\(^{-1}\) yr\(^{-1}\)) and the species number in these systems is as high as 15 tree species. Generally 50 to 100 trees are planted in a hectare for fulfilling a part of the fodder and fuelwood requirements. *Grewia optiva, Celtis australis, Bauhinia variegata, Albizia chinensis, Bombax ceiba, Melia azedarach* and *Toona ciliata* are common MPTs while plum (*Prunus domestica*), apricot (*P.
armeniaca), peach (P. persica), almond (P. dulcis) and pear (Pyrus communis) are common fruit trees of these systems. Hedge-row intercropping is feasible and important on sloping hilly lands when pruned biomass during cropping season can be used for fodder and fuelwood. Kinnow based horti-silvi-agricultural system at Dhaulakuan, kinnows planted at a spacing of 5m x 5m, has been highly successful. The inter-row spaces were utilized for sowing Leucaena leucocephala in the form of hedge rows or scattered trees and maize, soyabean, vegetables and wheat were grown as annual crops. To accommodate the demand for wood for packing of horticultural produce in the region, a horti-silvi-pastoral system was also developed growing trees of Santa Rosa plum at a spacing of 8m x 8m and the interspaces and field boundary were utilized for growing Populus deltoides with excellent economic returns. The strategy to develop Agroforestry systems in Western Himalayas should be based on the economy of fruits supplemented with cattle, keeping in view the soil conservation aspect. Therefore, fruit trees must be grown with forages, crops, vegetables and MPTs on small watershed basis. The timber woodlots for supporting cottage industries may help to improve the socio-economic status of rural people.

Indo-Gangetic Plains

3.6.5.6 This region contributes 51.9% to the national food grain output. Farmers use trees according to their need as well as suitability of the species. Many common trees such as Azadirachta indica, Acacia nilotica, Dalbergia sissoo, Prosopis cineraria, Eucalyptus tereticornis and Populus deltoides are found grown very frequently on farm lands particularly along crop-field boundaries. Some of the common systems found in this region are briefly described below:

Agroforestry Systems for Salt Affected Soils

3.6.5.7 A sizable area in the Indo-Gangetic plains is salt-affected. A package of afforestation techniques has been developed by the Central Soil Salinity Research Institute, Karnal. To rehabilitate alkali soils, augerhole technique is used for planting the saplings of salt tolerant species using 8Kg FYM + 3 Kg gypsum + 10 g ZnSO$_4$ and insecticide powder for controlling termites. In long-term experiments it has been
found that on highly alkali soil (pH>10) *Prosopis juliflora*, *Acacia nilotica* and *Tamarix articulata* can be grown with success. On soil of moderate alkalinity (pH 9-10), species like *Eucalyptus tereticornis*, *Parkinsonia aculeata*, *Terminalia arjuna*, *Pithecellobium dulce* can successfully be grown. Among fruit trees, aonla (*Emblica officinalis*), guava (*Psidium guajava*), ber (*Zizyphus mauritiana*), Karonda (*Carissa carandas*), Jamun (*Syzygium cumini*) and pomegranate (*Punica granatum*) on raised bunds may be grown applying higher doses of gypsum and farm yard manure. These species may be blended with forage grasses like *Leptochloa fusca*, *Brachiaria mutica* and *Chloris gayana*. Among herbs of industrial application, species like *Matricaria chamomila*, *Cymbopogon martinii* and *Plantago ovata* may be grown on moderate alkali soils.

3.6.5.8 On saline soils furrow-method of planting trees has been found successful. *Acacia nilotica*, *A. farnesiana*, *A. tortilis*, *Prosopis juliflora*, *Parkinsonia aculeata*, *Casuarina glauca*, *C. equisetifolia*, and *Tamarix tropii* have been found most suitable. *Eucalyptus camaldulensis* is also quite successful. On partially reclaimed lands, *Populus deltoides* and *Eucalyptus tereticornis* are grown as boundary plantations. *Populus deltoides* is preferred on agricultural lands also.

**Agroforestry Systems for Soil Conservation**

3.6.5.9 In ravine lands, trees like *Acacia nilotica*, *A. aburnea*, *A. catechu*, *Prosopis juliflora*, *Dalbergia sissoo*, *Azadirachta indica* and *Pongamia pinnata* are most effective in association with forage grasses like *Dichanthium annulatum*, *Bothriochloa pertusa*, *Cenchrus ciliaris*, *Chrysopogon fulvus*, *Cynodon dactylon*, *Sehima nervosum* and *Panicum spp*. *Eucalyptus* – Bhabar grass (*Eulaliopsis binata*) system has been found quite efficient in the Shivaliks which showed the highest economical returns and negligible soil loss (0.07 t/ha) followed by *Acacia catechu* – forage grass (0.24 t/ha) followed by *Leucaena* – napier grass (0.28 t/ha) system. Besides less soil loss, runoff and nutrient losses were also less under Agroforestry systems as compared to those under arable crops. *Vetiveria zizanoides* is also an excellent soil binder.
Agroforestry for Controlling Seepage from Canals

3.6.5.10 Seepage from unlined canals results in waterlogging and salinization. For example, in Hisar Agricultural University Farm, water table has been reported to rise from 15.92 m in 1967 to 1.56 m depth in 1982 after the introduction of Bhakra canal in 1963. A wide belt of trees such as *Eucalyptus tereticornis*, *Populus deltoides*, *Syzygium cumini*, *Pongamia pinnata*, *Terminalia arjuna*, *Dalbergia sissoo*, *Acacia auriculiformis* and *A. nilotica* on both sides of the canal may be created to utilize the seepage water for biomass production. Perennial grasses like *Brachiaria mutica*, *Coix lachryma-jobi*, species of *Paspalum*, *Echinochloa colonum* and *Leptochloa fusca* may be grown in waterlogged areas and may be used for forage. *Phragmites australis* a weed grass is also found growing in stagnant water.

Horti-pastoral and Agri-horticultura Systems

3.6.5.11 Mango (*Mangifera indica*), guava (*Psidium guajava*), Jamun (*Syzygium cumini*), and ber (*Zizyphus mauritiana*) are the important fruit yielding trees in the entire Indo-Gangetic plains. In Bihar region Litchi (*Litchi chinensis*) is important fruit species. In all these plantations in earlier years of their growth arable crops may be taken. In some areas these are left open for grazing of cattle. But the grazing should be stopped and forage grasses may be cultivated. Several Multi purpose species like *Madhuca indica* and medicinal neem (*Azadirachta indica*) have also shown their preference in most of the region.

Agroforestry in Humid and Sub-humid Region

3.6.5.12 In Tripura tree component is used along with livestock and poultry component, whereas in irrigated areas fish component is also incorporated. Agrisilviculture is common in Raipur and Ranchi areas. *Acacia nilotica*, *Terminalia arjuna*, *Butea monosperma*, *Albizia* spp. are grown in Raipur area while *Zizyphus mauritiana*, *B. monosperma*, *Aegle marmelos*, *Mangifera indica*, *Schleichera oleosa* (Kusum) in Ranchi area. Homestead Agroforestry is also being practised using *Gmelina arborea*, *Artocarpus heterophyllus*, *Madhuca latifolia*, *Zizyphus mauritiana*
etc.. In Bhubaneswar area agrisilviculture (*Cocos nucifera* for boundary plantation, block plantation of *Casuarina equisetifolia*, *Anacardium occidentale*) and homesteads are being practised. At both the centres (Raipur and Ranchi) *Gmelina arborea* is also used as timber while *Tectona grandis*, *Acacia nilotica* are used as timber trees at Raipur and *Shorea robusta* at Ranchi. *Leucaena leucocephala* is used at Raipur and Ranchi for fodder and *Pongamia pinnata*, *Acacia nilotica* and *Dalbergia sissoo* are also used as fodder at Raipur. *Mangifera indica* and *Artocarpus heterophyllus* are grown for fruits. Other fruit trees are *Moringa oleifera* and *Syzygium cumini*, in Raipur area and *Psidium guajava*, *Carica papaya* in and around Ranchi. *Terminalia arjuna* for raising silk worm and *Butea monosperma*, *Schleichera oleosa* for Lac cultivation are being used by the farmers in Ranchi area.

**Agroforestry in Arid and Semi-Arid Regions**

### 3.6.5.13

In most of the arid region of the north-western India, Khejri (*Prosopis cineraria*) based silvi-agriculture system is prominent. Almost in all the fields most useful khejri trees and small fruit yielding *Zizyphus nummularia* are found grown in association with rainfed crops. *Zizyphus nummularia* is used for its leaves as fodder for camel and goats and berries for edible purposes. *Acacia tortilis*, *A. nilotica*, *A. senegal*, *A. leucophloea*, *Capparis decidua*, *Tecomella undulata*, *Salvadora persica* and *S. oleoides* are other common trees found on various grazing lands or as sand stabilizers. *Calligonum polygonoides* is another interesting bush in Bikaner region. *Lasiurus sindicus* and *Cenchrus ciliaris* are prominent grasses in grazing fields as well as in sand dunes.

### 3.6.5.14

It has been found that besides above native species many woody perennials such as *Acacia albida*, *Hardwickia binata*, *Colophospermum mopane*, *Holoptelea integrifolia* and *Zizyphus rotundifolia* may form the constituents of silvi-pastoral or agrisilvicultural systems in these regions. Studies on the effects of native Khejri and exotic *Acacia albida* on grain production of moongbean and clusterbean, when planted in a space geometry of 5m x 5m, 10m x 10m, and 10m x 5m, showed that the average mean increment in height was 108.2 cm/tree/yr in case of *A. albida* and 14.5
cm/tree/year in *P. cineraria*. The latter did not show any interference in crop yield at any stage. However, *A. albida* during third year showed yield reduction of clusterbean. In wider spaces of 10m x 10m the yield was 1280 kg/ha which reduced to 650 kg/ha and 760 kg/h in spacing of 5m x 5m and 5m x 10m, respectively. Based on a long-term study it has been reported that *Zizyphus rotundifolia* did not show any negative effect on production of cluster beans, pearl millet, moongbean and moth bean, while *Acacia tortilis* had significant negative effect on crop yield. When fodder grasses were grown in combination with ber plants as well as *A. tortilis* tree, the fodder yield and seed production of crops were higher than the yield and seed production of crops in isolation. In Arid regions of Western India, introduction of compatible fuel, fodder and fruit trees in pastures as in agricultural fields acts as an insurance against frequent crop failures, and trees play a pivotal role towards peoples’ survival and sustenance in such fragile ecosystems.

3.6.5.15 In Central India, *Dalbergia sissoo, Acacia nilotica, A. eburnea, A. leucophloea, A. catechu, Albizia lebbeck, Azadirachta indica, Butea monosperma, Pongamia pinnata, Holoptelea integrifolia, Balanites roxburghii* and *Dichrostachys cinerea* form important constituents of a silvi-pastoral system. In black cotton soil region very tall grasses supporting this system include *Heteropogon contortus, Chrysopogon fulvus, Themeda triandra, Iseilema laxum, Dichanthium annulatum* and the industrial grass *Cymbopogon martinii*. These can make a sustainable silvi-pastoral system. During the assessment of the soil conservation values of some grasses and forbs in two phases it was found that *Dichanthium annulatum* showed maximum conservation value (upto 89) followed by *Cynodon dactylon* and *Bothriochloa pertusa*. In second phase, *Dichanthium caricosum* showed maximum value (94.4) followed by *Sehima nervosum, Cymbopogon martinii, Chrysopogon fulvus, Iseilema laxum* and *Heteropogon contortus* (all having conservation value of more than 83).

3.6.5.16 In semi arid regions of Peninsular India the systems are more complex as the problem of frost does not exist, therefore, a vast number of trees (both fruit yielding and MPTs) exist on agricultural fields. *Borassus flabellifer, Tamarindus
indica, Acacia leucophloea, A. catechu, Casuarina equisetifolia, Cassia siamea, Eucalyptus tereticornis, Albizia lebbeck, and many others are frequent trees on farms. *Leucaena leucocephala* has also been adopted as a common hedge-row-crop in many areas.

**Agroforestry Systems for Coastal and Island Regions**

3.6.5.17 Low lying water logged marshy areas, flood plains, and ill-drained lands are the common features in the coastal areas swamps and river banks are occupied by the mangroves and associate halophytes. Other natural vegetation includes evergreen, semi-evergreen and deciduous forests on uplands and grazing lands in pockets. Plantation crops integrated with livestock and poultry and rice fields are main features of this region.

3.6.5.18 The systems and practices of Agroforestry range from apparently ‘simple’ forms of shifting cultivation and farming in forests to sophisticated hedgerow intercropping systems, from systems involving sparse stands of trees on farm lands to high density, complex multistoreyed homegardens of lowland; and from systems in which trees play a predominantly ‘service’ role (e.g. shelterbelts) to those in which they provide the main commercial product (e.g. intercropping with plantation crops). Most of the systems are site-specific with very few examples of their extrapolatibility.

3.6.5.19 Though many scientific inputs are given to plantation crops and multiple cropping systems are adopted but quite large areas under coconut plantation are still neglected and remain open for grazing. These areas may be brought under multistoreyed cropping systems. Spices like clove and cinnamon may be planted as middle storey crops and pineapple or forage grasses like hybrid napier (*Pennisetum purpureum*), kazungula (*Setaria anceps*) and guinea (*Panicum maximum*) and legumes like *Stylosanthes guianensis* or industrial grasses like lemon grass (*Cymbopogon fulvus*) may be grown as cover crops. Rubber and red oil palm plantations may also be integrated with other spice or forage crops particularly the legume covers. Monoculture of plantation crops should be discouraged and a multi-
storeyed plantation system should be raised as has been demonstrated in Jirka Tang Farm in Andaman where even the forest-trees are retained in multi-storeyed plantations and almost all plantations including spices, coffee and fruit trees have been accommodated as under-storey crops.

### 3.6.6.0 Socio-Economic Aspects

#### 3.6.6.1 The main socio-economic outcomes of Agroforestry development programmes in the country may be summarised as below:

- Rehabilitation of >1 million ha salt affected wastelands through Agroforestry.
- Eucalyptus plantations in over 3.1 million ha.
- Indo-gangetic region having > 1 mililiion ha Poplar/ Eucalyptus- 6-8 years rotation; 108 personday/ha post-harvest employment in Poplar (See Box I).
- Small holders emerging as the timber suppliers of the 21st century.
- 30 million trees of poplar producing 1.125 million m³ industrial wood annually are standing in Uttar Pradesh, Haryana, Uttaranchal, Punjab, Himachal Pradesh and Jammu and Kashmir with agricultural crops (equivalent to 60,000 ha pure plantation @ 500 trees ha⁻¹).
- 25000 ha equivalent plantation of Poplar are now being established every year under Agroforestry situation with 6-8 year rotations.
- >10 million ETPs (Entire transplants)/year grown in nursery; against this, current requirement is > 15 million ETPs/year.
- >7000 ha of degraded forest lands in Andhra Pradesh planted with improved Eucalyptus clones; >35000 ha marginal lands/year being planted in Andhra Pradesh.
- **Prosopis juliflora-based** fuel and charcoal making; in Tamil Nadu alone 6.34 million mandays and 7.03 million womandays employment created by using this system.
- TBOS (Tree Bearing Oil Seeds) potential in India is 52.33 lakh MT with employment to 0.44 million people.
- Silvipastoral system on an average cycle of 10 years could generate 120 mandays/ha/year employment.

**Box I. Post Harvest Employment in Poplar/ha (108 personday/ha)**

3.6.6.2 The Planning Commission Report of “The Task Force on Greening India for Livelihood Security and Sustainable Development” (2001) provides economic analysis of 24 Agroforestry models being practiced in different agroclimatic conditions of the country. They all reflect a high Benefit / Cost ratio (1.5 to 3) and Internal Rate of Return (15 to 40%). An ICAR study has revealed a B:C ratio of 3.0 in case of Poplar based agrisilvipasture in Western Uttar Pradesh. The other findings from the region with major policy implications are as follows:

3.6.6.3 *Traditional Agroforestry sub-region*

- The bound/border system of Agroforestry was the most common practice in the region with tree species like *Azadirachta indica* and *Acacia nilotica*. The tree stock was 15.6 per farmer and the tree density was inversely proportional to the land holding.
- The fuel wood needs prompted majority of the farmers (50.6%) to patronize the trees on farmlands. The other major reason was supplementary income (24.4%).
• The annual mean wood produced and harvested worked out to 0.42 t /farm household. Out of this the marketed surplus was almost 49 per cent. While 51 per cent of the farmers harvested some tree/tree produce in the past three years, only 37 per cent of such farmers had marketed surplus. The tree/tree produce was mostly disposed off by the farmers to the local traders. Often the village traders bought the same and the tree produce reached the nearby urban markets for processing and consumption.

3.6.6.4  Intensive Agroforestry sub-region

• Field bound/boundary plantations of trees was predominant (78.1%) followed by agrisilviculture (21.9%). The most common tree species are Poplars (Populus deltoids) and Eucalyptus tereticornis hybrids. While the former was seen on bunds and under agrisilviculture, the latter was solely seen on bounds/boundaries of agriculture fields.

• The tree density worked out to 146 trees/ha under bund system with 64 per cent of Poplar and 33 per cent of Eucalyptus tress on an average. The tree density was 481 trees/ha in case of Poplar - based agrisilviculture.

• Private nurseries accounted for majority source (40.7%) of planting material for Agroforestry. The forest department and the corporate sectors extended the technical know-how (68.1%) for tree cultivation under Agroforestry.

• Monetary considerations mostly dominated (88.8%) the decision making in favour of Agroforestry by the farmers.

• The Benefit Cost Analysis indicated that higher B:C was in case of Poplar - based agrisilviculture with 3.00 followed by bund system with Poplar at 2.84.

• There is general decline in the prices of wood especially Poplar by about 14-30 per cent over the period 1996-2000. This decline was further alarming in the next couple of years. This is mainly due to decrease in demand for the plywood as well as increase in Poplar area. The same has to be checked may be by announcing a minimum support price, as the same would reduce the drain of foreign exchange in the form of reduction in timber imports to some extent.
3.6.6.5 **Boxes II and III** give socio-economic profile of a Poplar-based Agroforestry project in Yamunanagar (Haryana). It may be seen from the **Box II** that the adoption rate of the technology is extremely high, especially in irrigated lands, and the average income of the adopters is almost three times of that of the non-adopters. As seen from **Box III**, when Agroforestry households were located close to forest, the income was almost proportional to farm size, but if located far away from forest, the income of small households almost tripled and those of medium and large households increased only by about 15 and 3 percent, respectively. Inclusion of livestock in Agroforestry systems increased the income considerably and the increase was almost proportional to the number of animals owned by the households, and the increase was much larger when the farming households were away from forest.

**Box II. Poplar Based Agroforestry in Yamunanagar (Haryana)**

- Agroforestry is more popular in the villages which are far away from the forest area. Around 61% households of the villages away from the forests received their income from the trees of Agroforestry whereas only 35% in the villages near the natural forests.
- Landless farmers get equal benefit from Agroforestry. The average annual income of the households from the trees of Agroforestry and natural forests increases as the holding size increases in both the groups of villages.
- Economic dependence on trees income increases with increasing family size and number of animals in both the groups of villages (near and away from the natural forests). But the trend is reverse in case of natural forests.
- Rate of adoption in the villages far away from forests is 94% as compared to households of the villages near the forest boundaries.
- Around 48% households use Agroforestry for getting wood as a source of cooking.
- The overall percentage of farmer households adopting Agroforestry for the irrigated land increases with increasing holding size i.e., from 87.61% to 99.14%, whereas, for unirrigated land this percentage of households is comparatively low i.e., from 69.81% to 95.65%.
- Level of education plays a dominant role in increasing income from the Agroforestry. Percentage contribution is slightly higher 80.63% in case of educated farmers whereas it is 79.02% in case of illiterate farmers.
- Most of the medium and large farmers adopted Agroforestry as a major source of income.
- The overall income from Agroforestry in villages away from natural forests is more (86.5%) compared to villages near to forests (76.41%). The overall annual income from trees of Agroforestry is Rs. 8377 for adopted households whereas corresponding income for non-adopted households is only Rs. 2638.

*Source: Rai et.al.(1999)*
3.6.6.6 A study on economic impact of Subabul (*Leucaena leucocephala*) based farming system (Agroforestry) was undertaken in four districts viz., Khammam, Krishna, Guntur and Prakasham of Andhra Pradesh. Three land uses and land cover changes were type I- Subabul for pulp wood; type II- Subabul with intercrops; and type III- Subabul with animal husbandry and intensive fodder use. Their adoption rates are, 29.7, 23.3 and 47.1 per cent, respectively. The economic analysis indicates that Type III farmers earn higher returns, B: C ratio of 3.67 as compared to B: C ratio of 1.88 to 2.58 in Types I and
II (Table 3). As suggested by the study, several of the type-I and type-II farmers are shifting to the type-III system for better cash flow. Subabul leaf meal production was identified as another significant opportunity to supply the fodder from areas like Guntur and Khammam to fodder deficit areas like Praksham districts with intensive fodder use. This activity can provide employment opportunity to the unemployed youth on the one hand and better resource use along with nutrition on the other. The role of institutional credit support and an effective extension system was substantial in achieving the success. Such experiences should be replicated widely.

3.6.6.7 With the fossil fuel prices soaring so high, jeopardising overall economic growth in petroleum importing countries, the country must develop its own renewable energy production and use system, of course, consistent with economic viability and technological feasibility. The agro-technological and socio-economic prospects of some of the potential species, especially *Jatropha* for fuel and *Prosopis juliflora* for bio-energy, should critically be examined and timely necessary actions should be taken to harness the potential. The All India Coordinated Research Project on Agroforestry centres at their Andhra Pradesh, Tamil Nadu and Karnataka Agricultural Universities have collected germplasm of *Jatropha*, Karanj and other biofuel species and are evaluating them. Agrotechniques for improved production of the selected genotypes are being standardised.

3.6.6.8 In fact, *Jatropha* plantations are being raised in several States, mainly in Chhattisgarh, Uttaranchal, Andhra Pradesh, Tamil Nadu, Karnataka and Haryana. But, often, the quality of the planting materials is poor and the expected results in terms of yield and income are not being realised. Efforts should be focused on developing superior and stable genotypes (high yielding varieties). Nurseries should be established at strategic locations for production and distribution of quality planting material. In vitro culture facilities should also be available to hasten the pace of multiplication of elite materials.
Table 3: Relative Economics of Raising Subabul (3 Year Rotation) in Different Typologies of Andhra Pradesh

3.6.6.9 A refinery is being set up by ‘D’- Oils - a British Company in Chennai with 8000 t / yr production capacity. The refinery is expected to start functioning by
2007. As we know, in Karnataka, biodiesel is used in generators for supplying electricity to a number of villages since 1998. This model of decentralized production of energy is ideally suited for Indian conditions for linking agricultural production with agroprocessing and value addition, besides generating additional rural employment. It is estimated that Tree Borne Oil Seeds (TBOS) potential in India is over 5 million tonnes with an additional employment potential of 0.44 million people.

3.6.6.10 As regards bio-energy, *Prosopis juliflora*, which was considered as an abnoxious weed in certain areas, is now being cultivated as an Agroforestry species in large areas in Andhra Pradesh, Gujarat and Karnataka. The total area in three districts of Gujarat (Bhuj, Patan and Surendranagar) is 1.71 lakh ha (2005), with a potential of 1.53 lakh t of charcoal production and 18.55 lakh mandays per rotation employment generation. For fuel and charcoal making, employment was generated for 6.34 million mandays and 7.03 million womandays in Tamil Nadu. *Prosopis juliflora* is a major source of fuel for boilers of the power generation plants in Andhra Pradesh. Rs. 700-1300 /t is the price offered for its wood at factory gate depending on the season and moisture. Three plants in A.P. have developed captive plantations of *Prosopis juliflora*. Commissioned biomass-based power plant capacity in Karnataka and Andhra Pradesh was 266 MW with 46 power generation units in operation, with almost 78% in Andhra Pradesh alone.

3.6.6.11 In coastal zones, mangroves are the most important bioresource and their use as a major source of bio-energy should be promoted through suitable institutional supports, while ensuring their comprehensive conservation and sustainability as bio-shield. A time-frame programme must be chalked-out for rehabilitation of mangroves along coasts. Techniques are available for planting of mangroves, a massive programme should be framed and implemented without further waste of time. More agro-based industries should be developed in coastal areas to create more employment through value addition to products based on coconut, oil palm, honey, cashewnut, rubber, fruit, fish & shrimp, milk, beverage, medicines, poultry, sea food and mangrove products.
3.6.6.12 The total CO$_2$ emission reduction potential (as a consequence of not using
the coal in thermal plants) of the biomass based power plants (on account of 16000
MW potential/yr) is 35.3 million t/yr. Although many plants have been
commissioned, they are yet to be registered with the UNFCC. As on March 6, 2006
only 2 plants from A.P. (18 MW) have been registered with UNFCC for a saving of
39670 t of CO$_2$ per annum. India should position herself effectively to harness the
environmental costing provisions under Kyoto Protocol.

3.6.6.13 Agroforestry will play a decisive role not only in supply of timber
products, thus saving the forest, but would also be extremely effective in meeting the
paper, pulp and viscose requirements. Per caput paper consumption per year in India
is less than one-sixth of that in China (Table 4). The demand is growing annually at 7
per cent and our capacity is growing at a rate of 4 to 5 per cent, necessitating huge
annual import. Agroforestry plantations could be expanded at wasted and degraded
lands through a Nucleus - Estate arrangement to meet this demand. The private sector
must play a proactive role in filling this gap.

3.6.7.0 Agroforestry Research and Technology Development

3.6.7.1 India has been at the forefront of Agroforestry research. Although
Agroforestry research in the ICAR system and other Indian institutes and universities
has been in progress since early 1950s, the Council launched the All India
Coordinated Research Project on Agroforestry in 1983. Presently, 36 centres (11
ICAR Institutes + 25 SAUs) representing all ago-climates in the country are involved.
The National Research Centre on Agroforestry, one of the ICAR Centres, was
established at Jhansi in 1988. The Indian Council of Forestry Research and Education
ICFRE) also supports Agroforestry research in education in various parts of the country. A number of State Agriculture Universities (SAUs) are also having focused research activities and education in the field of Agroforestry. Private sector initiatives in Agroforestry such as those by WIMCO, BAIF, IFFDC, ITC are worth mentioning. In all, more than 2000 scientists and technicians are engaged in Agroforestry research, development and education in the country. The main research and development outcomes are listed below.

- Characterisation of Agroforestry systems in different agroclimatic zones of the country; by developing a diagnosis and design approach and using them for survey, a benchmark information for major Agroforestry systems has been prepared.
- Collection and evaluation of multipurpose tree species – creation of arboretums in different agro-climatic zones.
- Tree selection and improvement particularly of Poplar, Shisham, Neem, Semal, Subabul and Eucalyptus.
- Priority Agroforestry tree species were identified for different agroclimates.
- Management practices for different Agroforestry systems were standardized and their efficacies and economic returns (B:C ratios) were worked out to show the usefulness of the systems under specified agro-ecological and socio-economic settings.

3.6.7.2 The ICAR system has analysed the strength, weaknesses and opportunities of Agroforestry research and development system in the country (Table 5). Based on this analysis and keeping in mind the new national and international developments, increasing domestic demand for pulp and paper and other forest products, the overall objectives of the Agroforestry Research and Development Programme of the ICAR, announced recently, are quite sound, as given below:

i. Enhancing the output of specific products such as fodder, fuelwood, pulp wood, small timber and crop yield;

ii. Improving the overall productivity of small farms with minimum external inputs in different agro-ecological regions;
iii. Devising management techniques that can facilitate profitable use of degraded and unproductive land; and
iv. Providing environmental amelioration through watershed protection, soil conservation etc.

Source: ICAR, 2005
3.6.7.3 In order to achieve the above objectives, the following thrust areas have been identified:

- Increase wood resources to meet the growing needs of households and industries.
- Environmental amelioration through the carbon sequestration, bioremediation and resource conservation.
- Enhance livelihood and employment avenues.
- Technology transfer and human resource development.

3.6.7.4 In addition, the following specific areas deserve attention:

- Aqua-culture research keeping mangroves intact.
- Genetic improvement of identified potential multi-purpose trees.
- Organic farming, mycorrhizae in relation to Agroforestry and integrated pest-management in Agroforestry.
- Developing net-works for transferring proven technologies to the farmers.
- Developing decision support systems for replication of successful Agroforestry systems/practices.
- Exploring unexploited and under-exploited species of high economic value, such as medicinal, aromatic, oil-yielding plants etc.
- Exploring marine algae or sea weeds for food, medicine and green manure.
- Viable techniques for rehabilitation of degraded salt-affected areas involving good quality forages, MPTs, plantation crops and plants of industrial application, with due attention to quality assessment of the products obtained from saline habitats.
- Saline agriculture, including conjunctive irrigation with saline water, developing halophytic crops involving fish, shrimp culture and poultry with Agroforestry
systems, genetic improvement of salt-tolerant plants, raising nursery with saline water and multiplication and conservation of useful genetic material.

- Promotion of national and inter-national collaborative research programmes.

3.6.7.5 Analogous programmes are being pursued by other concerned agencies such as the Indian council of Forestry Research and Education, Wasteland Development Board, the Ministry of Environment and Forest etc, including the initiatives on biofuel and bioenergy in several Departments. However, there is little convergence and coordination among the various programmes. The Planning Commission may evolve an effective mechanism for synergistically linking and managing the linkages among the various programmes.

3.6.7.6 An integrated approach is necessary for research and development of coastal zone agriculture and Agroforestry which can impart sustainability to the productivity and save the fragile coastal ecosystems from degradation. A national information system may be launched to serve as the data bank of coastal zone planning. Environmental laws should be followed strictly in coastal zones to check the over exploitation of land, water and vegetation, particularly the mangroves.

3.6.8.0 Policy and Institutional Supports

3.6.8.1 The country’s mission on Agroforestry must be to advance the science and practice of Agroforestry towards a massive increase in the use of working trees on working landscapes, especially by smallholders rural households, to help achieve sustained livelihood security. Agroforestry efforts at the national level should strategically focus on tackling poverty, food security and environment through the following four channels:

i. Overcoming natural resource degradation in intensive productive irrigated systems;

ii. Arresting land degradation and productivity loss in small holder farms in sub-humid and semi-arid areas;
iii. Searching for sustainable alternatives to slash and burn in tropical humid areas;

iv. Providing shelter belt and livelihood security in coastal areas.

All the above issues can be addressed through the following four interdependent approaches:

- By seeking to understand the basis for sound land management, and then quantifying the long term consequences of Agroforestry practices on small scale agriculture so as to develop locally relevant land management options. Thereby, it should provide innovations that built a sustainable platform for achieving food security and income through increased production of Agroforestry products for home consumption and sale.

- By delivering approaches, strategies and methods for product development, tree domestication and access to high quality germplasm, and diversification of integrated farming systems in response to farmers’ needs. Agroforestry efforts at the national level should, therefore, be able to provide innovations that enable farmers to diversify their enterprise to capture market opportunities and provide nutritional and health benefits.

- By examining the role of Agroforestry and landscape mosaics in generating environmental services, reducing deforestation and aiming to improve related institutions and incentive and reward systems. This way we should be able to open up broader market linkages between farms and society’s needs for a better environment, as also to buffer farmers against the effects of climate change, and facilitate appropriate recognition of social costs and benefits.

- By strengthening of Agroforestry R and D institutions, and human resources development and education, we should be able to build institutional capacity in generating and applying innovations.

3.6.8.2 Appropriate policies and their effective implementation (governance) is important for realising benefits of Agroforestry. Many rules, regulations, tariffs and conflicts between States and communities have been major hurdles in the growth of tree culture. Enabling mechanisms and services, such as land rights, appropriate
technologies, credit support and market access must be synergistically intertwined with the production systems.

**Regulatory Aspects of Tree Felling and Transport**

3.6.8.3 State regulations and permit systems for felling of trees and for timber transportation have been main interferences in marketing of timber grown on farmers’ land by private investment and have been major discouragement to the expansion of Agroforestry. The rules and procedures for felling, transport and sale of major farm forestry species should be totally liberalised, and the local Panchayati Raj institutions should be delegated with powers to issue necessary permits, if any at all. At present, there is wide variation in the initiatives taken by different States. It is high time to evolve common guidelines on these issues, simplify the process and remove red tapeism. Policies on inter-state transport of farm forestry produce also require simplification and streamlining. This will facilitate easy movement of farm forestry produce from production to consumption areas. The existing state monopoly on trade of commercially important non-timber forest products (NTFPs) should be reviewed with a view to promote greater private sector participation in NTFP production.

3.6.8.4 The practice of supply of forest produce to industry at concessional long term leases should cease as it distorts the market and works against the interest of private Agroforestry. Import of pulp and timber was placed in open general licence (OGL) list and tariffs are not applicable since 1985. This was done to prevent deforestation in the country. While the deforestation continues unabated, the price distortions negate private efforts. Out of over 270 paper mills, hardly eight are producing or procuring pulp locally and desired private investments are not forthcoming to raise soft wood on wastelands and agricultural fields.

3.6.8.5 Raising of agro forestry species on forest lands by the government should be discontinued as the same can be grown more easily and efficiently by the farmers on their farmlands. Apart from directly affecting the farmers’ market, this also acts as a hindrance to liberalisation of felling and transit rules pertaining to these species.
The government should consider revoking the ban on export of wood-based products and imposing a higher duty on import of wood-based raw material to safeguard the interest of the domestic producers. Further, the industry may be given some concessions in excise or sale tax. In this way, domestic production will be encouraged and industries will also have greater incentive for improving wood conversion ratios and overall efficiency and competitiveness.

3.6.8.6 Availability of quality seedlings, seed and other planting materials and their initial establishment in the field resulting in recommended population density are fundamental to productive Agroforestry. Often, the quality and success rate of seedlings supplied by the government either free or at heavily subsidised rates is low, thus is a drain to the public funds meant for Agroforestry promotion. There is an urgent need to review this policy. Part of the resources should be reallocated for developing and producing high quality clones and seedlings which may be supplied on reasonable rates to farmers and backed up by suitable extension efforts, including setting up of demonstration plots and Farm Schools. The farmers will not mind procuring the planting materials at reasonable rates as long as these are certified stocks of high quality.

Marketing Infrastructure and Economic Incentives

3.6.8.7 Marketing of farm forestry produce is not organized. No forest-based industries, except that at the village or cottage level should be permitted in the future unless it has been first cleared after a careful scrutiny with regard to assured availability of raw material. In any case, the fuel, fodder and timber requirements of the local population should not be sacrificed for this purpose.

3.6.8.8 As more farmers take to Agroforestry, a system of market regulation along the lines of agricultural markets needs to be put in place. In the absence of such a regulatory mechanism, the volatility of markets may result in collapse of the Agroforestry industry. While the Agricultural Marketing Cooperative system introduced in Andhra Pradesh is a laudable first step, it is required to adequately
regulate the farm forestry markets and to protect the interest of both the producers and consumers.

3.6.8.9 In addition to the regulation of wood markets, a suitable market information system along the lines of agricultural markets is called upon to inform the farmers regarding major buyers, prevailing prices at different places, trends and procedures, etc. The Village Knowledge Centres should play a proactive role in collecting and disseminating necessary market information.

3.6.8.10 Introduction of positive incentives can go a long way in popularising tree farming. The Chandi Prasad Bhatt Committee, set up by the Ministry of Environment & Forests (November 1998) recommended introduction of national tradable afforestation credits to encourage tree planting by private land owners. These credits will allow tax benefits to the farmers. The small land owners who do not have any tax liability could sell these credits to others.

3.6.8.11 The standing trees on farm lands are exempted from wealth tax. It is an incentive to farmers for maintaining valuable trees on farms. However, the trees are not taken as collateral for grant of loan. The financial institutions should consider the issue of treating trees as collateral for grant of loan. Joint Pattas for trees should be issued to women farmers. NABARD should facilitate implementation of Agroforestry projects by private sector and rationalise the procedure for timely and adequate flow of credit to farmers specially smallholders, and livelihood financing should be extended to SHGs.

**Equity, Empowerment of Landless and Disadvantaged Groups through Cooperatives**

3.6.8.12 Improvement of degraded lands, poverty alleviation, productive employment generation, fuel, timber and fodder production by the active participation of women, landless and disadvantaged sections of society was launched from 1986-87 by the Indian Farmers Fertilizers Cooperative (IFFCO). A subsidiary called Indian Farm Forestry Development Cooperative (IFFDC) was floated. Leased
wastelands of Revenue Department of Government of Madhya Pradesh, democratically elected village bodies (Panchayats) of Rajasthan and private lands in Uttar Pradesh were managed by the cooperatives. Even a landless or socially disadvantaged wage earner engaged for planting Agroforestry spares a part of his/her wage to buy shares. In this process he or she becomes a permanent stakeholder of Agroforestry which provides much needed or most effective social protection. Demands of human-being or livestock pressure during early phases of plantations is minimized by setting up other micro-enterprises. During 1995-2001, about 20,397 ha of wastelands was planted with multipurpose trees and 2.87 million person days employment was generated with 45% being women beneficiaries. A total of 107 Primary Farm Forestry Cooperative Societies with a membership of 21,753 and 518 Self Help Groups were registered. A revolving fund of Rs.4.58 million was circulated among 663 Self Help Groups. Availability of fodder and credit-promoted livestock rearing, conservation and amelioration of soil, water and biodiversity were encouraged. Similar institutions (National Tree Growers Cooperatives) floated by the National Dairy Development Board are also promising initiatives for raising equitable Agroforestry by communities. The membership is gender neutral and is pro-poor with more than 76% being landless. The programme is socially equitable since 88% members belong to socially disadvantaged groups of people. These experiences should be widely replicated and further strengthened by linking them with Bharat Nirman, National Horticulture Mission, the National Rural Employment Guarantee Programme and other such programmes.

Kyoto Protocol

3.6.8.13 This is an important agreement of the United Nations Convention on Climate Change for promoting trading in greenhouse emissions. Agroforestry systems planted on abundantly available wasted or degraded lands can sequester carbon and other emissions. Soil organic stocks have improved in most of the Agroforestry systems established in the recent past. However, benchmarking of Agroforestry based stocks prior to 1990 and inventorization as well as certification of additional sequestrations is called upon to get into trading in emissions. Trained and
highly motivated cadre of technicians should be organized to take advantage of this provision and also to register India’s leadership in capturing new global opportunities when climate change is already a reality.

**Promotion/Participation of Industry**

3.6.8.14 Demand of soft wood by paper mills, match, plywood, chips, packing cases and supports goods industry is on the rise. Most of the grass based pulp and paper mills are shifting to soft wood. Ban on felling in natural forest in many areas has been imposed by Hon’ble Supreme Court of India. Similarly, many pharmaceutical, drugs, natural medicinal and energy generating companies are interested in the promotion of Agroforestry. Poplar based Agroforestry in North India was promoted by WIMCO Company by making available new clones, healthy nursery plants, customized plantations and signing of buy back agreements. Nearly 200 poplar wood based industries emerged during the last two decades in the twin city of Jagadhari and Yamuna Nagar of Haryana State with an annual turn over of about Rs.1000 crores. Large amount of financial resources were mobilized by selling public shares with attractive returns by many plantation companies. Teak plantations were raised on degraded leased lands by some of them. However, unfortunately, land use was ultimately diverted for the construction of tourist resorts or motels by some of them whereas most of the other companies disappeared. Corporate sector was offered some financial grants by the Ministry of Rural Development for raising pulp and wood industry based raw material during the Ninth Plan (1997-2002), but the overall outcome was rather discouraging. Leasing and contracting of land, including wasteland, to the corporate sector must be done carefully. Instead, landless and near–landless farmers should be allotted surplus and waternads and organised in groups. The corporate sector could join these small farmers’ estates as their nucleus under a Nucleus-Estate contractual arrangement.

**Strengthen Extension and Public-Private Linkages**

3.6.8.15 The extension agencies should be supported by a strong research unit which would identify suitable species, prepare yield and volume tables, fix rotation,
and in a participatory mode establish demonstrations and collect useful data for the user farmers. Research and technology outcomes should be strengthened to a level so as to become a real motivating force. Agroforestry and Farm forestry extension is a specialized activity and needs a separate infrastructure and human resources with a systems bias. Training of agroforestors as well as of trainers should regularly be organised. Strategically-located KVKs and ATMAs of the Ministry of Agriculture and similar outfits of the Ministry of Environment and Forests, particularly the Indian Council of Forestry Research and Education and the counterpart State institutions and organisations should regularly organise the training programmes and also establish system-based demonstrations,

3.6.8.16 Some of the wood-based integrated pulp and paper mills such as WIMCO, ITC, are promoting Agroforestry plantations by supplying Eucalyptus, Casuarina, Leucaena, Poplar and Acacia hybrid seedlings for pulp wood production. These companies have opted to promote Agroforestry plantations on marginal lands by providing high quality seedlings, technical extension services and buy back guarantee at remunerative prices to farmers. Fast growing, high yielding and disease resistant Eucalyptus clones with 3 to 4 times higher productivity have been developed by ITC Bhadrachalam Paper Board Limited. They have also selected ten promising Casuarina clones. WIMCO has developed their own poplar clones. Keeping in view size and diversity of India, these are very small and limited initiatives which require replication and scaling up. In addition, farmer-friendly Contract Farming should also be promoted. The public sector should essentially be involved as a facilitator in providing regulatory and services supports to strengthen production – processing – marketing chains.

Financial Requirement

3.6.8.17 The working group of the Greening India Programme of the Planning Commission, 2001, had estimated that 28 million ha additional land could be brought under Agroforestry in a ten year period. This is doable, hence should be implemented. The financial requirement for the Greening Programme would be of the order of Rs
48,000 crore in 10 years. The annual requirement would be Rs 4,800 crore against the current availability of Rs 1,601 crore. Bharat Nirman, National Rural Employment Guarantee Programme (NREGP) and “Food for Work” scheme should meet most of the expenses for this task. Additional funds, if needed, could be met from the plan budgets of Central and State Governments under various schemes of afforestation/tree planting, desert development, drought-prone area development, watershed development, command area development, settlement of shifting cultivation, wasteland development, National Horticulture Mission and other schemes of rural development. Externally-aided projects should also be formulated for availing assistance from various sources.

3.6.8.18 Institutional finance should be mobilized through normal run schemes of NABARD but should reach the farmer as directly as possible. Industries should also be enthused to participate in the Greening Programme through transfer of technology, supply of quality planting material and a captive market for the growers. Institutional funding is very important in areas where a farmer-industry nexus is to be established. However, the experience in the last 10-15 years shows that the flow of institutional finance into forestry programmes has been minimal and this malady should be rectified. Grassroot institutions, Panchayats and Gram Sabhas must play leading role in mobilising village communities, District Consortia on Agroforestry, involving public private, farmer and nongovernmental organisations should be constituted to provide collective technological and management support and for ensuring appropriate utilisation of resources.

Synergy

3.6.8.19 In order to contribute to the gigantic task of Greening India and harnessing the power of trees in 10 years timeframe, it is proposed to set up an Agroforestry Authority of Indiaby synergising the efforts of concerned Ministries and Departments for effective implementation, alliance, cooperation, partnership, monitoring and evaluation of the programme. The Agroforestry Programme will ensure environmental, food and livelihood securities, alleviate poverty and mitigate the adverse impacts of pollution and health hazards. It will reduce regional disparity,
bring desirable peace, prosperity and happiness and ensure an optimistic future for generations to come.

Acknowledgement

National Commission on Farmers expresses its gratitude to Dr. P. S. Pathak, Former Director, National Centre for Agroforestry Research (NCAFR) Jhansi, for his substantial inputs. Grateful thanks are also due to Dr. J. S. Samra, DDG, NRM, ICAR and Dr. Dhyani, Director, NCAFR, Jhansi and Dr. V. Pal Singh, ICRAF, New Delhi, and Dr. K. D. Singh, Former Forestry Advisor, FAO, for their contributions.

CHAPTER 3.7

GUIDING PRINCIPLES UNDERLYING THE DRAFT NATIONAL POLICY FOR FARMERS

PRO-SMALL FARMER AGRICULTURAL RESEARCH AND TECHNOLOGY POLICY

3.7.1.0 The Agrarian Distress

3.7.1.1 The Green Revolution, ushered in the country in 1968, has been heralded as one of the two most important achievements in the post-Independence era (the second being the country emerging as the largest functional Democracy in the world). It has helped India almost triple its foodgrains production, mostly through yield increases, and halve the percentages of rural poverty and food insecurity between 1968 and 2000. The Revolution was triggered by the development and large-scale adoption of High Yielding Varieties (HYVs) of rice and wheat, based on technology packages comprising improved seeds, increased fertilizer-use and assured water supply (irrigation). The process was duly supported by the provisions of inputs, marketing linkages and remunerative prices – the three support pillars of success of the Green Revolution. Above all, the necessary political will and farmers’ enthusiasm and commitment were there in plenty.

3.7.1.2. Despite the Green Revolution and satisfactory overall National GDP annual growth rate of about 7 percent in recent years (now over 8 percent), the country is home to one-fourth of the World’s hungry and poor. Worst, the number of hungry had increased from 203 million in 1995-97 to 221 million in 2000-02. To put faces behind figures, nearly 15 percent of our children are “wasted” and over 60 percent of the pregnant women and lactating mothers are anemic. Inadequate purchasing power is the main cause of the hunger at household and individual levels. Over 400 million children, women and men belonging to families with small and
marginal holdings as well as landless labour families are in deep distress. India is far off the track in achieving most of the Millennium Development Goals.

3.7.1.3. The agricultural growth rate during the past five years has decelerated to about 1.5 percent from about 3 to 3.5 percent during the preceding 20 years, thus dropping below the population growth rate, for the first time during the past 40 years. Capital formation in agriculture at 1.3 percent of the GNP is also one of the lowest in recent decades, adversely affecting irrigation and rural infrastructure development, whereas agriculture accounts for about 20 percent of the national GDP and 60 percent of the employment. Unemployment has increased to 9.1 percent, thus we have many more mouths to feed than hands working. The rural-urban divide (the Bharat-India divide) and regional imbalances have further widened and threaten national integration. The per capita income disparity between the farm and non-farm sectors has more than doubled from 1:3 to 1:6 during the last 30 years, threatening the social fabric and peace in rural India, especially in the chronically depressed regions.

3.7.1.4. The average farm size is going down and nearly 80% of the farm families belong to the marginal and small farmer categories. Fortunately, the ownership of livestock is more egalitarian. Enhancing small farm productivity, and increasing small farm income through crop-livestock integrated production systems and multiple livelihood opportunities through agroprocessing and biomass utilization, are essential both to meet food production targets and for reducing hunger, poverty and rural unemployment.

3.7.1.5. Our farm and fisher families have often been subjected to the fury of nature in the form of drought, unseasonal and heavy rains and floods, and climate change. Institutional support to small farmers is weak. The same is true of post-harvest infrastructure. The spoilage losses can be as high as 30% in the case of vegetables and fruits. Institutions, which are supposed to help farmers, such as research, extension, credit and input supply agencies, are by and large not pro-poor and pro-women. Mechanisms for risk mitigation are poor or absent. Hardly 10% of farmers are covered by crop insurance. Farm families are also not covered by health insurance. There is no Agricultural-Risk Fund. Both risk mitigation and price stabilization are
receiving inadequate policy support. The cost of production is often higher than the minimum support price, due to ever-increasing prices of diesel and other inputs. The cost-risk-return structure of farming is becoming adverse, resulting in growing indebtedness in rural areas and number of suicides among farmers. No wonder, a recent NSSO survey revealed that nearly 40 percent of farmers would like to quit farming, if they have the option to do so. Unfortunately, there is little option for them except moving into urban slums.

3.7.1.6. Technology fatigue in agricultural development is being felt widely. The total factor productivity growth rate particularly in the main Green Revolution belts of rice-wheat or rice-rice systems has decelerated. The huge foodgrain buffer stock (about 60 million tonnes) built a few years ago has almost disappeared and the government has decided to import about 2 million tonnes of wheat to rebuild the stock to the minimum desired level. This may push up international prices of wheat and of other foodgrains, and, if domestic prices and public foodgrain distribution system are not regulated and controlled, the price hike may benefit traders/hoarders and access to food on part of the poor may further deteriorate.

3.7.1.7. Green Revolution technologies are scale neutral but not resource neutral, since inputs are needed for output. Hence they have generally bypassed the vast rainfed areas and resource-poor farmers. A large number of crops and cropping systems were not touched by the Green Revolution process. The faulty use of inputs in Green Revolution areas has not only reduced the production efficiency, but also caused environmental and economic losses. For instance, the excessive drawl of underground water for irrigation has resulted in drastic drop of water table and uncontrolled flooding of fields uncoupled with drainage has caused serious waterlogging and salinity problems. Likewise, unbalanced use of fertilizers has adversely impacted soil health and lowered fertilizer productivity.

3.7.1.8. The problem of technological fatigue is further compounded with huge technology transfer gaps at various levels. Average national yields of most agricultural commodities in India are about 40 to 50 percent of the corresponding World averages. The gaps between potential and realizable and between realizable
and average realized yields in the country are generally around 50 to 100 percent, respectively. The existing exploitable yield gaps should be seen as an opportunity for future growth that is consistent with agro-ecological, environmental, socio-economic, political and technological settings in the major production regimes. With newly-improved methodologies for systems analysis, and greater access to relevant data, reliable estimates of potential yields in specific agro-ecological regimes are increasingly available. Such estimates will assist in estimating more reliably the gaps between actual and potential yields, and will assist also in charting strategies to bridge yield gaps through mutually reinforcing packages of technology, services and public policies.

3.7.2.0 New Challenges and Opportunities

3.7.2.1. Our Prime Minister has rightly emphasized the need to double annual foodgrain production from the present about 210 million tonnes to 420 million tonnes within the next 10 years. Since land is a shrinking resource for agriculture, the pathway for achieving these goals has to be higher productivity per units of arable land and water. Factor productivity will have to be doubled, if the cost of production is to be reasonable and the prices of our farm products are to be globally competitive. On an average, rice and wheat yields will need to be enhanced by about 40 percent and pulses, oilseeds, maize, millets, sorghum and horticultural commodities yields by about 50 to 100 percent (Figure 1).

![Figure 1. Required improvement in the productivity over the year 1994-95](image)

3.7.2.2. Gene revolution and ICT revolution are sweeping the world, especially the fast expanding knowledge-rich and knowledge-based economies. The first Green Revolution has failed to connect itself with these revolutions. The powers of biotechnology and ICT have not been internalised in India’s agricultural transformation process, although there are some “islands” of successes, viz Bt cotton hybrids and e-chaupal and sporadic Village Knowledge Centres. The national biotechnology policy is still in the making while area under “illegal” biotech varieties (Bt cotton hybrids) has been expanding fast (alongwith “legal” varieties). On the other hand, the conventional extension system has almost collapsed and there is limited involvement of the private sector in technology generation and transfer, other than that in hybrid varieties.

3.7.2.3. The high priority to achieve the MDGs notwithstanding, opening up of the economy and integration in global market implies dismantling of protective restrictions intended to safeguard national interests, and enhancing our competitiveness. Food self-sufficiency, maintaining low food prices, raising agricultural exports, and investments for upgrading production potential in a cost-effective and sustainable mode are overriding concerns. These have generated a stream of protective and incentive instruments (all bunched in AMS) which need adjustments under the liberalized regime and imply massive restructuring of the price structure. Agriculture is responding to these forces as well as to changing IPR regimes.

3.7.2.4. In the post-WTO era, both export and import of India have increased substantially. However, the increase in imports was relatively higher than that in export, thus bringing down the proportion of surplus to GDP from 3.2 percent in triennium ending (TE) 1995 to 2.7 percent in TE 2004, although there was a hump in the initial post-WTO years. This trend has adversely affected our self-reliance in agriculture. The value of export required to financing imports increased from 32 percent in the pre-WTO era to 57 percent in the post-WTO era. Huge imports of
vegetable oils and of pulses have depressed domestic prices of these commodities and adversely impacted their domestic production and producers’ income.

3.7.2.5. Agricultural growth in recent years has thrown new sectors and regions into prominence. Livestock, fisheries, horticulture, specialty enterprises (spices, medicinal, aromatic, organic) and value-added products illustrate this trend. Market-driven diversification in a global perspective has become the new paradigm driving future agricultural growth. The most profound shift pertains to rapid privatization in all domains - production, consumption, investment, technology, etc. and concomitant decline in State control. Alternative instruments and approaches are evolving to transform agriculture and a very important part of this ‘learning’ phase is a redefinition of the role of the State. Public goods, welfare imperatives, other regulatory needs, and other areas of market failure will continue to need government intervention. A matter of concern globally is shrinking investment in international public goods.

3.7.2.6. Rising capital intensity, particularly in the high-growth sectors of agriculture, has set in motion a new set of forces leading to biased knowledge, technological and market developments and thus exacerbating the problems of poor and small farmers. Declining growth in public investments and eroding institutional infrastructure are other disturbing features of the current trend. World agriculture, particularly trade, places high premium on quality, and public health, food safety and overall agricultural biosecurity concerns have become central themes of global regulatory negotiations. Equally important issues are sustainability of natural resources (particularly land, water and biodiversity) and other environmental externalities including global warming and climate change.

3.7.3.0 The Premise and Needed Paradigm Shifts to Strengthen Technology-led Revitalization of Indian Agriculture

3.7.3.1. Technology is the engine of growth and transformation and must address the above issues and opportunities. In consort with traditional and conventional technologies, cutting edge technologies, such as biotechnologies, ICT, space and
satellite technologies, GIS for land use planning and weather forecasting, etc., should be synergised and channelised to meet the human needs and aspiration with due consideration of equity and food, health and environment safety and ethical aspects. National agricultural research and technology policy and actions should ensure that science and technology, as prime mover of change, must specifically address the needs and prospects of majority small and resource-poor farmers and landless agricultural labour families, and help mainstream the gender concerns. Institutional, human capital and policy supports must capture the positive effects and minimize the negative effects of globalization and liberalization and of revolutions in biotechnology and information and communication technologies. Technology choice should thus be made according to agro-ecological and socio-economic conditions and market demand.

3.7.3.2 Not simply promises, but new science and technologies are already providing us new ways of tackling the difficult challenges. For example, the nutritionally improved rice, potato and cassava will greatly help in achieving nutritional security. Poor man’s crops, such as millets, cowpea, sorghum, chickpea and groundnut are receiving greater research attention. Biotechnologies jointly with Bioinformatics has already helped develop cereal varieties with greater tolerance to soil alkalinity and toxicity and which require less water.

3.7.3.3 Enhanced and sustained farmers’ income must be the main objective. To enhance the income, livelihood, nutrition and health security of farmers through mutually reinforcing packages of technology, techno-infrastructure, services, public policies, home and external trade and global competitiveness.

3.7.3.4 Based on a meaningful interaction between science and policy, relevant policies are needed to promote knowledge economies and to bring the much-needed congruence among productivity, sustainability, profitability and equity. The “Indian Enigma” of the co-existence of enormous technological capability and entrepreneurship on the one hand, and extensive under-nutrition, poverty and deprivation, on the other, must be resolved. Thus, it is not only biological and
physical sciences, but also humanities including economics and social sciences, which must all interact dynamically to yield wholesome results.

3.7.3.5. The following paradigm shifts are needed in technology generation and transfer mechanisms geared to revitalize Indian agriculture, and should be internalized in the national policy:

- The first paradigm shift relates to a shift in research approach from a single commodity based and monodisciplinary to a farming system based and multidisciplinary.
- The second shift demands a change from a top-down (training and visit system) extension approach to a participatory (effective research-extension-farmer-market-consumer interface) approach of technology generation, assessment, refinement and transfer.
- The third shift seeks the integration of molecular biology, bio-technology, bio-informatics, nanotechnology and other cutting-edge technologies with conventional as well as traditional technologies for speedy, more precise and wholesome gains.
- The fourth shift seeks greater congruence between productivity, sustainability and equity and creation of enabling mechanisms and inclusiveness for generation and adoption of new technologies. Cost-effectiveness of production, quality and safety in food and other products, and GMO biosafety and overall agricultural biosecurity, will assume high significance in the globalised and liberalized world.

3.7.4.0 Research and Technology Policy for Agricultural Renewal and Farmers’ Welfare

Towards an Ever-green Revolution

3.7.4.1. The future of our agriculture depends on our ability to increase productivity per units of arable land and irrigation water in perpetuity without associated ecological harm, a process known as “ever-green revolution”. Inaugurating the 93rd
Session of the Indian Science Congress on January 3, 2006, our Prime Minister, Hon’ble Dr. Manmohan Singh had observed that the technologies and the strategies unleashed by the first Green Revolution have run their course. He emphasised that we need a Second Green Revolution, particularly in non-food crops, in horticulture and in new plant varieties, and desired that as our agricultural growth plateaus, there is a need for a renewed thrust on research that can enhance farm productivity and sustainability, especially in rainfed areas. The Prime Minister reiterated that “we need greater emphasis on research that can increase the efficiency of utilization of inputs; that can improve farm management practices; that can reduce post harvest losses through better post-harvest management technologies in storage, transportation and processing; that can, in the final analysis, increase both yields and value addition at the farmer level leading to better incomes, especially of the small and marginal farmers.”

3.7.4.2. Both technology fatigue and technology gap should have no place in the Indian R&D system. In fact, at this juncture, technology should flow faster through the pipeline and more options should be available to users, and agricultural research, education and extension systems should be revitalised. Science and technology development towards an Ever-green Revolution must avoid the shortcomings of and build on the R&D foundation laid during the First Green Revolution. It must concurrently address the following four interrelated groups of technology generation and development priorities and approaches.

- Protecting yield and productivity gains, extending the gains to new areas, and enhancing yield ceilings and achieving new gains; bridging yield gaps; minimizing post-harvest losses, augmenting value addition and improving productivity and farmers’ income; and promoting eco-technologies rooted in the principles of ecology, economics, equity and employment.
- Exploiting the gene revolution (biotechnology); benefiting from information and communication technology revolution, space, nuclear and
nanotechnologies; and promoting knowledge-based precision farming systems, intensification and diversification.

- Protecting and improving natural resources (land, water and biodiversity); addressing environmental concerns, ecological security, agricultural biosecurity and sustainability; and managing climate change and natural disasters.

- Seeking congruence of productivity, profitability, sustainability and equity; addressing gender issues and problems of the poor and the excluded, particularly of small and marginal farmers and land-less agricultural labourers; and managing liberalized trade in the globalized world by addressing issues related to global competitiveness in the context of the WTO/AoA.

3.7.4.3. In particular, the Ever-green Revolution must be inclusive, pro-poor and address the concerns of rainfed and other non-congenial agro-ecological regimes. It must benefit from the latest developments in biotechnology, ICT, and other cutting edge technologies and synergistically link these technologies with conventional and traditional technologies and knowledge. Among other things, the challenges and opportunities arising from globalization and liberalization and the prospects of prevention of post-harvest losses, processing and value addition should be addressed under the Ever-green Revolution.

3.7.4.4. Thus, policy provisions must humanize technologies, and should emphasize:

- Enhancing capabilities for sustainable livelihood, and providing for new livelihood opportunities for the poor,

- Improving the productivity, profitability and sustainability of communities' assets, and establishing effective linkages between community mobilization and the government and other service providers,

- Ensuring the congruence and synergism among environmental, economic and social (gender and other equities) securities, and
• Empowering communities, especially the vulnerable ones, to harness new and appropriate technologies and enabling them to blend traditional local technologies with modern technologies.

3.7.4.5 With the above backdrop, the researchers and technology developers thus must ask themselves the following questions in deciding their research and technology development priorities:

• Will the technology lead to higher productivity across all farms, water regimes (rainfed drylands), soil types and regions, not just large farmers and well-endowed ones?
• How will the technology affect the seasonal and annual stability of production, especially the highly risk prone rainfed areas suffering from high instability?
• How will the technology affect the energy balance, eco-system and the sustainability of farming?
• Who will be the winners and losers from the technology – and how will it affect the majority small and marginal farmers, the poor and deprived ones?

Defending the Yield/Productivity Gains, Extending the Gains and Elevating the Gains: Strengthening Strategic, Anticipatory and Cutting-edge Research

3.7.4.6 A three-pronged iterative and synergistic approach of research and technology development is needed to defend the gains made in the past, to extend/expand the gains to new areas and to elevate the gains to newer heights (breaking yield barriers and achieving higher productivity and farmers’ income).

3.7.4.7 As regards protecting the yield gains, under certain production regimes there are signs of decline in actual yields, which must be arrested. A long-term strategy and a site-specific and knowledge-intensive integrated management of diseases and pests and soil-fertility management and integrated fertilizer use orientation are needed for technology transfer, adoption and monitoring by extension advisory systems and the farmers themselves. Soil-test based balanced fertilizer
application, particularly micro nutrients, real-time nitrogen management by leaf chlorophyll meter or leaf colour chart and soil nutrient budgeting, will be the elements of precision agriculture to sustain high yields and lessen the inputs-related deceleration of partial factor productivity.

3.7.4.8. Anticipatory research, risk assessment and management viz. management of Avian Flu strain H5N1 and prevention of the devastating wheat stem rust strain Ug99 from its entry and establishment in India, coping with climate change and natural disasters, contingency production systems should receive due priority and support. This approach calls for a paradigm shift in the technology transfer approach, based on intensive knowledge and higher capacity of extension agents of both public and private sectors. A District Technology Consortium approach involving scientists, grassroot institutions, corporate sector, NGOs, financial institutions and farmers is urgently needed.

3.7.4.9. Regarding extending the gains to newer areas, research and technology development for non-congenial agro-ecological and socio-economic settings, such as rainfed areas, especially arid drylands, hill and mountain agro-ecological zones, coastal lands and degraded lands should receive much greater priority and support than in the past. It is encouraging that yields of major crops have continued to increase during the past 35 years; they are projected to increase towards 2030, albeit at a decelerating rate, but nonetheless implying the continued need for developing the technologies wherewith to achieve increased yields. For instance, rice, central to the nation’s food security must maintain annual yield growth of about 2 percent towards the year 2020 to meet the demand. As cropping intensity becomes increasingly important, the features of crop duration and high per day productivity become preferred attributes. This calls for focused research and technology development for increasing input and natural resource use efficiency. The proposed National Rainfed Area Authority, describe later, should play a crucial role in promoting participatory research and technology transfer in rainfed areas.
3.7.4.10 As regards breaking yield ceilings, conventional breeding and management practices continue to offer great prospects of developing new super ideotypes, hybrids, and new life forms characterized by greatly enhanced new levels of yield, productivity, and adaptability, such as the Super New Plant Type, Super Hybrid, aerobic and NERICA rices and extra-long-spike, and hybrid wheat cultivars. These will be complemented by various genetically engineered products. Quality, consumer preferences, cost effectiveness, and environmental aspects of production, distribution and consumption of these new types will need to be critically analysed in order to assess efficiency and efficacy of their large scale popularization in the broader context of food security, poverty alleviation, sustainability, equity and agricultural biosecurity. Agro-processing, value addition, efficient marketing and trade and dynamic diversification (including niche production and organic farming) should be judiciously emphasized to enhance productivity, efficiency, competitiveness and income – a win-win situation for all.

**Enhanced and Sustained Productivity and Income**

3.7.4.11. The country may launch a national movement of technological revitalization of agriculture in this fast expanding knowledge society and the NARS comprising all ICAR institutions, Agricultural Universities and private sector institutes may commemorate 2006-07 as the Agricultural Technology Year to mark the 60th anniversary of our Independence. The major aim of this year should be to strengthen participatory research and knowledge management with farming families and the organization of about 60,000 Lab to Land programmes in the area of post-harvest technology and value addition to primary products to enhance farmers’ income through forward linkages, as highlighted in the Third Report of the NCF. There should be a proper match between production and post-harvest technologies and a post-harvest technology wing should be added to every Krishi Vigyan Kendra and KVKs should be redesignated as Krishi Vigyan and Udyog Kendras (KVUKs). Farm Schools should be established in the fields of farmer-achievers in order to foster farmer to farmer learning of new technologies. Value addition to biomass such as through establishing Rice Bio Parks and producing eco-boards from cotton stalks,
will help generate skilled jobs and additional income. Organic Farming and Low External Input Sustainable Agriculture (LEISA) techniques should be promoted along with Integrated Natural Resource Management and Integrated Pest Management (IPM) techniques, and all programmes designed to foster access to technologies must be gender sensitive.

3.7.4.12 Agricultural scientists should state the performance of new varieties and technologies in terms of net income per hectare, and not just in terms of yield per hectare. The aim of technological transformation of farming systems should be to enhance income per hectare on an environmentally sustainable basis. For landless agricultural labour and other unemployed rural youth, the aim should be to convert them into skilled workers, thereby adding economic value to their time and labour. The training should be in skills which can help in organizing market-driven enterprises. The Bharat Nirman and National Rural Employment Guarantee Programme of the GOI should help foster job-led economic growth in villages and bring about a shift from unskilled to skilled work based on new technologies, and stop job-less and job-loss growth.

3.7.4.13. The economic viability of farming depends heavily on assured markets and remunerative prices. The production-processing-marketing-consumption continuum should be rendered farmer-centric and each link in the chain should receive timely and adequate research and technological attention and should be synergized with each other. In this context, Land Use Boards both at Central and State level could play a vital role, but have not done much in the past and need to be suitably restructured, strengthened and activated. There is an urgent need for a National Land Use Advisory Service, linked to State and Block Level Land Use Advisory Services on a hub and spokes model. These can be virtual organizations with the capacity to link land use decisions, especially diversification of farming systems, with ecological, meteorological and particularly marketing factors on a location and season specific basis. The National Land Use Advisory Service can be linked to the proposed Indian Trade Organisation (ITO) as elaborated in the Third Report of the NCF. It should have continuous contact with all credible national and international sources of
information on relevant technologies and resources in all subsectors of agriculture and on domestic and international markets. Without economically, technologically and ecologically sound and proactive advice on land and water use, farmers will have to fend for themselves in taking decisions on what to grow, where to sell and at what price, which may often prove unfriendly.

3.7.4.14. The ‘contract farming’ model of agribusiness is gaining momentum. However, usually devoid of formal contract between the farmers and the prospective buyers, the arrangements could be biased in favour of the agribusiness organization. But, there are beneficial effects of such arrangements to the farmers in the matter of access to adequate/timely credit, good quality inputs, new technology, employment generation, introduction to new crops, separation of production and marketing risks and better farm practices etc. The need is to develop a comprehensive, clean, equitable and farmer-centric model agreement, which cannot be abused against the farmers. Special care needs to be taken regarding clauses dealing with quality standards, withdrawal conditions, pricing standards, paying arrangements, acts of God clauses and arbitration mechanism. Till such a code of conduct is introduced and the farmers are empowered by formation of groups/cooperatives to deal with the agribusiness unit on their behalf, one has to be rather cautious about these arrangements.

3.7.4.15. In a globalised economy, we should develop appropriate institutional instruments and policies to safeguard the livelihood security of nearly 70% of our population who depend on crop and animal husbandry, inland and marine fisheries, forestry and agro-forestry and agro-processing for their work and income security. Risk Mitigation and Price Stabilization Funds will be needed. All Technology Missions and the Small Farmers’ Agri-business Consortium (SFAC) should be restructured and suitably funded under competent professional management. As highlighted in earlier NCF Reports, each Mission should have measurable time-bound goals and should not only be subsidy-rich and primarily concerned with subsidy distribution, but should concentrate on technology-led agricultural transformation.
The Mission Director, an eminent professional, should be in position at least for a period of five years.

**Natural Resources Management**

3.7.4.16. India’s Agricultural Renewal heavily depends on the restoration and enhancement of the health of our soils, water and genetic resources, which have unfortunately been degenerating fast under various pressures. Appropriate crop-livestock-fish-tree integrated farming system should be pursued for sustaining and enhancing the natural resources.

3.7.4.17. **Soil Health**: Establish a National Network of Advanced Soil Testing Laboratories. The existing laboratories should be retooled and reequipped and the staff retrained in order to enable them to provide each farm family with a Soil Health Card, which contains integrated information on the physics, chemistry and microbiology of the soils. The Soil Health Cards should stimulate balanced fertilization, including the amelioration of micro-nutrient deficiencies. In order to improve organic (carbon) balance of soils, through campaigns and demonstrations, the introduction of fodder/grain legumes in the crop rotations as also green manuring as well as composting of all agricultural residues and wastes and the use of microbial fertilizers and farmyard manure should be promoted to the maximum extent possible.

3.7.4.18. Methods of soil health enhancement through integrated nutrient supply will have to be prescribed and farmers should be assisted to adopt the recommendations. A dedicated cadre of soil technicians/scientists for the National Movement on Soil Health Care with defined targets and resources (functioning equipment and trained human resources at the soil testing laboratories) should be created. Community Land Care movements may be launched by Panchayats. Needless to assert, soil health enhancement and removal of their hunger and thirst especially in rainfed dryland areas hold the key to improving the return from investment in other inputs like seeds and water.
3.7.4.19. Breeding soils for higher productivity may be undertaken in the case of problem soils and wastelands. Wasteland development could be linked to the production of biofuel and industrial raw material (for the production of paper and board, rayon, packaging material etc) as well as fodder, firewood etc. People must be made aware and sensitised of the shrinking capacity of soils to absorb any more abuse. A National Soil Charter structured on the “World Soil Charter of FAO” and “UN Soils Convention” should be created to ensure soil health security.

3.7.4.20. **Water:** Jal Swaraj or self-sufficiency in irrigation water availability is the need of the hour. Water is a public good and a social resource and not private property. The privatization of water supply distribution is fraught with dangers and could lead to water wars in local communities. Increasing supply through rainwater harvesting, recharge of the aquifer and water conservation should become mandatory. In addition, a nationally debated and accepted strategy for bringing 10 million hectares of new area under irrigation under the Bharat Nirman programme should be developed. All existing wells and ponds should be renovated. Demand management through improved irrigation practices, including sprinkler and drip irrigation, should receive priority attention. A water literacy movement should be launched and regulations should be developed for the sustainable use of ground water. Farmers need technical advice in site selection for borewells, particularly in the Southern Plateau Region. A farmer-friendly insurance cover for failed wells is also needed for ground water development. Seawater farming should be promoted in coastal areas through the cultivation of mangroves, salicornia, casuarinas and appropriate halophytic plants. The conjunctive use of rain, river, ground, sea, and treated sewage water should become the principal method for the effective use of available water resources.

3.7.4.21. In water scarce areas, the land use system should place emphasis on the cultivation of high value, low water requiring crops, such as pulses and oilseeds. Pulses and oilseed villages can be promoted where all farmers work together in harvesting rainwater and sharing the water equitably for growing pulses and oilseeds. Promotion of “Hybrid Arhar (pigeon pea) villages” can be the starting point of a
pulses revolution. In paddy and sugarcane, water saving methods of cultivation like those inherent in the “System of Rice Intensification” (SRI) methodology should be perfected and popularized. More crops per drop of water should not remain just a slogan. Land use decisions are also water use decisions. Hence, the choice of cropping systems should be based on irrigation water availability including rainfall pattern. Watershed management should be linked to the different Technology Missions as emphasized in our earlier reports, so that the concurrent availability of water and of the other inputs like seeds needed to optimize the benefit from irrigation water can be ensured. Low cost green houses can be promoted in areas where evaporation exceeds precipitation during many months in a year. Panchayats may be assisted in launching water literacy and water quality management programmes and in promoting participatory irrigation and efficient water use management. Extra efforts are called for minimizing water pollution due to pesticides, other agrochemicals and toxic substances.

3.7.4.22. Both the anthropogenic and natural causes of occurrence of poor quality water are known and their piece-meal solutions are also known. Looking into vast areas under such problems and their adverse impact on agricultural production, an ‘Integrated Water Use and Management System’ is to be developed to address the problem in a sustainable and holistic manner. Biodrainages should be promoted towards reclamation of saline, waterlogged and other wastelands. Along with irrigation, drainage development should also be considered an integral part of national water use policy.

3.7.4.23. A National Research Centre on Glacierology should be established for collection, storage and dissemination of information on status of seasonal/perennial snow and ice. The Centre should undertake research on understanding the interaction amongst biological processes, physical environment and the climate change and develop early, medium and long-term warning systems and advise on trends of water availability and overall hydrological situation in the medium and long-term.
3.7.4.24. **Biodiversity**: Biodiversity, comprising genetic resources, is the building block of functions and forms of living organisms and will always be needed to produce new genotypes to meet the ever changing needs of humankind. New sciences of biotechnology and bioinformatics, coupled with conventional sciences, should be judiciously used for developing efficient and effective methods of conservation, utilization and exchange of genetic resources. Due to economic and population pressures the resources are eroding fast. Moreover, their availability is getting increasingly restricted due to their propriety protection under several systems. The Cartagena protocol for conservation, biosafety and sharing of genetic resources provides largely accepted and harmonized current practices and standards, and should be accepted by all countries. Along with Plant Breeders Rights, Farmers' Rights should be honoured and implemented for equitable and fair sharing of benefits arising from the use of genetic resources. In this context, the indigenous rights over genetic knowledge and women's sphere of plant knowledge as well as the Farmers’ Plant Back Rights should be recognised under any intellectual property rights regime. The PVPFR Authority should ensure strengthening of national biodiversity management capacity, implementation of the Farmers’ Rights, execution of the TRIPS and SPS commitments, and judicious use of the Natural Gene Fund and the National Biodiversity Fund.

**Pro-Small Farmer and Pro-Poor Technologies for Inclusive Development and Economic Security**

3.7.4.25. Science and technology must promote inclusive development by addressing the needs and opportunities of small farmers, poor, less-favoured areas, neglected and excluded communities. Even biotechnology can be geared towards this cause. Benefits and risks associated with new technologies should be studied carefully before they are recommended to resource poor farming families.

As repeatedly emphasized by Nobel Laureate Amartya Sen, the lack of entitlement to basic resources is the main cause of hunger and poverty. Scientifically informed agrarian reforms to grant titles to land and water, and increased access to credit, knowledge and markets, will enhance productivity, sustainability (through better land
and water care) and income, thereby resulting in appreciable reductions in hunger and poverty. Engendering these changes and technologies and socioeconomic safety nets designed for small-scale and marginal farmers are essential for supporting rural livelihoods, and this aspect should be explicitly highlighted in national policies.

3.7.4.26. As highlighted by the Prime Minister, agricultural research and technology development must address the challenges and opportunities of small farmers. In this context, we must differentiate between small farms and small farmers. The small could be beautiful if managed and supported suitably, otherwise both remain “small”. Farmers owning less than two hectare cultivated land are classified as small farmers and those owning less than one hectare are categorised as marginal. Generally, those owning around 2 hectare irrigated land, with an average family size of 5-6 persons, are able to achieve and sustain their livelihood solely from agriculture. But, marginal irrigated land farmers and those owning even around 2 hectare rainfed land are often hardpressed to secure their livelihood solely from agriculture, as their income is generally small and inadequate to access desired inputs, technologies and markets, resulting in perpetual low agricultural productivity and depressed production. For such households, timely availability of adequate institutional credit at reasonable rates or even 30 per cent supplementary off-farm or non-farm income are essential to access the necessary inputs, technologies and markets to keep them out of the poverty trap and to render them efficient producers.

3.7.4.27. Studies reveal that, other things being equal, primarily because of the full indulgence and commitment of the family labour, small and marginal farms, as compared to large and medium-large farms, are more efficient and have higher productivity, cropping intensity and diversification index. Further, as discussed later, if organized in groups (Small Farmer Estates, Cooperatives, SHGs or Farmers’ Clubs), with desired economies of scale and with effective backward-forward linkages, small and marginal farms would generally be viable and effectively contribute to the national production, productivity and sustainability. But, the same size small farms, if owned by resource-poor small farmers with little access to formal credit, insurance, irrigation, technology and market, become non-viable and suppress
household as well as national productivity, income and livelihood security.

3.7.4.28. Recognising that alternate employment opportunities are limited and the number of small, marginal and sub-marginal farmers constitute nearly 80 percent of the rural households, and their number continues to grow, increasing productivity of such farms, predominantly comprising crop-livestock integrated systems, should be a priority goal of the Central and State Governments. Multiple livelihood opportunities should be promoted through strengthening production-agroprocessing-biomass utilisation-marketing chains. The National Agricultural Research System (NARS), encompassing public, university and private sectors, should topically and judiciously align their research and technology development priorities and programmes with the farmer’s capacity, need and aspiration by promoting participatory research.

3.7.4.29 The ownership of livestock is much more egalitarian since resource poor farming families own a majority of cattle, buffalo, sheep and goats. Livestock and livelihoods are very intimately related in our country and crop-livestock integrated farming is the pathway for farmers’ well-being. The major constraints experienced by such families relate to fodder, feed and healthcare. There is an urgent need for establishing Livestock Feed and Fodder Corporation to assist SHGs to produce good quality animal food locally, by providing seeds and planting material of improved varieties. The role of fisheries should also be strengthened and integrated. Particular attention should be paid to help SHGs of fisher families in producing seed and feed for aquaculture. The market value of Indian fishes should be enhanced by promoting special organic fish products and air-breathing fishes as health foods and promoting utilisation of underutilised species.

3.7.4.30. Alienation of small and marginal farmers from commercial banking and fair marketing systems is their major handicap in harnessing new technologies. It is encouraging that the 2006-07 Budget has reduced the rate of interest for crop loans to 7 percent. However, keeping in view the decline in the profitability of agriculture, increasing farmers’ distress and indebtedness, the Government may consider providing support to the banking system for further reducing the interest rate to 4
percent and minimise the hassles and redtape in procuring loan. The small farmers in
distress hotspots should not be charged compound interest on arrears. Micro-
financing should be changed to “livelihood” financing to further enhance the access
of the poor to various services. A long-term policy on agricultural credit needs to be
developed to include wider coverage, including consumption and entrepreneurial
needs of farmers. The Central and State Governments should jointly create an
Agriculture-Risk Fund to provide relief to the farmers in case of successive droughts
and other calamities. Special efforts are needed to issue Kisan Credit Cards to the
unreached and needy farmers, especially women farmers. Small and marginal
farmers should also be saved from distress sale by pledging loans to them against
their warehouse receipts.

3.7.4.31. Small farm productivity should be enhanced not only for increasing food
and nutritional security of majority small farmers, but also for generating marketable
surpluses which must be disposed off timely and remuneratively to enhance farmers’
income. MSPs for the commonly produced commodities should be appropriately
fixed (based on C₃ cost) and timely announcement (of the MSP), procurement and
payment should be ensured. Enhanced income of the farmer will lead to increased per
capita consumption and enhanced domestic demand for a larger and diversified food
basket and consumer goods at household levels, stimulating overall economic growth.
Further, urbanization and globalization have fuelled dietary convergence and dietary
adaptation. These present both an opportunity to reach lucrative new markets and a
substantial risk of increased marginalization of smallholders and poor people leading
to even deeper poverty. In order to capitalise the opportunity, smallholders must
organize themselves in cooperatives or as Small Farmers’ Estates or SHGs to
undertake group farming and contract farming to enhance their economies of scale
and competitiveness and should be guided by well-researched and structured
diversification and intensification, and supported both by the public and private
sectors for training and skill development and start-up funds.

**Mainstreaming the Smallholder in High-value Agriculture**
3.7.4.32. Involvement of smallholders in high value agriculture is crucial for achieving inclusive and equitable development. The role of the corporate system in the overall food chain is becoming important, highlighting the need for greater and effective linkages between public and private sectors in the changing food situation of the country. This linkage must be addressed by the country’s innovation and research system. Indian supermarkets are increasingly retailing and distributing not only processed food but also fresh vegetables and fruits and other agricultural products and are playing an important role in the food chain. This has also put an increased pressure on food management and processing. In this transformed scenario, we must not forget the role of small and marginal farmers who are not only producers but also constitute the bulk of the poor consumers as customers. Small farmers thus must get a foothold in this changing food chain. The hub and spokes model of the Nucleus Estate-System to provide centralised services to support decentralised production should be promoted. Agri-clinics, agri-business centres and SFAC could play an important role in this direction.

3.7.4.33. In order to mainstream the small landholders into the high-value agricultural and supply chain, the strategic partnership between public and private sectors will be needed. Such an arrangement should be built to pool risk and resources to bring actors together to resolve market failures. Supply chain plays important role in cooperation of the partners to specify high quality products to generate value and consumer demand. Such a win-win situation is particularly favourable for smallholders in terms of higher prices, knowledge, reduced losses and assured markets. However, smallholders are not able to make these demands due to market failures attributed to information asymmetries, organisational failure, high transaction cost and regulatory failures. The synergy of the public-private partnerships, especially involving the smallholder is bound to create mutual benefits and confidence and can remedy market failures which cannot be undertaken separately by public and private sectors.

3.7.4.34. The market failures can be remedied through: creation of research contribution to deliver high quality varieties, particularly suitable for processing,
development of third party certification organization and public-private-partnership-led initiative to create producers’ organisation to improve marketing and build linkages with processors, as suggested in the NCF Reports in relation to the creation of Small Farmers Estates (SFEs) on the NDDB model. The PPPs must be at the chain-level to intervene in all major bottlenecks, as targeting one may not benefit the whole supply chain. Bulk vending should be promoted to cut cost and also to mainstream small producers in market chain. Establishment of effectively functioning rural warehouses and transport connectivity and facilities, especially in hills and mountains and dryland arid zones, will be essential for linking the smallholder with the market chain. The PPPs must also induce positive effects for all stakeholders, processors, retailers, etc. to ensure a positive feedback and benefit to the whole supply chain. For keeping the system dynamically responsive to new situations with optimum output for all the partners, it may be prudent to undertake research to identify appropriate partners and modalities to scale-up PPPs and as to how can PPPs regulate market failures.

**Value Addition and Prevention of Post Harvest Losses**

3.7.4.35. Post harvest losses, on an average ranging from 10 to 30 percent depending on commodities, being high in horticulture, livestock and fisheries - all high value products, are colossal, estimated about Rs. 50,000 Crore each year. For instance, in horticulture, serious mismatch between production and consumption continues although there is no reliable data available to estimate the success achieved during the last 10 years in reducing post harvest losses. The estimates of monetary losses being incurred in the country keep rising. The huge investments made not only by the Department of Agriculture and Cooperation, but also by the APEDA, NCDC, NAFED, Ministry of Food Processing etc. have thus not succeeded much in reducing the staggering post harvest losses. No authentic data are available on the reduction in losses, if any, achieved due to the infrastructure created, improved PHM technologies promoted and several policy initiatives taken for streamlining the systems involved. This data gap is a serious hurdle in setting research and technology acquisition priorities, and should be abridged soon.
3.7.4.36. The extension staff, private sector and PRIs can play an important role in educating the farmers in better post harvest management practices. There is a need for introducing a Post Harvest Technology Wing in every Krishi Vigyan Kendra and organize processing and value addition demonstrations throughout the country, as mentioned earlier. Many of the demonstrations should be organized in dry farming areas, where millets, pulses, oilseeds and cotton are grown. The help of the Central Food Technology Research Institute (CFTRI), Mysore should be taken by ICAR while designing the Lab to Land programme. The demonstrations should be so designed that they also serve as training grounds.

3.7.4.37. Further, liberalization has brought focus on technology as a major factor in competitive marketing, which should be duly reflected in new agriculture and science and technology policies. As trade shifts from primary products towards processed and manufactured products, greater emphasis will be needed for agroprocessing and post-harvest technologies that convert primary products into quality products and value-added products. Horizontal and vertical diversification can together proceed to expand options for quality products that meet fast-changing demands of local and foreign markets. Trade - , biosafety - , gene - and legal-literacy should be ensured at all levels, from farmers to policy-makers. These moves will promote farmer-industry linkage, small and medium enterprises (SMEs), rural entrepreneurship, and off-farm rural employment. It will be necessary to generate and transfer low-cost post harvest and agroprocessing technologies and to create marketing infrastructures that pay increased attention to food safety and to minimize post-harvest losses which are particularly large for horticultural, livestock, and fish products.

3.7.4.38. Institutional innovations will have to be explored, e.g. Contract Farming, Nucleus-Estate linkage systems, Small Holders’ Estates and Futures Markets. The group dynamics will promote decentralized mass production by masses and benefit from centralized services. Through ensuring backward-forward linkages under an end-to-end approach, the Small Holders’ Estates will synergise production-processing-marketing linkage. Commodity-based farmers’ organisations should be promoted to facilitate direct farmer-consumer linkage and direct sale by farmers. The
supply chain is long and the intermediaries add their margin with very little/no value addition, leading to increase in the price paid by the ultimate consumer and low share of the producer.

3.7.4.39. Specialty commodities, such as off-season varieties and production systems, new crops, and novel varieties and breeds should be identified to capture new opportunities. With the increasing demand for herbal medicines and botanicals, and for organically produced food, aquaculture and other products, several countries have developed specific production and distribution patterns. Public and private sector support in supplying quality seed, planting materials, processing, procurement and marketing to promote these initiatives is a condition *sine qua non*. Individual countries have developed or are developing policies, strategies and programmes on such diversifications. As several of these initiatives are innovative and diverse, there is good scope for sharing such experiences through information system networks as well as through Technical Cooperation among Developing Countries (TCDC) arrangements promoted by FAO and other UN agencies and international organisations.

**Greening the Grey Areas**

3.7.4.40. Rainfed and other less favoured areas have the highest concentration of poor and malnourished people; these highly risk prone areas are characterized by low agricultural productivity, high natural resource degradation, limited access to infrastructure and markets, and other socio-economic constraints. In the interests both of improving household food security and lessening socio-economic inequity, and also of raising national agricultural production, research and technology development must give greater attention to soil health, water conservation, livestock for livelihood security, horticulture and agroforestry in the rainfed areas, while maintaining and further increasing the gains made in irrigated areas. Genetic improvement for tolerance to water stresses (both scarce and excessive), salinity, acidity and other abiotic stresses as well as to biotic stresses, water harvesting and enhanced water and fertilizer use efficiency, management of soil erosion, crop-livestock-fish-tree integrated farming systems, participatory research, contingency farming and agro
forestry should be high priority research agendas in rainfed areas. Technology transfer systems, including input and institutional supports should emphasize precision and pace, hence the need for greater skill, alertness and commitment.

3.7.4.41. Yield and productivity gaps are particularly large in rainfed areas. This is attributed mainly to large variability of soil features, negligible control on water, weak technology assessment, refinement and diffusion mechanisms and poor institutional supports. Seed security for crop security is a must in rainfed areas. Therefore seed banks, gene banks, water banks, fodder banks and food banks are essential for achieving and maintaining livelihood security in such areas. There are several successful stories of bridging the gaps at various levels, which should be critically analysed for identifying the underlying drivers of change and their judicious scaling up and adoption for greening the grey areas. A recent IFPRI study had examined the prospects of replicating and sustaining sporadic and isolated instances of technology-triggered success stories of enhanced yields to achieve broad-based aggregate successful growth in rainfed agriculture and suggests that, “where there is participation and individual motivation, where incentives are aligned with improved means to respond to incentives, and where technology plays a pivotal role, success may follow”.

3.7.4.42. The Prime Minister in his address to the Nation on the 15th August, 2005 had emphasised special focus on removing the problems of farmers, many of whom are marginalised in dryland areas, and announced setting up a National Rainfed Area Authority for this purpose. Unlocking the rich and diversified production potential of these areas was an imperative at the present juncture of our agricultural development. The National Commission on Farmers and Planning Commission had jointly organised last month a high level meeting involving also Secretaries of the concerned Departments, development planners and NGOs on the structure and function of NRAA. It was agreed that the basic mandate of NRAA should be to help farm families to achieve income and work security by promoting a farming systems approach to foster water harvesting, conservation and sustainable and equitable use of
rainwater to provide livelihood security to rural communities and to ensure the security and productivity of crop and animal husbandry, forestry and fisheries.

3.7.4.43. The NRAA should be a highly professional body whose recommendations and action plans are characterized by high scientific content and economic credibility. Principles of ecology, economics, equity (gender and social) and employment generation should guide the work of NRAA. The NRAA should provide scientific and intellectual support to and fully tap the potential of Panchayati Raj Institutions and participation of NGOs and community-based organisations. The NRAA should be structured somewhat like National Dairy Development Board with clear-cut functions in the areas of policy formulation, resource mobilization, coordination with all concerned Ministries, Centre – State linkages as well as with Bharat Nirman, NREGS, etc. and issues related to sustainable water security in the rainfed areas and mitigating the impact of drought and strengthening the livelihood security systems. In view of the high priority to rainfed dryland agriculture, these recommendations should be duly internalised in the technology policy and acted upon.

Managing the Gene Revolution

3.7.4.44. The global area planted with biotech (GMO) crops has steadily increased during the last ten years. Today, approximately 8.5 million farmers in 21 countries are growing such crops covering about 90 million ha (Figure 2). India so far grows only one biotech product, i.e., Bt Cotton, occupying nearly 0.7 million ha under legally-released Bt hybrid varieties and an additional about 0.6 million ha under “illegal” Bt hybrid varieties. A recent study has revealed that, on an average, 30 percent of the illegal seeds are non-Bt, only 27 percent are F₁, rest of 43 percent are only 10-75 percent positive for Bt, indicating F₂ and mixtures. Fake cartons of the legal seeds are increasing. Such huge flows of spurious seeds, fraught with economic and ecological dangers and erosion of confidence of the farmers and the civil society in an otherwise productive and farmer-friendly technology, should be halted forthwith. Bt detection kits are available and should be used judiciously and transparently to confirm truthfulness of the seed and to build up quality control and faith in the technology and the seed chain. The research and regulatory and extension...
systems must be effectively aligned to ensure smooth and cost-effective flow of quality seed.

3.7.4.45. The Gene Revolution is primarily propelled by the private sector, which has important implications for the kind of research performed, types of technologies developed and the way the technologies are disseminated. It raises concerns that the small farmers may not benefit. The potential of biotechnology should be approached with a balanced perspective by integrating it within the national research technology and development framework and using it as an adjunct to and not as a substitute for conventional technologies in solving problems identified through national priority setting mechanisms. Priority setting should also take into account national development policies, private sector interests, market possibilities, potential for adoption by farmers, public perceptions of safety, and consumers' views. The technology should be developed by training a couple of women and men members of every Panchayat/local body in the management of new technologies, such as the establishment of *refugia* in Bt Cotton fields. A Scientist–Panchayat linkage is the need of the hour. Genome Clubs may be organized in village schools and KVKs to spread genetic literacy.

**Figure 2. Global Area of Biotech Crops**

3.7.4.46. A panel chaired by Prof. M.S. Swaminathan, June 2004, had prepared a National Biotechnology Policy document and suggested the establishment of an autonomous National Biotechnology Regulatory Authority to oversee and harmonise
biotechnological developments in fields of Agriculture and Food, Environment and Medicine and Pharmaceutics. The Department of Biotechnology has also been preparing a document on national policy on biotechnology through a widespread consultative process. The National Commission on Farmers considered these two initiatives and widened the scope of the consultative process by organising a consultation with farmers and farmers’ organisations. The NCF recommends that a National Policy on Biotechnology should soon be firmed up and announced. The policy must address the following issues:

- Value, usefulness and appropriateness of biotechnologies and enhanced gene literacy,
- Risk and biosafety aspects and their management,
- Equity and ethical dimensions, overall awareness and promotion of pro-poor features of biotechnologies,
- Control of and access to biotechnologies, the role of public and private sectors, harmonization of IPR, SPS and other regulatory provisions, and
- Investment in research and other institutional supports and partnerships for transparent and balanced harnessing of biotechnologies to address particularly the food insecurity, malnutrition, and poverty issues.

3.7.4.47. Appreciating the fundamental commonness of the genetic thread throughout the living organisms – microbe to man, the NCF recommends that an Agricultural Biotechnology Authority should be established soonest as a major component of the National Biotechnology Regulatory Authority. It should be steered by an Advisory Committee comprising scientists, representatives of public and private sectors, industry, CSOs, NGOs and farmers. The Authority should combine both regulatory and advisory responsibilities and coordinate and harmonise the various socio-economic and other development aspects, regulatory measures and bioethical and biosecurity norms towards harnessing biotechnologies for the good of the common man (aam adami).

Managing WTO/ AoA
3.7.4.48. Cost competitiveness and product quality issues are critical to compete in world market. Research and technology development should be geared and focused to increase the overall competitiveness of our major crops and commodities. This calls for enhanced and sustained efficiency of inputs use, thus cutting cost of production, improving quality and reducing post-harvest losses so that the input-output ratio is maximized (without sacrificing the ecological and environmental security). International quality and safety standards for agriculture products are very high. Meeting of their standards involves substantial costs for building technical and physical capability. There is a need for pooling talents and resources available in both public and private sectors to build this capacity. Finally, public research system should shoulder the responsibility to protect small farmers from ill-effects of trade reform process.

3.7.4.49. Along the production-processing-marketing chain, commodity-specific detailed action plan should be prepared with clearly defined goals. India’s preparedness in the field of SPS measures is highly inadequate. As a result of which, several of our consignments get regularly rejected. The situation is likely to get still worse in the coming years as Safety Standards and Guidelines developed by international bodies such as Codex Alimentarius, International Plant Protection Convention and the Convention on Biological Diversity (CBD) get more and more stringent, let alone the fast shifting of the goal posts. Thus, the urgency of the launching of quality and food literacy movement at all levels, from farmers to policy-makers, and strengthening of SPS infrastructures can hardly be overemphasized.

3.7.4.50. We must urgently augment and create survey, surveillance and quality literacy programmes. The SPS infrastructure should be brought at par with International Standards and awareness should be generated abroad on steps taken by India to maintain high standards regarding food safety and biosafety. Keeping in mind high prospects of enhancing livestock and poultry exports from India, the food and health safety concerns for livestock and poultry products will particularly be important since livestock economy is the backbone of a large number of marginal
farmers and landless agricultural labourers. But today large parts of livestock and poultry products international trades are restricted because of infectious diseases.

3.7.4.51. The Union Minister for Commerce and Industry and the Government of India have done a commendable job in safeguarding the interests of our farm women and men in the WTO negotiations. As a national self-empowerment measure, we should consider establishing an Indian Trade Organisation (ITO) and our own boxes for domestic agricultural support on the model of WTO’s Blue, Green and Amber Boxes, as suggested in the Third Report of the NCF. Only a small proportion (6.2 percent) of our agricultural commodities enters the global market, whereas with a population of over a billion, there is a large home market. Hence, we must segregate the very modest support we extend to our farmers into two groups - those which are of the nature of life and livelihood saving support to small farm families, and those which could be considered as trade distorting in the global market. The Indian Trade Organisation (ITO) can be a virtual organisation, specializing in WTO affairs. It can serve as a brain and information bank for enabling Government to take informed and proactive decisions and should particularly serve as a friend and guide to small farm families in consultation with Land Use Board and should provide proactive advice on land use and crop planning. It should help to save resource poor farm families from the onslaught of the subsidy, technology and capital driven agri-business paradigm of OECD countries, and buttress our debt-ridden farmers against various trade distortions.

Access to Modern Technology and Information for Progressive Farming

3.7.4.52. The huge technology awareness and transfer gaps may be ascribed to: (i) the nonattractiveness of the technology package, (ii) farmers unawareness of the efficacy and power of new technologies, (iii) nonavailability of quality inputs at right time, in right quantity and at right and affordable cost, and (iv) the deteriorating term of trade for agriculture as reflected in the stagnating and declining farmers’ income and the rising (often strangulating) indebtedness of the farming households. The main pillars of the Green Revolution have also weakened – decelerated genetic gains and deteriorating flow of quality seed, quantitatively stagnating but increased imbalanced
use of mineral fertilizer, decelerated irrigation growth and highly inefficient use of water, and “opportunistic” political will and dwindling investment in agriculture and in livelihood of farmers. A simultaneous and effective removal of these weaknesses is the *sine qua non* for revitalization of Indian agriculture.

3.7.4.53. The National Sample Survey Organisation (NSSO), Ministry of Statistics and Programme Implementation, in its second of the five reports entitled, “Situation Assessment Survey of Indian Farmers: Access to Modern Technologies for Farming,” June 2005, had analysed the extent to which the farmers access various sources for getting information on improved farming techniques and the extent to which they use such information (Box I). The survey report shows that only 40 per cent of farmers in the country accessed one or the other source for getting information related to modern farming. While in Andhra Pradesh and West Bengal over 60 per cent of the farmers contacted some source for farm related information only 15 per cent did so in Rajasthan. The most frequently accessed source was ‘other progressive farmers’ (17%) followed by the ‘dealer providing inputs’ and ‘radio’ (13%). TV (9%), newspapers (7%) and extension workers (6%) were some of the other important sources. While these were the national averages, farmers in different States showed varying preferences.

### Box I. Access to Modern Technology for Farming, 2003

- At all-India level, 40% of farmer households accessed various sources of information for Modern Technology for Farming.
- At all-India level, of the sixteen different sources canvassed for accessing information for Modern Technology for Farming, the most popular was ‘other progressive farmers’ with percentage of farmer households accessing information through the source as 16.7%, followed by input dealer (13.1%) and radio (13.0%).
- Percentage of farmer households accessing information through ‘other progressive farmers’ was highest in Andhra Pradesh (34%), followed by Gujarat (30%) and West Bengal (25%).
- Percentage of farmer households accessing information through ‘input dealers’ was highest in West Bengal (36%), followed by Andhra Pradesh (30%) and Gujarat (24%).
- Percentage of farmer households accessing information through ‘radio’ was highest in Jammu & Kashmir (36%), followed by Kerala (31%) and Assam (29%).
- The two most popular sources, namely ‘other progressive farmers’ and ‘input dealer’ were contacted by the farmer households mainly on ‘need basis’ or ‘seasonally’.
- Among the farmer households accessing information for cultivation from ‘other progressive farmers’, 40% received information on ‘improved seed variety’, 31% on ‘fertiliser application’, 15% on ‘plant protection’ and 14% on ‘others’.
3.7.4.54. Over 50 per cent of farmers who received farming related information from sources like Radio, TV and Newspapers actually ‘tried’ the information or adopted the recommendations, whereas over 80 % of those who obtained the information from ‘input dealers’ or ‘other progressive farmers’ tried or adopted them. About 65 per cent of farmers who accessed information from extension workers or the ‘Krishi Vigyan Kendra’ actually tried or adopted. The different suggestions for improvement in extension services available to the farmers were: improvement in quality and reliability of information, timeliness of information, increase in frequency of demonstration, improvement of quality of presentation, and improvement of professional competence of information provider.

3.7.4.55. Among the farmers obtaining information from any source, 96 per cent obtained information on cultivation. As for the type of information on cultivation received by farmer households from any source, 60 per cent were on improved seed variety, 49 per cent on fertilizer application, 24 per cent on plant protection measures. Only 5 per cent of farmers obtained information on animal husbandry related topics and just under 3 per cent of farmers obtained information on fisheries. Most of the farmers rated the information received as ‘good’ or ‘satisfactory’. Only a small percentage of farmers rated the information received by them as poor.

3.7.4.56. The above findings call for the following policy changes and strategic alliances for bridging the information and technology transfer and adoption gaps:

- Strengthen information packaging and its transfer and communication for raising awareness of all stakeholders, from farming households to policy and decision-makers, regarding the role of new and emerging technologies in enhancing productivity, income and environmental sustainability.

- Although the low literacy rate prevailing in rural areas may be one of the main reasons behind 60 percent of the farmers being unaware of modern farming, alternative means of communication and demonstrations should be used to
raise the awareness of farming families. Illiteracy need not be equated with lack of intelligence and skill, as amply encountered in the fields of arts and crafts and in textile, agricultural machinery and automobile industries. Technologies that aim at value addition in the products of cottage/small scale industry can play a vital role in improving competitiveness of rural poor, including formally uneducated farmers. S&T can reach there in remotest parts of the country by emphasizing on skill training and on computer literacy, making it accessible even to those not having formal education. The ‘problem population’ can thus be converted into a valuable ‘human resource’ through activity-oriented training and skill improvement, helping to develop entrepreneurship and facilitating self-employment by using new technologies.

- Effectively implement the Every Village Knowledge Centre Movement and manage Gyan Chaupals to empower rural men and women by promoting and enhancing literacy and awareness at grassroots level especially on new and appropriate farming systems and season specific technologies, prices and marketing of inputs and agricultural produce and products and on disaster management and mitigation.

- Create virtual networks and partnerships to rapidly share information and knowledge and increase use of mobile phone which could operate in local languages to facilitate information diffusion and awareness-raising. New ICT technologies, such as e-agriculture, whereby agricultural information can be presented in multimedia formats to improve knowledge sharing in local cultural context, should be promoted.

- Recognising that input dealers and suppliers were second most common source of information, regular trainings of the dealers/suppliers/retailers should be organised not only to update their knowledge but also to improve their communication skills and attitudes to empower farmers with new information on inputs use and farming operations. “Hariyali Bazar”, “e-chaupal” and other such initiatives of the private sector and agriclinics should
be promoted. Innovative participatory extension approaches such as farmer-friendly “contract farming” should be encouraged.

- Since farmer-to-farmer learning and technology transfer was most frequent and was found reliable, as highlighted in our earlier reports, Farm Schools at the farms of and operated by farmer-achievers should be established in large numbers in different agro-climatic zones and farming system regimes.

- Farmer participation and feedback should become an integral part of agricultural research and technology transfer. Lab-to-land and land-to-lab programme should not only be revived but also vigorously pursued and suitably strengthened. Unfortunately, as the Survey revealed, the public sector extension system has become a lowly placed source of information and advice on modern farming systems. Considering that majority of our farmers are small and resource poor and depend heavily on public good technologies and information, the public sector agricultural extension men and women should be empowered and sensitised to meet the demands particularly by forging research – extension – education – farmer – market linkages. Through PPPs, including the synergies with KVKs (KVUKs), ATMAs, SHGs, SFEs etc., and with greater emphasis on facilitating transparent and timely adoption of various regulatory standards and guidelines to enhance access to quality inputs and markets, the public sector extension and ICT system should play a leading role in the Agricultural Renewal Movement.

- Paradoxically, the extension and information gaps in livestock and fisheries are the largest whereas these subsectors have been growing at a high annual growth rate of about 4 to 5 percent against 1 to 1.5 percent in cereals during the last five years or so. Extension and ICT services to these subsectors should be duly strengthened to further accelerate and sustain their growth rates at about 6 to 8 percent which would help step up growth rate of the agriculture sector as a whole to the desired level of about 4 percent. Livestock and fisheries extension cadres comprising adequate numbers of quality staff,
especially trained in disease prevention and management, and comprehensive training facilities should be established.

- Knowledge Connectivity should become fundamental to physical connectivity under the Bharat Nirman programme. As stated in the revised Bharat Nirman document regarding Knowledge Connectivity, the NCF welcomes the Government’s commitment to expanding rural knowledge connectivity. The NCF appreciates the GOI’s acceptance of its year 2005 recommendations to support VKCs and urges its urgent widespread operationalization. NCF recommends that Government may review its policy towards Community Radio, since a combination of the Internet/ cell phone and community radio will help to take timely information to farmers even in the remotest parts of the country and judiciously harness “air waves or frequencies which are public property.” NCF suggests that the extension and provision of community radio licenses should be streamlined and operationalised so as to reach the target community in the shortest period.

- In order to effectively adopt new technologies, the right inputs should be available at the right time and place at affordable costs. Input supply systems should become farmer-friendly and also controlled by Farmers’ Self Help Groups to the extent possible. Regulatory measures such as IPR, SPS, PVPFR etc. should be harmonised and made known to all parties. A National Agricultural Inputs Authority, on the lines of the Drugs Price Control Authority, to ensure flow of quality inputs should be established. The package of technology to be effective must be accompanied by an appropriate package of services in the areas of extension and input supply. Further, the energy sources needed by farm families, both electricity and diesel, should be available in a reliable manner and at affordable price. In addition, solar energy could be tapped where economical.
Partnership in Research and Technology Development

3.7.4.57. Policy measures should synergise three major partnership areas for intensification of generation, refinement and diffusion of modern technologies. These are: (i) public-private (industry)-universities-academia partnership, (ii) research-extension-farmer-market-consumer linkage and (iii) participatory research, technology assessment, refinement and transfer through farmers’ field research. Over the past few years, it has been increasingly recognised that greater coordination and cooperation between private sector and industry on the one hand and the R&D/academic institutions on the other is necessary for facing various challenges and taking advantage of the opportunities offered. In India, farming households comprise the largest private sector.

3.7.4.58. Participatory research and knowledge management is the key to promote relevance and effective adoption of technologies and new information by pursuing holistic and system–based approach for converging “global” knowledge to tackle local problems. The unique nature of agriculture makes agricultural R&D different from other sectors and makes extension vital. The context is different and other providers are emerging. A new ball game has been set up and our response has remained outdated. Clear enunciation of the roles of the Centre, States, local bodies, Panchayati Raj Institutions, private sector, and NGOs in a client-centred R&D structure is a critical task. Critical scientific and resource mass and modern management must back the human resources and research – extension – farmer – market – consumer linkage.

3.7.4.59. The awareness of mutual strengths and requirements of different stakeholders would require measures like: joint workshops/seminars and exhibitions; promotion of sandwich programmes involving attachment of students to an industry or to a farm or Farm School during their academic stints; establishment of sustained one-to-one linkages between R&D/academic institutions and the farming hubs, contract farming, SFEs and agro-industries located in a particular region; and setting up of accurate, upto-date, reliable, realistic and user-friendly database on indigenous
technological expertise/infrastructure, S&T personnel, R&D programmes, technological breakthroughs and innovations etc. For upstream agriculture-related industries, encouraging the mobility of S&T personnel between industry and R&D/academic institutions should be promoted. Academic institutions and R&D laboratories also need to organise appropriate training programmes for private sector personnel in order to cater to their specific requirements. Policy, procedures and systems should be reformed to encourage the academic faculty to accept contract/collaborative research for industry.

3.7.4.60. Interaction with the farmers and industry should not end with technology transfer but the agency providing the technology must constantly interact with the users problem solving, technology absorption, and improvement/upgradation of the technology. The Institute-Village linkage programme of ICAR needs to be revitalized and restructured. Government and industry associations should work together for the establishment of independent test facilities for reliable quality-checks, calibration and also for technology validation. Establishment of Industry S&T Interface Institutions (ISTI), with technology management centres manned by qualified personnel, could also be considered, besides the establishment of S&T entrepreneurship parks, Technology Business Incubators, upgrading R&D infrastructure of the industry through consortia of industry associations. Incentive/support measures would also need to be introduced for promoting the purchase of products developed through indigenous technologies. This approach should particularly be promoted in the areas of organic farming, pharma farming, biofertilizers and biopesticides etc.

3.7.4.61. Special emphasis should be given to identifying, promoting and supporting grass root innovations, adding value to them and disseminating them to ensure that the impact of such innovations is reflected in improved prospects of livelihood of a large number of people. Efforts should be made to design and develop or scout for advanced time and energy-saving tools/machineries and equipment, their adaptation, motivation of entrepreneurs to take up their manufacture and also encourage the innovators of advanced tools and equipments.
3.7.4.62. The developmental strategy with technological-orientation should focus on meeting the needs of the nation, including the majority small and resource-poor farmers and rural-based agroindustries and encompass a wide spectrum of activities, namely, basic research, applied research, technology transfer, design, development, fabrication, tests and trials, manufacturing, marketing, maintenance and product support during the life cycle. Often serious gaps are encountered in the cycle, depressing the overall efficacy of the chain. For instance, poor quality control in micro-irrigation has been the main cause of the sub optimal performance of pressurised irrigation in India. In the present liberalised environment, the increasing independence of corporate sector in agriculture should pay much more attention to external sources and upgrade its technology through radical technology jumps. It should anticipate and take advantage of technological changes, acquire appropriate new technology to develop and produce new products for the competitive markets, consistent with the home realities and needs of mass production by masses and not by machines (to avoid uprooting of livelihood bases without assured alternative employment).

3.7.4.63. Often the situation under which the scientific information is generated is unlikely to be same from those operated by the farmers. The scientific information is to be reviewed in terms of specific needs, opportunities and constraints faced by farmers in different production systems. The typical contrasts in physical conditions under which the farmers operate in terms of topography, soils, plot size, hazards, the facilities of irrigation, size of management unit, farming systems, nature of production stability, production sustainability, and priority for production need to be considered. The Small Farm Production Systems have some typical characteristics which include strong interaction between land and household economy, interlink of on and off farm activity, highly diverse, complex and risk prone activities even within systems, predominance of household inputs, prevalence of traditional practices, multiple enterprises primarily for domestic needs, production systems highly susceptible to stress and perturbations, and dependence on family labour and further sharing. The assessment and refinement of technology thus need to be site specific,
holistic, farmer participatory, and technical solutions to existing problems should be inter-disciplinary, interactive, iterative and gender sensitive.

3.7.4.64. Essentially the assessment and refinement of technology needs discipline to programme mode, piecemeal to system approach, open ended to focused technological intervention, “take it or leave” to demand-led approach, integration of biophysical and socio-economic factors, institute to inter-institute mode of technology assessment and refinement, and overall a strong research-extension to research-extension-farmer-market linkage and overall proper appreciation of distinction between science and technology. Different types of farmers’ participation are used for conducting on-farm trials for different purposes. In a truly participatory and collaborative, even collegiatic manner, the farmers must actively participate in on-farm trial process and be involved in regular meetings designed to clarify the logic, their current practices and their demand for new technology. The farmers must participate directly in the planning and execution of trials and analysis of the results and the knowledge should flow both ways.

3.7.4.65. While identifying the solutions from on-farm trial, it must be seen that the technology will function and its profitability, compatibility with the farming system, contribution to reducing risk, need for institutional support and ease of testing by farmers are duly considered. The assessment of trials should be based on net income to the farmer assessed through economic analysis and ability to solve the problem diagnosed through. The results of promising pilot activities should be extrapolated for defined groups of farmers in specific defined areas (clientele). The Farm School approach should be adopted for grassroots level training and technology diffusion, for which the R&D system must provide the needed financial and technical support.

3.7.4.66. Participatory (Farmer) breeding and knowledge sharing for development and diffusion of farmer-selected and scientist-assisted varieties combining proven adaptability to local agro-ecological, social and cultural milieu as well as possessing speciality traits (aroma, medicinal value and tolerance to local biotic and abiotic stresses) has emerged as an important strategy for harnessing treasures of our time-
tested and ever-evolving indigenous knowledge and genetic resources. Several national and international programmes viz. the CGIAR Centres and the Indo-UK (DFID) programme have been promoting this approach. Some of these have been remarkably successful. For instance, the farmer participatory rice improvement programmes of the M.S. Swaminathan Research Foundation on Kalajeera (a high quality aromatic rice) in Orissa and Navara (a medicinal rice in Kerala) have tremendous potential of enhancing income and livelihood security of farmers in those areas. Such initiatives should be strengthened through additional research and technology dissemination efforts by mentoring and supporting dedicated SHGs and by linking the producers with markets and by creating and capturing niche markets.

3.7.4.67. Participatory Research, Demonstration and Training (RDT) Centres should be farmer-centric and should concentrate on demonstrating how to increase the output and income of farmers with small holdings and artesenal fishermen. Precision farming, hi-tech horticulture, monsoon management and mixed farming will be important components of the training programmes. The proposed National Board for Strategic Research in Agriculture can work out the modalities of establishing such Centres at locations where the work done will have a large extrapolation domain. The concerned State Governments could be requested to provide about 100 ha of land free of cost for establishing RDT Centres. The Centres should be autonomous, and managed jointly by farm/ fisher families and scientists. Panchayati Raj Institutions should be associated with the design and management of RDT Centres. These Centres should be designed to serve as windows into the new world of agrarian prosperity that awaits rural India. They should have strong linkages with the relevant SAUs.

3.7.4.68 The SAUs/ ICAR Institute–KVK-Farm School system of technological and skill upgradation of farming needs continuous feedback and advice from farm men and women. In order to provide a structured opportunity for sustained scientist–farmer dialogue, it is suggested that a National Council of Innovative Farmers may be set up for providing on continuing basis guidance on the technology and public policy requirements for achieving productivity, quality and value-addition revolutions in the over 115 million operational holdings in our country. This Council may be serviced
by ICAR, with DDG (Extension) serving as the Convenor. Members of the Council of Innovative Farmers may be appointed by the President of ICAR in consultation with the National Commission on Farmers. A National S&T Alliance (Consortium) for Rural Livelihood Security with units in each district, may be established to synergise inputs of various concerned Departments and Ministries at grassroots level.

3.7.4.69. The proposed India – US Knowledge Initiative on agricultural research and education is a realization of the tremendous scope to complement the capabilities of the two countries being leaders in different fields of science and technology. The initiative is an effort towards addressing problems such as global warming, new pest-disease complexes - biosecurity, resource depletion and degradation, household nutritional security, slow growing farm profitability, and increased competition. Sharing of recent developments in cutting edge technologies, such as the use of microarrays for diagnostics and risk management, nanotechnology, etc. should be high on the agenda. While preparing the detailed action plan, ICAR and other components of the NARS should insist on accessing or jointly developing strategic and latest technologies as per the needs of India.

3.7.4.70. The IPR and other enabling regulatory measures should be harmonized nationally and internationally to reward the incentives as well as to protect the poor. The International Agricultural Research Centres (IARCs) of the CGIAR have long been interacting with the private sector, and mutually benefiting thereby. Some of the centres have formalized their collaborations through agreements. So far, the CGIAR system has been able to share its technologies and products as international public goods. The CGIAR policy must carve out a system which will allow a continuation of the free flow of technologies to the poor, without jeopardizing their partnership with the private sector. Financial and other supports should be extended to the CGIAR system to enable it to pursue frontline research to generate highly competitive technologies and to leverage benefits from the spillover effects. Linkages should be established among IARCs to build complementary Centres of Excellence and avoid duplication of efforts.
3.7.4.71. Private sector R&D institutions are growing in India, particularly in the areas of biotechnology and crop breeding. It is high time that we develop Codes of Conduct for public-private sector partnerships based on respect for each other’s obligations. Not-for profit R&D institutions also exist in the NGO sector which can also adopt the same Codes of Conduct as public-funded institutions in their partnerships with the private sector, where IPR, Breeders’ Rights and other forms of proprietary control over technologies and products of commercial significance are important. The Codes of Conduct should be developed through extensive consultation among all partners so that these could be used in the entire national scientific research system. The Commission recommends the following additional measures to further strengthen the partnership:

- Provide tax incentives, including tax holidays, so as to increase private sector’s contribution to R & D from 14% to 33%;
- Strengthen national capacities in regulatory matters, especially IPR, SPS and quarantine facilities to promote technology acquisition as well as trade;
- Encourage testing of new varieties bred by private sector and their other technological products in the public sector supported national technology testing programmes; and
- Undertake joint research activities with clearly defined responsibility, accountability and profit sharing.

**Technological Empowerment of Women**

3.7.4.72. Technology for women requires special attention and the impact of major on-going schemes (and any future schemes) on the knowledge and skills of poor, rural women engaged in farming and allied activities needs to be systematically studied. The lack of tools designed with women in mind is yet another area of concern. With the objective of empowering women in all fields of environmental management, including water harvesting, wasteland development, sustainable agriculture and livestock development, biodiversity conservation and its sustainable and equitable use, ongoing schemes should be “engendered” on priority basis.
3.7.4.73. Countries with lower achievement in the Human Development Index and Gender Development Index have a larger percentage of their economically active population (both male and female) employed in the agriculture industry. Second, these same countries have a higher proportion of economically active women involved in agricultural activities relative to men. The disparities are likely to increase as rural to urban migration continues to change the composition of rural areas putting even greater responsibilities for the growth of the agricultural sector on women than they already have. In aggregate, women in rural areas in the poorer countries will be impacted most heavily as the feminization of agriculture intensifies further. Agricultural technologies specifically designed to improve the efficiency and productivity of the female labour force will thus greatly improve overall agricultural productivity.

3.7.4.74. There is lack of analytical understanding of the gender inequality. Social research must provide disaggregated information on rural woman that can feed into policy formulation, and that can help articulate the strategic gender aspect of demographic transition. Meanwhile the following actions will help improve the situation:

- Promote full participation of women in all S&T activities.
- Encourage entrepreneurship among interested women by drawing up innovative schemes which help in the incubation and scaling up of innovative ideas which address the specific needs of women and establish special venture capital fund for enabling women entrepreneurs to take to a career of self-employment in converting new technologies into market driven products.
- Identify and promote micro enterprises based on assured and remunerative markets, low transaction cost and economic viability, preferably in horticulture, including medicinal and aromatic plants, village level agro-processing and value addition centres, organic farming, etc..
- Draw up well coordinated programmes to reach the rural women through well networked models for technology transfer, demonstration, dissemination and adoption and establish training and mentoring centres for the rural women on
the model of KVKs. Widows of farmers who committed suicide under agricultural debt burden and other related stresses should be trained in market-driven skills and assisted in establishing on-farm (livestock) and non-farm income earning enterprises.

- Establish rural technology parks which will also help in adoption of appropriate technologies, to address local problems like reduction in drudgery and occupational hazards, appropriate tools, identify income generating activities – provide a platform to assess the real needs and feed to S&T institutions as agenda for research.

- Engender the curriculum at the school level and technical education (Medicine/Engineering/Agriculture) level for gender sensitivity among future scientists and development personnel and strengthen S&T education and communication skills among community development workers.

- Engender all technology mission mode programmes and conduct periodic gender audit, the experience will help in preparing guidelines for the inclusion of women in other technology-based or technology-rich programme areas, especially the National Horticulture Mission, Bharat Nirman Programme, Capacity Building & Monitoring Centres for SHGs and revitalization of KVKs.

- Establish a Network of Women Scientists and Institutions interested in engendering the development through S&T based interventions to develop an end to end approach for the various agro-climatic zones. Such a national level action and policy research network should carry out longitudinal studies of women’s roles in agriculture and rural livelihoods in the various agro-ecological regions of the country, and also study the impact of S&T on livelihoods of rural women.

- Give greater focus to extension services in all areas of technology and build a strong cadre of women extension workers, who may be given frequent exposure for sharing these ideas with the members in the group. The various Acts, especially the BD, PVP&FR should be engendered and a literacy drive should be launched to understand them.
National Agricultural Biosecurity System

3.7.4.75. The recent and ongoing devastation and health risk due to the Avian Flu strain H5N1 is today’s one of the highest concerns not only of the Government and people of India, but of the whole world. Similar threats are around in plants, microbes, animals and aquatic organisms (as also the very humankind). Therefore, each nation must pay priority attention to management of biological risks and establish an effective, and efficient, science-based and transparent National Agricultural Biosecurity System (NABS) to protect the livelihood security of farm and fisher families and the health, food and trade security of the nation. The wheat economy and wheat-based food security of the country is threatened by a highly virulent stem rust race, Ug 99, which is fast spreading in Africa and has perhaps entered Middle East and may enter India sooner than later. ICAR’s work on animal and plant diseases and risk management must therefore assume extremely high priority for addressing these concerns.

3.7.4.76. Broadly speaking, Agricultural Biosecurity describes the concept, process and objective of managing – in a holistic manner – biological risks associated with food and agriculture, encompassing both policy and regulatory frameworks. Biosecurity is composed of three main sectors, namely, food safety, plant life and health, and animal life and health. These sectors include food production in relation to food safety, the introduction of plant pests, animal pests and diseases, and zoonoses, the introduction and release of genetically modified organisms (GMOs) and their products, and the introduction and safe management of invasive and alien species and genotypes. Accordingly, the proposed National Biotechnology Regulatory Authority should be a part of the National Agricultural Biosecurity System (NABS).

3.7.4.77. A National Agricultural Biosecurity Council (NABC), chaired by the Union Minister of Agriculture, should be established to provide a platform for convergence and synergy among the ongoing and new programmes of different Ministries and Departments and other national and international programmes. This should be supplemented by establishing a modern and adequately equipped and
staffed National Centre for Agricultural Biosecurity (NCAB) to dynamically provide technological tools and guidance for risk assessment and management. The existing biosecurity capacity of crop, livestock, fisheries and microbes should be strengthened and horizontally linked through a National Agricultural Biosecurity Network (NABN). Consequently, the NABC, NCAB and NABN will be the three mutually reinforcing components of the NABS. Necessary financial and human resources support to strengthen cutting-edge technology, viz development and use of microarrays for diagnostics and drugs, is essential for achieving the goal of a Biosecure India.

**Investments in R&D, Institutional Reforms and Revitalising the NARS**

3.7.4.78. It is heartening that the Government of India in its 2006-07 budget allocation has provided Rs. 100 Crore to Punjab Agricultural University, Ludhiana, Punjab for its strengthening and modernization. This is a welcomed beginning and is in line with the recommendations of the NCF’s Third Report. Reiterating its earlier recommendation, the Commission again recommends that a provision of Rs. 1000 Crore be made as a one-time grant to NARS to bridge the critical gaps in scientific infrastructure in frontier areas of technologies, so as to enable the Nation to enhance its agricultural competitiveness and to benefit from science-led Ever-green Revolution. This additional allocation will particularly strengthen work on conservation and improvement of livestock heritage of the Nation, genomics, bioinformatics, bioremediation and harnessing gene-richness of microorganisms, biomass utilization, value addition and use efficiency of plant nutrients and water. A National Board for Strategic Research in Agriculture may be set up to coordinate and harness advances in basic sciences for agricultural progress.

3.7.4.79 The uncommon opportunities provided by the frontier technologies should be captured for launching an ever-green revolution capable of improving productivity in perpetuity without ecological harm. In order to ensure social inclusion in access to new technologies, public investment in socially relevant agricultural research should be stepped up under the umbrella of the National Agricultural Research System which
comprises large numbers of ICAR institutions, State Agricultural Universities, All India Coordinated Research Projects and National Bureaus. Private sector institutions and NGOs carrying out research should also be encompassed under the NARS umbrella. Fighting the technology fatigue, and technology upgrading of small farm operations are urgent tasks.

3.7.4.80 Climate change leading to adverse changes in temperature, precipitation and sea level is no longer just a theoretical possibility. Most experts agree that we are already beginning to experience the impact of global warming as evident from the melting of glaciers and Antarctic and Arctic ice caps. Based on computer simulation models, contingency plans and alternative land and water use strategies will have to be developed for each major agro-climatic zone. Just as grain reserves are important for food security, seed reserves are important for crop security. Protecting the livelihood security of farm and fisher women and men from adverse climatic changes has to become a priority task of the National Rainfed Area Authority. In drought and flood prone areas, experienced farm women and men can be trained as “Climate Managers”.

3.7.4.81. The NARS covers the entire spectrum of crop, fishery, forestry, natural resources and agro processing and agri-business. However, there are gaps in several areas awaiting redressal or are not receiving focused attention. Some of such areas, as listed below, require more intensive and inter-disciplinary attention.

- Climate change and its implications,
- Harnessing space, ICT, nanotechnology and other frontier technologies for precision farming,
- Organic recycling and value addition to biomass, biofuels and bioenergy,
- Crop-livestock-fish integrated production systems,
- Pre-breeding and participatory breeding, and
- Scientific organic farming.

3.7.4.82. The Commission recommends setting up of new National Centres / Institutes in the above areas or mandate existing ones to address those areas
specifically. Such institutions could be set up in existing ICAR institutes or SAUs or institutes of other relevant Ministries but should be functionally and financially autonomous with their own Governing Boards. In the Commission’s view, the institutions should be built around outstanding scientists and research leaders of proven capability in these fields. Such committed research leaders should be first identified and involved in the project design process. The National Challenge Programmes (identified by the Task Group and other committees) should likewise be led by scientist–achievers.

3.7.4.83. The premier research institutes, such as IARI, IVRI, should be designated as Institutions of National Importance. The Commission recommends that such institutes should be given special funds and organizational and management supports to empower them to enrich the Indian agricultural knowledge system necessary for enhancing country’s competitiveness at the global level on one hand and to serve the majority small and marginal farmers, often inhabiting vast rainfed drylands and other poorly endowed non-congenial agro-climatic regions, on the other. A National Council for Global Leadership in Agricultural Science and Education should be set up under the chairmanship of the Minister for Agriculture to give guidance to these new initiatives and to position India as a leading player in international agricultural R&E system.

3.7.4.84. It is strongly recommended to increase the R&E intensity to 1.0 percent (from current level to 0.34 percent) of AgGDP. The existing serious imbalances in funds allocations to different agro-ecological regimes and commodities should be corrected by allocating larger proportions to eastern region to harness the high untapped agricultural growth potential, as also to rainfed arid and semiarid drylands and to livestock and fisheries subsectors. The resources recently allocated to the National Horticulture Mission need to be aligned to priority areas for technology development for prevention of post–harvest losses, processing, value addition, development of specialty varieties (viz. for processing) and production and distribution of quality planting materials.
3.7.4.85. A package of reforms aimed at enhancing autonomy, improving decentralization and devolution of power, and improved financial management through built-in monitoring and evaluation is required. Both ICAR and SAUs should commit themselves to such reforms. Support of high level policy makers at both the Central government and State government levels is needed to implement this far reaching reform agenda.

3.7.4.86. The following additional policy reforms by Central and State Governments are recommended:

- Balance expenditure per scientist in SAUs at par with ICAR.
- Maintain critical levels of scientific and resource mass in different ICAR Institutes and SAUs.
- Enhance share of operational expenses of scientists.
- Dedicate adequate public funds to promote basic and strategic research as well as to develop human capital.
- Promote competitive funding for networking, institutional reforms, addressing R&D challenges.
- Strengthen project-based funding with clearly defined outlay-outcome matrix on the lines of The Log Frame Options.
- Evolve National Innovation System aligning policy, incentives and regulations to foster innovation and entrepreneurship.
- Establish Genius Awards for young scientists to attract talented youth to agricultural research, technology development and education.
- Strengthen IPR regime for technology transfer, resource generation and evolving competitive market with due provision for social inclusion in access to new technologies.

3.7.4.87. SAUs are generally starved of operating funds and now largely depend on ICAR. The shortage of funding in the SAUs has had adverse effects on human resources development, research infrastructure, and linkages with farmers. There is an urgent need to sensitize policy makers at the State level to the payoffs to investing in
research. At the same time, the Central Government might develop a funding formula that supports the weaker States, but provides incentives to stronger States to increase their funding (e.g., matching grants). A key role of Central research is to generate spillovers to enhance efficiency in State research programmes.

3.7.5.0. Epilogue: Summary Policy Recommendations

3.7.5.1 Technological upgradation of Indian agriculture is a core element of the agricultural development strategy. The Green Revolution, built through synergy of technology, policy, services and farmers, ushered in 1968, resulted in tripling of foodgrains production (80% through yield enhancement), which more than halved percentages of hungry and poor people, enhanced employment and farmers’ income, and increased food self-sufficiency and national confidence.

3.7.5.2 Today, however, India’s agricultural growth rate (1.5%) has slipped below the population growth rate (1.8%), against the overall GDP growth rate of nearly 8%. While agriculture’s contribution to national GDP has decreased to about 20 percent, it employs about 60 percent of the country’s workforce. These have serious implications for economic growth, food security, equity and rural welfare. The “champagne glass” has further truncated. Stubbornly high incidence of hunger and poverty, technological fatigue, serious yield gaps, huge post-harvest losses, decreasing net trade intensity, low and stagnant farmers’ income, declining holding size and widening rural-urban (Bharat-India) divides are matters of serious concern. Investment and capital formation in agriculture has drastically declined while the dependence on agriculture for livelihood security continues to be extremely high.

3.7.5.3 The “business as usual” will thus not do and agriculture can not be made to wait. The problems of Indian agriculture and farming community should be diagnosed more systematically and critically and disaggregated over the different agro-ecological regions and socio-economic regimes so that effective malady-remedy combinations could be put in place. Policy provisions should support the following thrust areas:
• Protecting yield and productivity gains, extending the gains to new areas, and enhancing yield ceilings and achieving new gains; bridging yield gaps; minimizing post-harvest losses, augmenting value addition and improving productivity and farmers’ income; and promoting eco-technologies rooted in the principles of ecology, economics, equity and employment towards an Ever-green Revolution.

• Exploiting the gene revolution (biotechnology); benefiting from information and communication technology revolution, space, nuclear and nanotechnologies; and promoting knowledge-based precision farming systems, intensification and diversification.

• Protecting and improving natural resources (land, water and biodiversity); addressing environmental concerns, ecological security, agricultural biosecurity and sustainability; and managing climate change and natural disasters.

• Seeking congruence of productivity, profitability, sustainability and equity; addressing gender issues and problems of the poor and the excluded, particularly of small and marginal farmers and land-less agricultural labourers; and managing liberalized trade in the globalized world by addressing issues related to global competitiveness in the context of the WTO/AoA.

3.7.5.4 More specifically, the following aspects will be front runners:

• The accent on horticulture, livestock, fisheries, specialty enterprises, value-added products, precision farming, organic farming, biomass recycling and energy farming and market-driven diversification should further be intensified.

• Rising capital intensity, high premium on quality, food, health and environmental safety and increasing concerns of biosecurity, climate change, gender issues and sustainability must be addressed by research and technology development programmes.
• Yield growth rates of foodgrain crops should be restored to about 2.5 percent and the horticulture, livestock and fisheries production growth rates should be raised to about 6 percent and above so as to achieve the stipulated overall agricultural growth rate of 4 percent.

• The needs and prospects of rainfed dryland and semi-arid areas, hill and mountain agro-eco systems and other noncongenial areas must be addressed on priority basis, including the increased use of participatory breeding and other participatory researches by effective involvement of grass root people.

• Several of the above issues should be designated as National Challenge Programmes and, based on critical gap analysis, should be institutionalised under the leadership of scientist-achievers.

3.7.5.5 Observing that the (first) Green Revolution has run its course, and reiterating his commitment to science- and knowledge-led transformation of the agrarian economy, the Prime Minister, in his call for a Second Green Revolution, in keen to move towards an Ever-green Revolution which must build on but avoid the pitfalls and weaknesses of the First Green Revolution. The move should adopt the following three-pronged approach:

• Prioritise strategic research and technology development programmes, including cutting-edge technologies, geared to meet the technological problems retarding and decelerating agriculture-led growth and development and to achieve desired competitiveness, efficiency, productivity and income growth alongwith desired sustainability and inclusiveness.

• Realize that science and technologies must have a human face and cannot operate in a vacuum. Therefore, it is absolutely necessary to formulate clear cut goals, policies, strategies and programmes and adopt participatory (and proprietary when necessitated in national interest) approach for harnessing the (unlimited) power of science and for synergizing technological and social revolutions by duly enhancing social science research capacities and building bridges and partnerships among policy makers, scientists, development practitioners, farmers and other stakeholders.
• The National Agricultural Research System, the Technology Assessment and Transfer System, the Knowledge System (skill development, re-tooling, indigenous knowledge), the Humanware aspects, Enabling Mechanisms (IPR, SPS) and Services must be synergistically aligned, restructured and revitalized. The perpetuating functional rigidities and lack of responsive institutional support and mechanism should be overcome to impart efficiency, transparency and accountability at various levels.

3.7.5.6 A package of reforms aimed at enhancing autonomy, improving decentralization and devolution of power, and improved financial management through built-in monitoring and evaluation is required. Both ICAR and SAUs should commit themselves to such reforms. Support of high level policy makers at both the Central government and State government levels is needed to implement this far reaching reform agenda.

3.7.5.7. The following additional policy reforms by Central and State Governments are recommended:

• Balance expenditure per scientist in SAUs at par with ICAR.
• Maintain critical levels of scientific and resource mass in different ICAR Institutes and SAUs.
• Enhance share of operational expenses of scientists.
• Dedicate adequate public funds to promote basic and strategic research as well as to develop human capital.
• Promote competitive funding for networking, institutional reforms, addressing R&D challenges.
• Strengthen project-based funding with clearly defined outlay-outcome matrix on the lines of The Log Frame Options.
• Evolve National Innovation System aligning policy, incentives and regulations to foster innovation and entrepreneurship.
• Establish Genius Awards for young scientists to attract talented youth to agricultural research, technology development and education.
• Strengthen IPR regime for technology transfer, resource generation and evolving competitive market with due provision for social inclusion in access to new technologies.

3.7.5.8. Codes of Conduct should be introduced for public-private sector partnerships based on respect for each other’s obligations, where IPR, breeders’ rights and other forms of proprietary control over technologies and products of commercial significance, are important. The code of conduct should be developed through extensive consultation among all partners and can be used in the entire national scientific research system.

3.7.5.9. In order to promote investment in agricultural research by private sector, the following suggestions may be considered:

• Provide tax concessions and tax holidays to promote private sector’s contribution to R&D from 14 percent to 33 percent.
• Strengthen regulatory mechanisms, especially IPR, SPS and quarantine facilities, to promote technology acquisition. In doing so, however, ensure social inclusion in access to technologies and devise mechanisms for timely delivery of the technologies needed by the resource-poor.
• Encourage testing of private sector’s new varieties and other technological products by public sector regional and national testing programmes.
• Undertake joint research activities with clearly defined responsibility and accountability of and profit sharing by various partners.

3.7.5.10. SAUs are generally starved of operating funds and now largely depend on ICAR. The shortage of funding in the SAUs has had adverse effects on human resources development, research infrastructure, and linkages with farmers. There is an urgent need to sensitize policy makers at the State level to the payoffs to investing in research. At the same time, the Central Government might develop a funding formula that supports the weaker States, but provides incentives to stronger States to increase...
their funding (e.g., matching grants). A key role of Central research is to generate spillovers to enhance efficiency in State research programmes.

3.7.5.11. In order to enhance effective technology transfer and to bridge the yield and other performance gaps at various levels, the Commission recommends the following:

- Convert the Krishi Vigyan Kendras into Krishi and Udyog Vigyan Kendras in order to give concurrent attention to on-farm and off-farm livelihood and to promote end-to-end approach and to link production with marketing and consumption.
- Establish 50,000 Farm Schools in the fields of farmers-achievers to spread proven technologies through farmer-to-farmer learning.
- Integrate the activities of KVKs, ATMAs (Agricultural Technology Management Associations), Lab-to Land and Land-to Lab programmes, Self Help Groups, agricultural cooperatives and other grassroot institutions.
- Establish National Participatory Research, Demonstration and Training Centres to integrate available scientific institutions, extension programmes and grass-root institutions related with agricultural development including the proposed initiatives, namely, Farm Schools, Soil Health Cards, Kisan Credit Cards, Agriclinics and Agribusiness centres.
- Establish a National Council of Innovative Farmers to provide a structured opportunity for sustained scientist-farmer dialogue.
- Establish National and local level Science and Technology Alliances (Consortia) for rural livelihood security.
- Increase the involvement of small holders in public-private partnership in high-value agriculture by integrating the small-holders with the high-value agricultural and supply chain and making necessary provisions forremedying market failures and structuring the SFEs on the NDDB model.

3.7.5.12. The recommendations of the Swaminathan Task Group on Revamping and Refocusing of National Agricultural Research to meet current challenges and those of
the Mashelkar Committee on Reorganization of ICAR should be examined and the accepted ones should be implemented without further delay.

3.7.5.13. The ongoing revolutionary breakthroughs in biological, information and other related sciences and technologies offer great hope for meeting the earlier-mentioned challenges. Fortunately, there is a convergence of political will to capture these breakthroughs for improving livelihood security of farmers and the other ‘left outs’. However, the convergence was not duly reflected in the 2006-2007 budget allocation of the Government of India, and the country is way off the track in meeting the Millennium Development Goals. Scientists should actively participate in the policy debate leading to investment decisions. Concrete actions in terms of financial allocations, institutional and infrastructural support, human resources quality and number, and producer-market and backward–forward linkages are urgently needed.

3.7.5.14 Investment in agricultural research and education should be increased from current level of 0.34 percent of the agricultural GDP to at least 1 percent. The Government policy makers, scientists, public sector, private sector, farmers and other partners in agricultural development must strike a new pace and synergy, otherwise we will make little progress towards meeting the daunting challenges of climate change and globalisation, among other challenges, and would not reach the unreached – the one–quarter of the World’s hungry and poor who have their homes in India.

3.7.5.15. As highlighted in the Third Report of the NCF, a provision of Rs. 1000 Crore as a one–time grant to NARS is required to bridge the critical gaps in scientific infrastructure in frontier areas of technologies, so as to enable the Nation to enhance its agricultural competitiveness and to benefit from science–led Ever-green Revolution. This additional allocation will particularly strengthen work on conservation and improvement of livestock heritage of the Nation, genomics, bioinformatics, bioremediation and harnessing gene–richness of microorganisms, biomass utilization, value addition and use efficiency of plant nutrients and water. A
National Board for Strategic Research in Agriculture may be set up to coordinate and harness advances in basic science for agricultural progress.

3.7. 5.16. “We have miles to go”. But, we must reach there in time. Already nearly 160 districts have been declared as suffering from Naxalite activities. The existing serious imbalances in funds allocations to different agro-ecological regimes and commodities should be corrected by allocating larger proportions to eastern region to harness the high untapped agricultural growth potential, as also to rainfed arid and semiarid drylands and to livestock and fisheries subsectors. The National Horticulture Mission and other such Missions should be technology-rich and technology-driven and not subsidy-rich and subsidy-driven.

Acknowledgement

National Commission on Farmers appreciates the contribution of National Centre for Agriculture Economics and Policy Research (NCAP), New Delhi, particularly of Prof. Dayanatha Jha, Former National Professor, ICAR, Dr. Ramesh Chand, Acting Director and Dr. Suresh Pal, Principal Scientist, of the Centre, towards completion of our this study.
CHAPTER 3.8
GUIDING PRINCIPLES UNDERLYING THE DRAFT
NATIONAL POLICY FOR FARMERS
CREDIT AND INSURANCE

3.8.1 Credit is a critical input for development of agriculture and activities allied to agriculture. The key task is to ensure a convergence among credit availability, effective credit delivery system and adequate credit absorptive capacity of the farmers. The mere availability of credit does not ensure its productive use and increased production/value addition. The Advisory Committee on flow of credit to Agriculture and Related Activities [2004] appointed by the Reserve Bank of India under the Chairmanship of Prof. V.S. Vyas has rightly observed “credit must reach all its users effectively; it must be on time, in required quantities and addressed to the right activity mix. Raising agriculture to higher thresholds to usher in value added, hi-tech enterprises require strengthening the delivery system. These tasks begin at home of the rural financial institutions: cooperatives, regional rural banks and the rural branches of the commercial banks. Their organisation must allow flexibility of approach, innovations to meet new needs, empathetic treatment of the clientele and responsiveness. All these call for changes in organisational structures, procedures and above all, the mindset of those who manage the system.”

3.8.2 The rural banking system in India has adopted a multi agency approach. There are four sets of institutions providing financial services in the rural areas. These institutions are the commercial banks both in public and private sector with a large network of rural branches, cooperative credit structure [three tier federal structure in most of the States i.e., the State Cooperative Bank (SCB) at State level, the affiliated District Central Cooperative Banks (DCCBs) at district level and the Primary Agriculture Credit Societies (PACS) at the village level; in some of the smaller States, the structure has two tier with State Cooperative Bank at State Level and Primary Agriculture Credit Societies at village level affiliated to the SCB], the long term credit under the cooperative system is met through the State Cooperative Agriculture and Rural Development Banks.
[SCARDBs] at State level with branches or affiliated Primary Cooperative Agriculture and Rural Development Banks [PCARDBs] at tehsil or block level and finally the Regional Rural Banks [RRBs]. While the cooperative banks lend for agriculture and activities allied to agriculture mainly through the cooperatives, the RRBs were established to focus on small/marginal farmers, agricultural labourers and artisans etc. The commercial banks in addition to general banking functions are bound by the guidelines issued by the Reserve Bank of India to lend 40% of the aggregate credit to the priority sector. These banks are expected to have at least 18% of the net outstanding credit for agricultural purposes of which 75% has to be for direct agriculture loans.

3.8.3 In the pre-independence period, agricultural credit to farmers was exclusively provided by the cooperative banking system with the exception of plantation finance by the commercial banks and taccavi loans by the Government. This credit system had no explicit relationship with input supply or farm investment and was really seen as an alternative system to village moneylender. The institutional credit was extremely small and formed about 7.2% of total debt outstanding of the rural households in 1951. The most notable developments in the rural credit since independence have been the Report of the Rural Credit Survey [1954], conversion of the Imperial Bank of India into the State Bank of India to extend banking facilities in the countryside, the formation of the Agriculture Refinance Corporation [the forerunner of the Agricultural Refinance and Development Corporation and the National Bank for Agriculture and Rural Development [1982], the introduction of the Banking Regulation Act, 1965 [as applicable to the cooperative banks], nationalisation of private sector banks [1969], the setting up of Regional Rural Banks [1975], the instructions of the Reserve Bank of India to the public sector banks about Credit Deposit Ratio [CDR] in 1980 and achieving the target of 18% of net bank credit for lending to agriculture to be met by March, 1990 [however, only 9 of the 27 public sector Banks had achieved it by end March, 2004]¹, introduction of the scheme of linkage of the Self Help Groups [SHGs] with the banking system in 1991-92 for micro finance, introduction of the Rural Infrastructure Development Fund [RIDF] at

¹ Even by end of March 2005, the aggregate credit outstanding to agriculture formed 15.7% of net bank credit in the case of public sector banks and 12.1% in the case of private sector banks. [Source: Trends and Progress of Banking in India: 2004-05]
the National Bank for Agriculture and Rural Development [NABARD] in 1995-96 wherein the banks which failed to meet the target for priority sector/agriculture contributed an amount based on their shortfall to the RIDF, the Kisan Credit Cards [KCC] in 1998 and the announcement of the ‘farm credit package’ by the Government in June, 2004 which envisaged doubling the flow of credit to agriculture in ensuring three years.

3.8.4 The objective of the agricultural credit policy in India since independence has been gradual replacement of moneylenders initially by credit cooperatives and later on by multi agency approach [including asking commercial banks to open more branches in rural areas and establishment and expansion of the Regional Rural Banks] and lowering of the interest rates. It was hoped that these would relieve the constraints on agricultural growth. This was also considered income - transfer mechanism in favour of the poor farmers. The policy bias in favour of lower interest rates on agriculture credit continues with commercial banks deciding to charge interest not exceeding their Prime Lending Rates [PLR] to agricultural borrowers and the announcements in the Union Budget 2006-07 regarding a 2% rebate on interest in respect of crop loans issued during 2005-06 and also the decision to ensure that the farmer receives short term credit at 7% per annum, with an upper limit of Rs. 3,00,000/- on principal amount [Government to give subvention to ensure this].

3.8.5 There is no doubt that agriculture credit has increased considerably and shown more than 14% growth per annum on a decadal basis. The share of institutional credit in total cash borrowings by the cultivator households in rural area increased from 21.7% in 1971-72 to 56.2% in 1981-82, declined to 55% in 1991-92 and again increased to 59.5% in 2002-03. [All India Debt and Investment Survey - NSS 59th Report - Household Borrowings and Repayments in India during 2002-03]. In absolute terms, the total credit flow during 2004-05 was Rs. 1,25,309 crore against the target of Rs. 1,05,000 crore showing an increase of 44.1% over the previous year. Against the target of Rs 1,41,000 crore for 2005-06, the disbursements by 31st December, 2005 had already reached Rs. 1,17,899 crore [Economic Survey 2005-06]. The flow of institutional credit during the last few years is shown in Table 1.
Table 1: Flow of Institutional Credit to Agriculture

Incidentally, the total institutional credit to agriculture during 1997-98 was only Rs 31,958 crore and registered an increase of over 392% between 1997-98 and 2004-05.

The direct agricultural loans outstanding in the case of the scheduled commercial banks had reached Rs. 1,22,370 crore as at the end of 2004-05 as compared to Rs. 90,451 crore as at the end of 2003 - 04.

3.8.6 However, despite the substantial increase in agriculture credit particularly during the last two years, there are certain issues which deserve attention. The first and the foremost is the question of the outreach of the formal credit institutions in the rural areas. According to the NSS Report No. 498 –Situation Assessment Survey of Farmers – Indebtedness of Farmer Households - NSS 59th Round - May 2005, the professional moneylenders had the highest percentage of farmer households indebted to them. The position is shown in Table 2.

3.8.7 The findings of the Rural Finance Access Survey done by the World Bank and the NCAER in Andhra Pradesh [AP] and Uttar Pradesh [UP] 2003 also reveals that only 24% of the total rural households in AP and 19% in UP had access to formal credit while 56% and 51% of the households in those two States respectively depended on private credit sources. Access to formal credit by types of households is shown in Table 3.

3.8.8 It is disturbing that after nearly 37 years of the nationalization of the private sector banks and over 15 years of credit targeting for agriculture, on all India basis, the banks had a smaller outreach of the Indian farmers as compared to the professional moneylenders. [NSS 59th Round Report referred earlier] In Andhra Pradesh, Bihar, Manipur, Meghalaya and Rajasthan, the combined outreach of the banks, the cooperative societies and the Government [the entire formal sector put together] was less than the professional moneylenders. In addition, the moneylenders had the largest outreach among all sources in Karnataka and Tamil Nadu. The traders had the best outreach among all agencies in West Bengal, Jammu and Kashmir, Nagaland and Sikkim. The friends and relatives were the most common source of funding to farmer households in Arunachal Pradesh, Assam, Himachal Pradesh, Manipur, Meghalaya, Mizoram and groups of Union Territories.

3.8.9 The formal credit agencies i.e., the banks had the best outreach only in Jharkhand, Orissa, Tripura, Uttar Pradesh and Uttarakhand; the cooperatives had the best outreach in Chhattisgarh, Gujarat, Haryana, Kerala, Madhya Pradesh, Maharashtra and Punjab. The continued poor financial health of the credit cooperatives is a major issue in improving the outreach of the formal system. Keeping in view that the credit societies had the largest outreach in as many as seven States including agriculturally important States like Punjab, Haryana, Gujarat, Maharashtra, Madhya Pradesh and Kerala the issue
regarding revitalisation of credit cooperatives\(^2\) which is under discussion for well over a decade, needs to be implemented on a priority basis.

3.8.10 **Besides the low outreach another issue is the low Credit Deposit Ratio [CDR] of the rural and semi urban branches and the declining trend observed during the nineties.** The Reserve Bank of India had advised the public sector banks to achieve a CD ratio of 60% in rural and semi-urban branches separately, across India. In a circular dated June 18, 1980 issued to the public sector banks, the RBI advised that, “While it is not necessary that this ratio should be achieved separately branch-wise, district-wise or region-wise, the banks should, nevertheless, ensure that wide disparity in the ratio is avoided in order to minimize regional imbalances in credit deployment”. The instructions were reiterated to public sector banks in 1995. However, the CD Ratio for rural offices of the Scheduled Commercial Banks showed a continuous decline between 1991 to 2001 is shown in Table 4.

\(^2\) A number of Committees/Groups have examined this issue including Shri Jagdish Capoor Committee, State Minister’s Group under Shri Bhikhe Patil and Shri Vaidyanathan Committee in the last about 10 years.
3.8.11 While the number of deposit accounts with rural offices of the Scheduled Commercial Banks increased by nearly 21% between 1991 and 2001 the number of credit accounts [borrowals] declined by 30.12% [from 322.82 lakh to 224.58 lakh] in the same period and the credit deposit ratio continuously declined. Further, while, the decline in credit-deposit ratio of the rural branches is in line with the overall decline in CD Ratio, the decline in the case of rural branches has been steeper as shown in Table 5.

3.8.12 Besides the low outreach, low credit deposit ratio, the other issue is that the proportion of small and marginal farmers accessing formal credit is much lower than the comparatively bigger farmers. This has been revealed by the RFAS - 2003 referred to earlier. The NSS Report No.498: Indebtedness of Farmer Households - 2003 also reveals that the smaller land holders primarily rely on informal sources for their credit needs as shown in Table 6.

375
The above data clearly presents that the informal sector had provided 77.4% of the debt outstanding from the farmers owing less than 0.01 hectare land and similarly 56.7% from farmers owing upto 1 acre land [0.40 hectare]. The moneylenders were the largest suppliers of credit to these categories of borrowers. As the land owned increased, the access to formal agencies for credit improved and it was 65% and above in case of all land owners possessing more than 2 hectare. The traders had met 10.6% of the credit outstanding of farmers possessing more than 10 hectare. In case of most other farmers it was around 4 to 6%. However, in no category of landowners, the share of informal agencies fell below 31.2% and moneylenders share below 16.7% indicating that the informal agencies and particularly the moneylenders are still an integral part of the rural financial system and even the bigger cultivators borrow from them.

3.8.13 Extremely low coverage of marginal and small farmers by the formal institution is a serious issue both from the borrower’s and lender’s view point as also from equity considerations. From the demand side, the small/marginal farmers generally do not have easy access to credit and a substantial part of credit they obtain is from informal agencies where the loan terms are often exploitative. This is despite credit targeting for commercial banks for agriculture/ weaker section etc. As per the current guidelines, the commercial banks are required to extend not less than 10% of the net bank credit to weaker sections comprising small/marginal farmers, landless labourers, artisans and borrowers under the Government sponsored poverty alleviation programme etc. However, as on 31st March, 2003 public sector banks had extended only 6.8% of the net bank credit to weaker sections. Only six out of 27 public sector banks had achieved the 10% target, with the rest ranging between 2% and 9.4%. The position has marginally improved by the end of March 2004, when 7 public sector banks had achieved the target and the overall achievement had reached 7.44% but was still lower than the target.

3.8.14 An important connected issue is that the credit requirements of the rural people are varied in nature. They not only require credit for agriculture operations and other income generating activities but also for consumption purposes and for meeting medical/educational/other social expenses. As a matter of fact the small and marginal farmers’ borrowing for consumption and other purposes far exceeds the loans
for income generation activities. Table 7 indicates the purpose wise break up of loan outstanding according to land possessed by farmer households in India.

3.8.15 As the size of the land possessed increases [upto 10 hectare] the proportion of loan outstanding for production purposes show a continuous increase and loans for other purposes a decline. The proportion of loans for purposes other than income generation is as high as 71.5% and 64.9% in case of farmer household possessing less than 0.01 hectare and between 0.01 hectare to 0.40 hectare respectively. Loans for purposes other than income generating were lowest at 16.8% [for farmer households possessing 4 to 10 hectare land]. This shows that if the formal credit system continues to fail in meeting all credit needs of the farmers, the reliance on moneylenders and other informal agencies would continue and there would also be chances of diversion of money from the purpose for which credit was approved to other purposes. Greater flexibility in approach from the formal credit agencies and introduction of different credit products are needed. The
purpose wise loan outstanding of farmers possessing land upto 1.0 acre [0.4 hectare] needs a closer look. The loans outstanding for consumption and medical purposes for farmers possessing less than 0.01 hectare and upto 0.40 hectare land at 34.2% and 21.8% respectively of the total debt outstanding are very high. Bulk of these is also likely to be from the moneylenders and other informal agencies on unfavourable terms compounding the problem. A high percentage of loans for consumption and medical purposes could mainly be due to [a] uneven income streams and volatile nature of expenses, necessitating loans for smoothening funds inflow or [b] non-viable nature of the employment/profession of the borrowers. In the case of [a] the banking system could make efforts to find solutions and assume that the savings [uneven income flow] could be collected and in time of need loans could be provided. The strategies of the financial system for the situation could be to expand the micro finance programme and the banks introducing greater flexibility and new credit products suiting the needs of small/marginal farmers. It is important that the micro finance institutions including the Self Help Groups [SHGs] complement the efforts of the formal institutions. While the banks and other formal credit institutions are better placed [both resource and capacity wise] to meet the larger credit requirements and also long term loans, the micro finance institutions could meet the short term and emergent requirements of smaller amounts. The stronger linkage between the Self Help Groups [SHGs]/other financial institutions is needed. The SHGs/MFI’s could recommend their members who have good credit history for need based larger loans from the banks and also do some monitoring/keeping an eye over such borrowers which would help in reducing the transaction/supervision cost of the banks. Under the SHG - Bank Linkage Programme, the emphasis so far has been on ‘outreach’. The complementarities between the informal structures and formal banking system need greater emphasis. The approach can not be credit from formal institution or credit from micro finance institutions. The micro system has developed in our country with almost exclusive reliance on SHG - Bank Linkage Programme. This outreach programme in no way could be considered a substitute for the whole range of financial services which the farmers need from the banks. The question is that of financial exclusion of a large part of rural population which needs attention. However, the situation at [b] can not be handled by the financial system and requires relief, development of human capital, increasing
incomes and creation of more gainful employment opportunities. Development of land lease markets or land markets in due course could also help.

3.8.16 The SHG - Bank linkage Programme has already become the largest and fastest growing micro finance outreach programme in the world [nearly 2 million SHGs have been linked to the banks and the credit flow through the SHGs is nearly Rs. 4000 crore per year], efforts are now needed to further expand this programme particularly in Eastern and North East Region, U.P., M.P., Maharashtra, Rajasthan and Gujarat where the growth of this programme is much lower as compared to southern States. The programme is also attracting criticism such as:

- It has become a numbers game without adequate emphasis on quality of SHGs.
- Credit extended through the SHGs is not adequate to improve the member’s income substantially.
- The poor require ‘livelihood finance’ rather than mere micro finance.
- By showing micro finance as a very successful programme and emphasising about its expansion both the banks and the State are not giving adequate attention to making qualitative improvements in delivery of agricultural credit.

3.8.17 While the constraints in the agricultural credit are discussed subsequently, the issue of the outreach which is extremely important particularly for the sub-marginal/marginal farmers, landless agriculture labour etc. has been discussed both from the supply side and the demand side in the following paragraphs.

3.8.17.1.0 Inadequate Access of Rural Poor – Supply Side Issues

The Transaction Cost

3.8.17.1.1 The transaction cost of rural lending in India is high primarily due to small loan size, large geographical spread and heterogeneity of borrowers. As the loan size increases, the transaction cost per unit of rupee lent comes down. Since agricultural loans are small and frequent the transaction cost is high. The lack of literacy and familiarity with documentation requirements among the rural borrowers adds to the problem. Really
speaking, the modern banking system/procedures/documentation requirements were not exactly designed for very small borrowers seeking small loans. Lot of innovation and investments in ATMs, IT etc. are needed to reduce the transaction costs. The supervision cost of small rural loans is also quite high due to low density of borrowers/credit

The Risk Cost

3.8.17.1.2 From the bank’s view point, in the case of rural poor there is greater uncertainty about their repayment capacity, their irregular and volatile income and expenditure pattern, possibilities of diversion of production loans towards meeting consumption requirements and consequently higher default risks. These problems are compounded by the non availability of suitable collaterals with the poor and the difficulties in contract enforcement in case of default. The poor credit discipline is also not conducive to aggressively expanding the outreach by banks. Due to extremely low incomes and non viable nature of their profession, there is always the risk of diversion of loan money if any emergency expenses have to be made leading to consequential repayment difficulties.

Lack of credit information

3.8.17.1.3 The formal agencies find it extremely difficult to obtain credit information about rural clients as they primarily rely on money lenders, traders and other informal lenders and it is most unlikely that they would be willing to part with any client information to formal agencies. The recent policy decision of the Reserve Bank of India regarding appointment of Credit Facilitators and Correspondents has the potential of becoming a useful arrangement to collect credit history/information regarding rural clients. The close relationship that is needed between the client and the rural branch is completely missing which is a serious constraint for the banks.

Branch Network

3.8.17.1.4 The branch network of the scheduled commercial banks in rural areas expanded quickly after the nationalization of the private sector banks. The rural offices
of the scheduled commercial banks increased from 1860 in 1969 to 35,396 in 1994 and thereafter declined continuously as shown in Table 8.

Source: Rural Economy – An Economic Times Intelligence Group Report and Trends and Progress of Banking in India 2004 - 05. *End June

The decline in the number of rural offices could perhaps be explained by [a] Liberalisation of branch licensing policy [April, 92]. [b] Freedom given to banks to relocate the branches etc. [c] Allowing the banks to exit on mutual consideration wherever they had loss making branches at rural centres served by two commercial banks [August, 93] and [d] Graduation of rural centres to semi-urban centres due to change in population etc. However, we need to keep in mind that the physical presence of a branch and personal interface with the branch staff are crucial psychological elements in rural banking in India where the literacy levels are low and technology use and awareness level even lower. Closing down of a large number of rural branches when the scheduled commercial banks had failed to achieve the agriculture lending/weaker section lending targets and the other institutions in the multi-agency approach i.e., the cooperative banks and RRBs had serious financial weaknesses, was perhaps not an appropriate strategy. Liberalisation in branch licensing policy could have been restricted to the banks which had achieved the rural lending targets.

3.8.17.1.5 The private sector banks which have a very small network of rural branches face serious problems in rural lending.

3.8.17.2.0 Problem of Access - Demand Side Issues

The collateral

3.8.17.2.1 Providing suitable collateral to the bank is the single most important constraint faced by the rural poor. Most of the rural poor have virtually no collateral which could be offered by them to secure their loans. Most of them may have only a
small plot of land which may not be easy to mortgage. Even the title documents may not be readily available. The entire process of registration of mortgage would be time consuming and expensive. Absence of collateral acceptable to the bank is a major hurdle for the rural poor in accessing credit from formal credit institutions. In spite of the instructions of the Reserve Bank of India, the RFAS-2003 referred to earlier, indicates that 87% of households who borrowed from RRBs and 89% households who borrowed from the commercial banks had to provide collateral for their loans. This means lack of collateral in practice leads to nearly financial exclusion as far as credit from banks is concerned. The informal agencies take recourse to more unorthodox approaches and are able to secure their loans and are to that extent more users friendly.

**Absence of Flexible Credit Products**

3.8.17.2.2 The formal credit institutions do not provide flexible products and services to meet the income and expenditure pattern of small borrowers in the rural areas. The rural poor need to borrow frequently as their wage income [which is a very large source of income even for the marginal farmers] in very irregular. They also have irregular expenditure pattern for which they are unable to borrow from formal sources. A major reason for the success of the SHG –Bank Linkage Programme has been the flexibility provided to the SHGs to decide the quantum of loan and the terms and conditions. The distinction between the consumption loan and production loan in the case of very poor is also rather blurred. The formal institutions lack flexibility and try to provide the rural poor, loans with terms which are not at all suitable to them as they do not match the income - expenditure pattern of the rural poor. The unit cost, period of loan, down payment, collateral etc. in many cases are standardized and decided on an all India basis/Regional basis leading to serious mismatch between what the borrower wants and could afford and what is offered to him. The result is that when an emergency expenditure has to be made, the rural poor find the moneylender, traders and relatives more dependable than the banks. The need is to develop different credit products innovatively at branch level to respond to farmers needs who have the requisite repayment capacity.
Documentation/Procedural Delays

3.8.17.2.3  Documentation and procedures for taking a loan [even for opening a saving bank account] are time consuming and cumbersome. Most of the rural poor do require the services of ‘other people’ [including some kind of middle men] to help in completion of the documents etc., which costs money. The RFAS-2003 referred to earlier revealed that loan approval took an average of 33 weeks in the case of the commercial banks. The survey also revealed that ‘hefty’ bribe amounts had to be paid by the borrowers and the sanction were often of smaller amounts than those applied by the borrowers as shown in Table 9.

Source: RFAS - 2003

*About 27% of those sample farmers who borrowed from RRBs/Commercial banks and about 10% who borrowed from the cooperatives paid bribes.

Distance of the Bank Branch

3.8.17.2.4  Another factor which adds to the cost of taking loan or the time spent in taking a loan from the banks is the distance from the village and the money/time required to be spent for each visit. According to the RFAS - 2003 [referred to earlier], the median distance to the nearest bank branch was 5 km. Keeping in view, the average time taken for a loan decision [28.5 weeks to 33 weeks in case of commercial banks and RRB respectively] it may result in at least 6 to 7 visits to the branch [one visit on a monthly basis and each visit would cost money] as against on the spot decision taken by informal agencies generally located in the village itself.
3.8.17.2.5 Sometimes these costs become so high that in spite of comparatively lower interest rates charged by the formal institutions, it works out more or less equal to the rate of interest charged by the informal agencies. A paper published in Economic and Political Weekly [14-20 August 2004] by Anita Gill based on experience in Punjab States as under: “Then there are additional costs involved like frequent visits to the bank, fee, submission of documents [which more often than not require payment for services to someone who can fill the forms of the illiterate farmers] etc. All expenses can be added up in the rate of interest and the institutional rate of interest then is almost at par with the informal rate of interest”. This aspect can not be ignored and reveals that the stipulated rate of interest on formal credit constitutes only a part of the total cost which a farmer incurs in taking a loan. The need is to reduce the total cost of the borrowers by simplification of loan procedures/documentation, reducing the sanction time and generally toning up the working of the branches. Extension of mobile banking facilities in certain far off areas, use of Facilitators and Correspondents etc. could also help.

3.8.17.2.6 It may also not be out of place to mention that for an average small/marginal farmer the banks appear to be mainly for the rural elite who are educated and could deal with the bank staff.

3.8.18.0 General Constraints in Agriculture Credit

High Risks in Agriculture Credit

3.8.18.1 The minimization of lending risks is important for the banking institutions. The risks emanate from a host of factors including failure of investment, inadequate returns due to production/ market risks, defaults due to inadequate/improper appraisal of loans, diversion of loans, poor follow up and inability to realize the securities available to the bank. These risks are common to all investments. However, in the case of agriculture credit, these risks are more pronounced, due to the sector itself and certain aspects of Indian agriculture. Any agriculture investment could be affected by weather induced risks more so in the Indian conditions where over 60% agriculture is rainfed. Similarly, the market risks are normal to any business enterprise, but in Indian conditions...
agriculture, the risks are accentuated due to extremely small size of holdings [weak bargaining power of the grower], absence of transparency in auctions at the Regulated Markets, distress sales, huge post harvest losses, lack of value addition, absence of a well established godown network, nascent Commodity Future’s market etc. Some of these risks could be minimized by financial products/arrangements like rain insurance, crop insurance, medical/accident insurance, and more effective implementation of the Minimum Support Price across the country, use of commodity future market etc. However, some of these instruments are yet to fully developed and adequately used in rural India. In absence of an effective risk mitigation system, the dryland farmers often become defaulter to the bank when the rains are not adequate and the yield declines. The defaulters are ineligible for fresh finance. NABARD had earlier tried ‘Cyclical Credit’ for the dryland agriculture. The need is to try the same approach with necessary modifications on a larger scale to test the idea and improve it so that it could be developed into a system of financing in these areas.

Weak Legal Framework and Constraints in Enforcement

3.8.18.2 The state of affairs regarding the land records, the difficulties in getting up to date information and registration of charge/mortgage etc. [land titling and registration system] and transfer of land are difficult under the present legal system which act as constraints to agricultural lending. The stringent tenancy laws which prohibit in some States tenancy arrangements or are very restrictive in nature has resulted in unrecorded and unofficial year to year oral lease practice [nearly 10.4 million hectare land forming about 8.2% of the total cultivated land was leased in 1991-92] which makes it nearly impossible for the tenant to raise formal credit on leased in land. The enforcement of contract by realizing moneys from execution of charged collateral is also extremely weak, time consuming and expensive.

Identification of Rural Credit with State

3.8.18.3 The Government’s domination of rural financial institutions, announcement of waivers, write offs, interference in recovery procedures, cap on interest rates, use of credit cooperative for Public Distribution System etc and even conversion or
reschedullement of loans in case of natural calamities are provided in such a manner as appearing to be induced by the State. All this has resulted in close identification of rural and agricultural credit with State. The State is seen by most rural people as ‘Mai Baap’ who are always to give rather than to take back given amounts leading to poor credit discipline in rural lending. The percentage recovery of dues against demand in the case of District Central Cooperative Banks [DCCBs] at the end of March during the last three years was quite low and ranged between 61 to 67%, in case of SCARDBs between 49 to 58%, in case of PCARDBs between 44 to 53% and for RRBs around 70%. The loan portfolio of RRBs is however different from that of the DCCBs/PCARDBs which mainly lend for agriculture purposes in rural areas.

**Personnel Policies of the Banks**

3.8.18.4 Manning of the rural branches is an issue. There is a shortage of staff. The right type of orientation is not there. The branch manager rarely lives in the village where the branch is located or even in the surrounding area. The banks find it difficult to find enough ‘volunteers’ to work in rural branches. Most of the officers have to undergo a fixed duration rural posting during which they get lower perks like housing and transport allowance leading to a lower carry home salary, while their expenses go up as most of them maintain two establishments; one in the city mainly for securing a better medical and schooling environment for their family members and the other for themselves. Inadequate staff is a definite constraint in developing ‘relationship banking’ which is at the core of all banking activities. One man rural branches or branches being run by 2-3 persons including a gun-man are not uncommon. It is somewhat encouraging to observe that the banks have now again decided to recruit agricultural graduates as was done in the Seventies and was later on given up in the late Eighties. These graduates with requisite knowledge and experience could provide needed support for expanding agriculture credit. **The need is for further relook at the personnel policies of the bank including the career aspirations and provision of incentives etc. to develop and retain adequate number of committed staff in agriculture credit related departments/divisions in the banks.**
3.8.18.5.0 Weaknesses of the Specialized Rural Credit Institutions

Cooperative Credit System

3.8.18.5.1 The promotion of the cooperatives credit system in the present day form was an attempt by the Government to institutionalize credit in the rural area. The cooperative credit system was designed to serve the rural population primarily for agriculture development. The area of operation and functions at each level of the structure were predefined and limited. It was service as the main concern rather the returns/profitability to the contributors of the capital funds. State partnership in credit cooperatives was introduced on the recommendation of the All Indian Rural Credit Survey Committee. Besides, the State Partnership, a very substantial part of their resources were from the Reserve Bank of India and later NABARD. There were few implications of these [a] these institutions did not pay adequate attention to mobilization of rural savings particularly at the Primary Cooperative Societies at the village level [b] they lacked professionalism in management and developed as a lending arm of the State rather than true cooperatives [c] the Registrar of the cooperative became all powerful and decided most of the matters. The autonomy of these structures was compromised. At the primary agriculture credit society level, the Government appointed Secretary virtually run these organizations and the elected office bearers [the board of directors] had very limited say. The interference with the functioning of the cooperative structures, sometimes led to compromising the norms for credit worthiness. In due course, political expediency also led to laxity in quality of credit and its repayments. The Government of India’s loan waiver scheme [1989] greatly aggravated the weak credit discipline and erosion in financial health. The State Governments have also been announcing waivers [sometimes interest wavier and some time partial loan write offs] which further undermines the credit discipline. Sometimes informal instructions are also conveyed to go slow on recovery [d] inadequate interest taken by the members who had only share capital with very low linkage with loan amount [e] since substantial part of the resources of the credit cooperatives were from RBI, the instructions were that this money had to be used for so called ‘productive purposes’. The lending became rather straight jacketed and amounted to mainly distribution of moneys received from the higher tier. Timeliness, adequacy and
members needs for loans became secondary. Generally the members of the credit cooperatives had to approach money lenders and other informal agencies for much of their credit requirements leading to repayment problems as the informal system with stiffer terms of sanction and more effective monitoring [day to day contact] were able to get priority in repayment. It is not an uncommon that the members of the cooperatives borrow eligible amount from the cooperatives and maintain account with moneylender, Commission Agent etc. for balance of credit needs [f] the credit societies were also used for Public Distribution Scheme which often provided negative margins.

Deteriorating Financial Health

3.8.18.5.2 The cumulative impact of political interference, write offs, poor credit discipline, lack of professionalism in management, heavy dependence on higher financing agency for resources, certain sectoral issues and operational constraints has resulted in most of the primary credit societies running into loss and the financial health of a large number of district central cooperative banks, State Cooperative Banks and the Agriculture and Rural Development Banking System has become very weak as shown in Table 10.

Impairment of Governance

3.8.18.5.3 Another important aspect is that in the case a very large number of cooperative institutions their elected Board of Directors is under supercession as shown in *Table 13*.

Incidentally, it is also not uncommon that change in political set up in a State leads to supercession of the elected Board as the cooperatives are also an important conduit of distributing political patronage.

**Higher Risk Profile of Credit Cooperatives**

3.8.18.5.4 The credit cooperatives are local financial institution, with the mandate of working in a limited geographical area and also with limited client groups and sectors. This adds to the overall risk profile of these institutions. A District Central Cooperative Bank [DCCB] or a Primary cooperative Agriculture and Rural Development Bank [PCARDB] is likely to have nearly entire lending for agriculture and may be for two/three specific crops or investment activities popular in that area. Any climate aberration or adverse market swing could land this bank into serious financial difficulties. Due to the high risk profile, these institutions need different dispensation. If these are also treated at par with Commercial banks [with nation wide area of operation and lending in different sectors] they may require recapitalization support at regular intervals. For example, nearly 85% of the resources of the long term cooperative credit structure [SCARDB/PCARDBs] are provided by NABARD as they are not fund based institutions [they can mobilize only term deposits from members]. However, the rate of interest charged by NABARD to these banks is the same which is charged to the nationalized banks with much lower risk profile, and a large resource base with lower average cost of funds. However, inspite of the problem of higher cost higher risk the PSCARDBs/SCARBs have to lend at more or less same interest rates as charged by the Commerce Banks. Obviously, many of these banks are non-viable and have also accumulated high NPAs as shown in Table 14 and Table 15.

While such high levels of NPAs and poor recovery position may not be justified, it should be carefully examined whether there is a need for a more diversified loan portfolio for these banks and also a different dispensation for resource raising including refinance from NABARD to these banks.

3.8.18.5.5 The financial impairment of the cooperative credit system has serious consequences for the rural poor/weaker section. The very fact that 144 District Central Cooperative Banks have eroded their net worth and do not comply with the requirements of section 11 of the Banking Regulation Act, 1965 [as applicable to the cooperative
societies] and their real net worth is not even Rs. 1 lakh makes them ineligible for NABARD refinance in the normal circumstances. Keeping in view that the cooperatives have the largest outreach among all formal and informal rural credit agencies in Maharashtra, Gujarat, Punjab, Haryana, Kerala, Madhya Pradesh and Chattisgarh their weak financial position and consequent reduction in lending has serious consequences in credit flow for agriculture. [Against a total membership of 13.541 crore at the Primary Agriculture Cooperative Societies level, nearly 31.38% [4.25 crore] belonged to scheduled castes/scheduled tribes]. **The deteriorating financial health of the cooperative banks has created a vaccume in agricultural credit flow in certain states/regions and it has also been very harsh for weaker section of the rural population.** Over time the share of the cooperative system in total lending for agriculture purposes has continuously declined as shown in **Table 16**.

*Source: Vaidyanathan Committee Report and Economic Survey 2005-06*

In just 12 years i.e., between 1992-93 and 2004-05, the share of cooperatives in total agriculture credit has come down from 62% to 25%. This is mainly due to deterioration in financial health of the cooperatives, their inability to mobilize more deposits and stagnation in support provided by NABARD to the Cooperative Banks as the General
Line of Credit [which was used for this purpose by NABARD] from the Reserve Bank of India is being phased out.

3.8.18.5.6 An impact of the impairment of deposits [total erosion of deposits of DCCBs were Rs. 3100 crore and the SCBs Rs 142 crore] is that deposits of members of the cooperatives and public are at risk. Incidentally, the deposits of one SCB and 15 DCCB have been fully eroded.

This problem was well analyzed by Vaidyanathan Committee which stated as under:

“Thirty eight percent of the deposits of the DCCBs were from the ‘cooperatives’ including Primary Agriculture Credit Societies [PACS]. As statutory liquidity ratio [SLR] requirements of the urban cooperative banks and other banking institutions in the area could be placed in the DCCS [and in turn DCCBs place their SLR deposits with the State Cooperative Bank [SCB]], the deposits under the head “Cooperatives” may have a significant component of SLR related deposits. This adds to the overall risks to the cooperative banking sector, taking to much beyond the exposure of individual deposits in the district and state level banks. Erosion in the deposits of DCCBs/SCBs, therefore, could have a ‘domino’ effect on the banking system in the area”.

Incidentally, the institutional deposits with higher tier are not covered by the insurance under the Deposit Insurance and Credit Guarantee Corporation of India [DICGC] and further even individual deposits are covered only upto Rs. 1 lakh. Further, deposits at the level of the Primary Agriculture Credit Societies [PACS] which as on 31st March, 2003 amounted to Rs 19,120 crore are not covered by the DICGC adding to the problem.

3.8.18.5.7 The multi agency approach in our country is a reflection of the need for different players in the field of agricultural credit. The refrain of all Committees and working groups which have looked into the performance of the cooperative credit system has been that the cooperatives have not done as well as they should have, but there is no question of getting away from the cooperatives in the long run. Experience reveals that the commercial banks have also shown some similar weakness in their rural lending operations that afflicted the cooperative system. **It may not be wrong to believe that**
some of the perceived weaknesses of the cooperatives are in fact not the weakness of the cooperatives but are associated with the clientele and the sector in which they operate. The problems of Indian agriculture do get reflected in the performance of the credit cooperatives as they primarily serve the agriculture sector. While the commercial banks have an important role in rural credit, in Indian conditions there is perhaps no alternative to the cooperatives at village level for provision of agriculture credit. The historic statement made in the All India Rural Credit Survey Committee Report in 1954 “the cooperatives have failed, but the cooperatives must succeed” perhaps holds well even today. **The need is to make a serious attempt to revitalise the cooperative system and devise strategies to ensure that these institutions work as autonomous/responsible bodies and in a very professional manner.** The NABARD/RBI would also have to introduce special dispensations for them to counter their design deficiencies. Unfortunately all support measures are sometimes wrongly described as concessions. **Need based support measures are essential to ensure that the specialised institutions are able to serve the less privileged people in the society.**

3.8.18.6.0 Regional Rural Banks [RRBs]

3.8.18.6.1 The Regional Rural Banks [RRBs] form an integral part of the Indian banking system with focus on serving the rural sector particularly the weaker section, i.e., the small and marginal farmers, agricultural labourers, artisans and small entrepreneurs for development of agriculture, trade and other productive activities. There are 196 RRBs operating in 26 States across 518 districts with a network of 14,446 branches [31-03-2004]. As per their organisation design, the RRBs combine the local feel and familiarity with rural problems, which the cooperative possess, and a degree of business organization as well as the ability to mobilize deposits, which the commercial banks possess. They are State-sponsored and partnered rural oriented commercial banks. These banks were expected to constitute a low cost banking system. The commercial banks not only contributed to their capital along with the union and the State Government but also provided crucial manpower and guidance. These banks were to be manned by rural based staff who were expected to be better suited to look after the needs of the rural population and also remain low cost. However, hopes of both low cost operations and
better attention to the needs of the rural population remained elusive mainly due to the unionized staff insisting on salaries comparable to commercial banks and the RRBs adopting ‘narrow banking’ and developed reluctance to lending. The investments in Government securities and banks had been exceeding the loan outstanding as shown in Table 17.

Table 17: Some Financial Indications of RRBs [as on 31st March]

Source: Trends and Progress of Banking 2005 * 26 March, 2004

The investments of the RRBs far exceeded their loans outstanding. As on 31st March 2005, the investments exceeded the loan outstanding by Rs. 13,294 crore [42%].

3.8.18.6.2 The outstanding agricultural loans of the RRBs increased from Rs. 10,261 crore at the end of March 2003 to Rs 16,710 crore by end March 2005. However, keeping in view their mandate, existence of 14,446 branches [which are nearly 45% of the total number of rural offices of scheduled commercial banks] and refinance facilities from NABARD, these banks need to focus more on loans to farmers and rural artisans etc. Their share in agriculture lending at about 10% is very small as compared to their branch network. With 167 out of 196 RRBs making current profits, the approach should quickly change from ‘narrow banking’ to a more aggressive lending based banking. With their rural based staff and a huge unmet demand for financial services in their operational areas these banks are yet to perform to their potential.

3.8.18.7 There is a need for clear visualisation of the expected developments in the field of rural credit and particularly agriculture credit and the role expected from the Reserve Bank of India, NABARD, different types of banks i.e., the commercial banks, RRBs and the cooperative banks in the next 10-20 years to give it a firm direction. Based on the above, there has to be a road map for strengthening/improving those credit agencies which are weak and require support for enabling them to perform as per the
future role decided for them. It is expected that these institutions would continue evolving to meet the constantly changing requirements of the sector and hence require a closer watch for orderly growth. Similarly there is also a need to decide our role expectations from the micro credit system. The Government of India and the Reserve Bank of India may take a lead in the matter.

**Regional Imbalance**

3.8.18.8 There are wide disparities in the disbursement of agriculture credit in different regions. Though these could be partly attributed to differences in credit requirements, absorption capacity of borrowers etc in different regions but the disparities are too large to be explained by the above. In the case of the Scheduled Commercial Banks, against an all India per capita credit of Rs. 128 [1996-2001], the per capita credit was very low in North Eastern region [Rs 17], Eastern Region [Rs 42] and Central Region [Rs 86]. The per capita credit in Southern Region [Rs 280] was the highest followed by Northern Region [Rs 153] and Western Region [Rs134]. The problem is compounded by the fact that the specialized rural credit institution i.e., the credit cooperatives are extremely weak in the North Eastern and the Eastern Region in particular. The long-term co-operative credit system [the SCARDBs and the PCARDBs] are virtually non-functioning in the entire North East Region and extremely weak in Bihar, Orissa, Jharkhand etc. Similarly the short term cooperative credit structure is also by and large in poor financial health in North East & Eastern Region. According to the Vaidyanathan Committee Report, forty three out of Sixty nine District Central Cooperative Banks in Eastern Region were loss making and thirty had NPA levels exceeding 40%. In the North East, the situation was worse as the percentage of recovery to demand at State Cooperative Bank Level on 30th June 2003 in the case of Arunachal Pradesh and Manipur was less than 20%, Assam and Nagaland between 20% and 30%, Tripura and Meghalaya between 30% and 40% and Mizoram about 48%. In a multi agency system, where one agency is weak, the others are expected to step in. However, the financially strong commercial banks including the public sector banks have failed to play this role. It is necessary that the credit policy should provide that where the localised institutions are weakened due to local problems,
greater risk profile or any other reason, the commercial banks must step in and shoulder greater responsibility in meeting the banking needs of the population.

19.0 Additional Suggestions - For Improving the Outreach and Agriculture Credit

Out Sourcing

3.8.19.1 One of the measures for improving outreach could be outsourcing. The Self Help Groups Linking with Banking System relied on outsourcing for credit decision making, monitoring and recovery of loans by the formal system to the informal system i.e., the Self Help Groups to reduce costs. Similarly the ‘Facilitators and Correspondents’ could be used by banks to reduce the costs and improve outreach. Similarly simplification of procedures and introduction of innovative schemes under which the poor could borrow and repay frequently as per their funds flow/position could be of help. Innovative arrangements need to be developed for collecting credit information regarding clients. There is a need to build up further on the SHG Bank Linkage Programme. The SHG members who are able to build up a good credit history and could use larger amount of credit may be identified and supported by the banking system. The SHGs are better suited to provide small credit for emergency needs or for tiding over temporary cash shortages but can not provide full financial services like the formal system. It would not be correct to expect the SHGs to substitute formal financial system; they can at best complement the formal system.

Land Leasing

3.8.19.2 Another aspect to be noted is that the small/marginal farmers are quite active in land lease market. In absence of supporting legal provisions they do not get adequate rent while leasing out land and are unable to raise credit on leased in land. Tenancy laws should encourage all sections of rural population to participate in the land lease market as per their needs. A well organised land lease market where leasing is logically permitted, would enable the small/marginal farmers and the land less who lease in land to raise loans from the formal agencies. Till such time, suitable amendments in land laws take
place, the banks need to finance oral lessees under joint liability groups and the State and Revenue authorities may give special support to the banks in recovering such dues.

**Insurance for Covering Risks**

3.8.19.3 An effective crop insurance system could minimize production risks. However, the present crop insurance under the National Agriculture Insurance Scheme [NAIS] is neither farmer friendly nor very effective. Certain changes in development of insurance as a financial risk mitigation arrangement are discussed subsequently. There is also a need for an integrated insurance cover for accident, natural death, medical and loss of hut by fire etc. The data given at para 14 shows that 13% and 7.23% of the outstanding debts of farmers owing less than 0.01 hectare and between 0.01 hectare to 0.40 hectare respectively were for medical purposes. In events of such needs, the farmers are quite likely to divert loan money and even default in payment if there were not financial products covering such emergencies or the rural public health system continued to be inefficient. In the first report of the National Commission on Farmers ‘Serving Farmers and Saving Farming’ has suggested a low cost Integrated Insurance Policy covering medical, accident, loss of dwelling unit, natural death etc. The proposal needs to be considered.

**Agriculture Risk Fund**

3.8.19.4 In event of successive droughts/floods etc the conversion /reschedulement of loans are not enough to provide adequate relief to the farmers. The successive loss of income would mean that the postponed debt burden plus the obligations for current loans would be beyond the capacity of the borrower to repay. The need therefore is for ‘relief’ by way of interest/principal write off which would need State support. An Agriculture Risk Fund with contribution from the Centre/State Government /Banks is needed to meet such situations. The bank could contribute say about 2% of the net profit [which could be given tax concession/exemption] towards the Fund on an annual basis. The localized financial institutions i.e., cooperatives/RRBs with limited geographical area, lack of diversification in lending and low volumes would require strong support from such a Fund to relieve the hardship of the farmers.
Fixing Proper Repayment Period

3.8.19.5 Fixation of shorter maturities than what is justified by increased income stream makes repayment difficult. Routinised fixation of repayment period instead of working out a mutually acceptable loan period based on carefully worked out future income flows could be the first step to check default in payment. The tendency on the part of the commercial banks to fix shorter maturities for loans is counter productive. As the commercial banks are constrained for long term resources, they should avail need based refinance from NABARD for long term funds or devise suitable systems under which longer end of maturities are held by institutions having large long term funds and commercial banks hold medium to short term maturities.

Credit Quality and Response to Development Needs

3.8.20 Agriculture credit quality could be significantly enhanced if the timeliness and adequacy is assured. The need is to fix realistic scale of finance for different crops and adjust it on a regular basis to take-care of the price changes and requirements of inputs based on new technologies and developments. Timeliness is crucial. Coverage of all agricultural borrowers by Kisan Credit Cards [KCC] with in a fixed time frame expeditiously is called for. Both in North East Region and hill areas, most of the agricultural operations are carried out by women farmers. However, there has been a general reluctance on the part of the banks to issue KCC to women farmers. This aspect needs to be examined. Even where land is in the name of the husband who has moved out of the village for job, the banks with proper documentation could issue KCC to the wife who is handling the agricultural operations. Further, the unit cost for different investments should be flexible and be used primarily as a general norm and not to be rigidly used irrespective of the need for higher amount of finance. The linkage between credit and marketing needs strengthening by increasing pledge finance, credit for marketing activities, developing storage facilities and lending against Warehouse Receipts. The banks need to explore the possibilities of providing loans to farmers against produce stored in their homes/godowns to minimise distress sale. ‘Contract Farming’ or other arrangements where the marketing risks are shifted to the processing
company or purchase of produce, facilitate flow of formal credit. The need is to develop farmer centric contract farming rules to encourage such developments. There has been remarkable growth of poultry and dairy in India. Development of commercial poultry/dairy farms requires bank credit. The banks need to meet credit requirements not only in traditional projects but also in new business enterprises for value addition/marketing which could create additional employment and provide linkages. It is expected that as the rural economy develops, there would be closer linkages between the farmers, trade intermediaries, food processing industry and the marketing units. These developments would need strong credit support. Farmers in dryland agriculture try to spread their risks by taking up different investments like animal husbandry, a micro non-farm activity and sometimes mix crop cultivation and horticulture etc. The banks need to look at their credit requirements differently and try to finance the basket of investments which would yield them a steady income.

3.8.21.0 Investment Credit – Crucial for Growth

3.8.21.1 Investment credit is used for realising long term potential of the agricultural farm by acquiring and using additional physical assets, improving the efficiency of existing assets [land improvement, land reclamation, using water lifting devices, water conservation devices etc.] and generating value addition etc. Long term investments in agriculture helps in improving the stock of equipments, tools and productivity of resources, which in turn enables the farmers to use their resources, particularly labour and capital more productively and realise the long term growth potential.

3.8.21.2 Though the long term credit has been increasing in absolute terms, as a percentage of total credit it has declined overtime. In 1999-00 the investment credit at Rs. 17,303 crore had formed 37.1% of the total institutional credit flow. Though the investment credit flow increased to Rs. 23,974 crore in 2002-03, it formed only 34.5% of the total. During 2004-05, the share of investment credit in the case of commercial banks was 27% where as in the cases of cooperative banks and RRBs it was only 16%.

3.8.21.3 The decline in growth of investment credit is mainly due to collapse/near collapse of the long term cooperative credit structure [SCLDBs and PCARDBs] in many
States like Maharashtra, Bihar, Orissa, the entire N.E. Region, Karnataka etc. The disbursements by this structure declined from Rs. 4776 crore in 2001-02 to Rs. 3956 crore in 2002-03. Further, as long term loans have to be invariably backed by mortgage of land etc., the need is for reduction of stamp duty and registration charges on mortgage, introduction of simple procedures for creation of charge, issuance of notification naming the Panchayat Headquarters for creation of equitable charge, improvement in availability of information regarding land records, etc. Land consolidation, more secure tenancy system, arrangement of long term leasing of water bodies would help in increasing investment credit. Strengthening of various development corporations such as State Irrigation Development Corporation, Forest Development Corporation and Agro Industries Development Corporations would also attract investment credit from banks for various development projects. The banks could also focus on providing group loans for tractors and other costly machines, development of water markets etc to avoid over capitalisation, encourage better use of capital assets and help in creation of employment opportunities in the form of encouraging youth to take up custom hiring etc. Development of rural infrastructure particularly roads, power, backward and forward linkages would also help in growth of term credit. High value agricultural activities require term credit support. **Bank could identify areas where farmers are moving towards high value agriculture and upgrade those branches by posting trained and technically qualified staff who could appraise such projects and commit necessary credit support.** Further, the marketing infrastructure, storages, cold chains, investments for value addition, agro-processing and agro-business are likely to be new investment areas in the years to come. The banks will be required to respond in a proactive manner to facilitate these developments.

3.8.21.4 There are also very large variations in per hectare average investment of term-credit between States. While for 2001-02 the per hectare average investment on all Indian basis was Rs. 456, in Orissa [Rs.205], Rajasthan [Rs. 324], Bihar and Jharkhand [Rs. 326], Chhattisgarh [Rs. 191], Maharashtra [Rs. 164], Jammu and Kashmir [Rs. 322] and in entire N.E. Region it was less than Rs 100. Increasing public sector investment in infrastructure, improving extension services, land records and land rights are some of the
issues which may require special focus for improvement considering the importance of increasing investments in agriculture for improving productivity. These States could also organise special studies to identify factors which could help in increasing investment credit flow. In the North-East Region, where land is owned by the Government or the community, the farmers are unable to offer land as collateral to the banks. This issue needs special attention and the banks and State Government need to reach a mutually acceptable arrangement in the matter.

**Insurance Support**

3.8.22 Insurance provides financial instruments to cover risks which are assessed in money terms. The National Agriculture Insurance Scheme [NAIS] was introduced from Rabi 1999-00 substituting the Comprehensive Crop Insurance Scheme [CCIS] which was operational between 1985 and 1999. Despite heavy subsidization by the Government [to the extent of nearly 75% of the scheme cost in the form of subsidizing the premium and meeting deficit cost] the coverage of NAIS has been hardly 10% of the Indian farmers. The National Agriculture Policy [2000] had stated “National Agriculture Insurance Scheme covering all farmers and all crops throughout the country with built in provision for insulating farmers from financial distress caused by natural disasters and making agriculture financially viable will be made more farmer specific and effective. Endeavour will be made to provide a package insurance policy for the farmers, right from sowing of the crop to post harvest operations including market fluctuation in the prices of agricultural produce”.

3.8.23 The NAIS, at present covers 23 states and 2 Union Territories. Between 1999 and 2003-04 Rabi, the NAIS had cumulatively covered nearly 4.62 crore farmers and provided relief to 1.58 crore farmers for an aggregate amount of Rs. 4752 crore against premium collection of Rs 1242 crore. About 75 million hectare of cultivated area was covered. Though the NAIS mainly covered the loanee farmers, the coverage of non-loanee farmers was increasing. Incidentally, the claim experience of non-loanee farmers till 2003-04 was about three times higher than the loanee farmers which was rather unusual and needed to be looked at closely.
3.8.24 Under the NAIS, the loss assessment is based on an area approach, the ‘Threshold Yield’ and ‘level of indemnity’. The Threshold Yield [TY] is the moving average yield based on past three years in case of rice and wheat as past three years and last five years in case of other crops. The unit area for assessing the actual yield has been Block/Taluka and the indemnity levels fixed at 90%, 80% and 60% for the compensation under the scheme based on crop cutting experiments. The Scheme also provided a 50% subsidy in premium to be paid by the small/marginal farmers [shared equally by the Government of India and the State Governments] which is to be phased out in a period of five years.

3.8.25 The main criticism of NAIS has been on following grounds:

- Large insurance unit [Taluka/Block] not reflecting individual farmers yield experience
- Guaranteed yield based on last 3 to 5 years needed change particularly in areas where last few years have not been good.
- Inordinate delay [6 months to 12 months] for settlement of claims.
- Insurance coverage not available for all crops notably fruits/vegetables.
- Loss of farmers where the sowing does not take place not covered.
- Indemnity level of 60% is very low and needs to be increased.

3.8.26 On directions of the Hon’ble Prime Minister, the Ministry of Agriculture, Government of India appointed a Joint Group of to study the improvements required in the crop insurance programme in August, 2004. The Group submitted its Report in December 2004. However, the Hon’ble Union Finance Minister during his budget speech declared that the NAIS would be continued in its present form for Kharif and Rabi 2006 - 07.

3.8.27 The Situation Assessment Survey of Farmers done by NSSO [NSS Report No 496: Some Aspects of Farming-2003] revealed that at the all India level, only 4% farmer households reported ever having insured their crop. Among those who had never insured their crop, a very large percentage [57%] were unaware of the practice of crop insurance. Out of the remaining 43%, as many as 16% were not interested, 24% said that the facility
was not available to them and 3% said that they could not pay the premium. Lack of awareness and interest of such a large percentage of the population in a Scheme, which is in operation for nearly 20 years [in one form or the other], is a sad commentary on the developmental/promotional efforts made and also the user’s perception about the usefulness of the Scheme.

3.8.28 Besides the need to make the NAIS more user friendly, by eventually making it individual based and reducing the time in settlement of claims it would also be useful to experiment with ‘Weather Insurance’[Rain Insurance] at a larger scale. Instead of using the crop cutting experiments to assess the actual yield, serious thought needs to be given to using ‘Surveyors’ for loss assessment. Let us not forget that the claims under cattle insurance, tractor, poultry and certain horticulture crops is settled on the basis of assessment of damage/loss made by the surveyors. It would be worthwhile to make an attempt. The National Agriculture Insurance Company [NAIC] could consider opening one/two men district offices who could have a number of surveyors as retainers and could be allotted the work as per the claims etc. Till such time, the NAIS switches over to individual basis as indicated above, the unit area may at least be reduced to ‘Gram Panchayat. Further, the delays in settlement of claims [6 - 12 months] defeat to a certain extent the very purpose of insurance. So long as the settlement of claims is continued to be based on crop cutting experiments, prompt settlement of claims is difficult to achieve.

3.8.29 It is also worth considering whether the NAIC may continue as a ‘one risk’ insurance company or be encouraged to grow into an organization to meet various insurance requirements [other that the life insurance] in the rural areas. A more diversified insurance portfolio would help in reducing the risk, increasing volume of business, improve its visibility and help in developing rural insurance as a financial product. It may also be worthwhile to allocate about Rs. 100 crore to NAIC as Rural Insurance Development Fund to take up promotional and developmental work regarding rural insurance.
CHAPTER 3.9
GUIDING PRINCIPLES UNDERLYING THE DRAFT
NATIONAL POLICY FOR FARMERS

MARKET*

3.9.1 An efficient marketing system is essential for the development of the agriculture sector, providing incentives to the farmers for commercialization, increasing production and giving appropriate signals for production planning and research activities. At the time of independence, there was shortage of production against demand and the immediate concern was to save the farmers and consumers from the malpractices of traders and facilitate growth and development of an orderly marketing arrangement. Some of the characteristic features of the agriculture produce marketing in India at the time were [a] sales immediately after harvest mainly for meeting the cash needs—mostly distress sale at discounted prices, sale of upgraded produce, loose carrying of produce [b] predominant role of village trader and interlocking of credit and commodity market [c] use of unstandardised weights measures by traders and high market charges which included charges like ‘mudat’, ‘dharamda’, ‘arahat’ etc. [d] direct sale by farmers and absence of farmer’s organisation to reach volumes and protect the interest of the small producers. In view of the above circumstances, the Government developed organised marketing of agricultural produce through the regulated markets. The States and the Union Territories passed the APMC Act. A massive programme for creation of marketing network was taken up. As on 31 March, 2004, as many as 7418 markets had been brought under the ambit of regulated markets. In addition, out of 27,294 rural periodic markets [village haats, shanties etc.], nearly 15% function under the regulated framework. The basic

objective of setting up the above network of markets was to protect the interest of the farmers and eliminate various malpractices of the traders.

3.9.2 In view of the serious supply side constraints, apart from market regulatory programme, various legal enactments were also promulgated and orders covering specific products issued by the Government. These included the Essential Commodities Act, 1955, Standards of Weights and Measurement Act, 1976, Prevention of Black Marketing and Maintenance of Supply of Essential Commodities Act, 1980, Agriculture Produce [Grading and Marketing] Act, 1986 and Consumer Protection Act 1986 and Bureau of Indian Standards Act, 1986. In addition, there were also specific orders covering various products like meat, vegetable oils, milk and milk products, fruit and fruit products, pulses, edible oil seeds, edible oil, solvent extracted oil, deoiled meals etc. The recourse to the provision under these orders etc. is mainly intended to be taken during periods of scarcity and stop the malpractices. Some of these orders also covered activities like storing, packing, quality, blending, processing etc.

3.9.3 The regulated markets achieved certain amount of success in providing transparent transactional methods/marketing practices, basic amenities and services conducive to an efficient marketing system. Some of the developments in the marketing system at the primary market level and farmers marketing practices are [a] the marketed surplus per farm has grown up. The overall marketed surplus-output ratio is estimated to have improved from 13% in 1950-51 to 64.1% in 1999-2000 [b] there has been some standardization of market charges resulting in their reduction and the liability has generally shifted to the buyers [c] the quality of market information available is much better than what it was during the ‘fifties’ and the ‘sixties’ [d] the market sales have increased [e] there are sectors where the sales through the cooperatives are substantial [f] inspite of the restrictive features, the system has made space for ‘contract farming/direct marketing/other innovative practices like the ITC’s e-chaupal etc.

3.9.4 Inspite of the development of the regulated agricultural produce marketing system, several weaknesses such as distress sales immediately after harvest, absence of grading and packaging at the farm level, inter-locking of credit and markets continued.
Further, the Regulated Marketing System did not offer the farmers virtually any option/choices; the farmers also complain about lack of transparency in weighing and auctions, considerable delay in effecting sales, unauthorized deductions and poor treatment given to them at the market yards. The other weaknesses of the system are [a] poor spread of regulated markets in certain States [b] inadequate development of the rural periodic markets which are the first contact point for the growers [c] inadequate infrastructural facilities at the regulated markets [d] large variations in the market fee/charges across districts/States [e] failure to develop common trade language and [f] inefficient working environment, etc.

3.9.5 A recent study done by the Karnataka State Agriculture Prices Commission [2002] in respect of 3408 farmers revealed that only about 29% of the sample farmers sold their produce through the regulated markets. The remaining 71% farmers not using the regulated markets cited distance [31.2%], good price at the local market [18.4%], small quantity [12.7%], advance already taken [9%], no knowledge about the regulated market [8%], delay in payment [7.8%], no provision of paddy sales [5.4%], cheating in weighment/removing 4-5 kgs of the produce and harassment by Hamals/ Coolies [3.1%], long wait for weighing [1.4%], others [3%]. The above findings clearly reflect that the majority of farmers do not sell their produce at the regulated markets. These markets are neither farmer friendly nor there has been adequate effort on the part of the regulated markets to attract the farmers and build the business.

3.9.6 The Government monopoly in setting up agriculture produce markets under the State specific Acts [Agriculture Produce Markets Committee Act] has prevented the private sector from taking initiatives in development of agricultural marketing. Further, the lack of competition and the regulatory focus under the APMC Act has meant that these organisations have played little role in development of markets or encouraging grading processing, value addition at the farmer’s level. For improving the management of existing regulated markets and making them farmer friendly, holding of regular elections of the marketing committees and State Agricultural Marketing Boards/ SAMBs should be made mandatory and the emphasis should be on promotion of grading, binding and packaging of farm products and promoting new markets for the local products. The
system of issue of licenses for trading and functioning in the regulated markets needs to be changed to counter the oligoponistic powers of established traders and other ‘market functionaries.’

3.9.7 As regards the Essential Commodity Act, 1955 and other Acts/orders etc., the Task Force on Employment Opportunities [Planning Commission] had observed ‘The Essential Commodities Act is a Central Legislation which provides umbrella under which the States are enabled to impose all kinds of restrictions on storage, transport, processing of agricultural produce. These controls were traditionally justified on the ground they were necessary to control hoarding and other type of speculative activity, but the fact is that they do not work in time of genuine scarcity and they are not needed in normal times. Besides, they are typically misused by lower level of administration and become an instrument of harassment and corruption.’ Some of the other Acts/orders [some of which are mentioned in paragraph [2] also need a revisit in view of the changed circumstances.

3.9.8 The farmer wants different options for marketing his produce. The State APMC Acts need to be amended to provide for among others, encouraging the private sector or cooperatives to establish markets, develop marketing infrastructure and supporting services, collect charges, allowing marketing without the necessity of going through APMC/licensed traders etc.

3.9.9 The supply chain in agricultural marketing is long and has increased the margin between the price received by the farmer and the price paid by the consumer. Tightening of the supply chain is called for and the role of the farmer’s organisations [cooperatives/Self Help Groups] needs to be expanded. To begin with these organisations could aggregate the farmer’s produce and improve post harvest handling. Direct marketing by farmers needs encouragement by providing them opportunities for direct sale to consumers in the regulated markets and also by developing special markets/bazaars for the purpose. Sale of graded produce could fetch better price to the farmer, reduce the time taken in effecting sale at the Market Yard and lead to greater transparency in auctions etc. There is a need for fixing quality standards for all
agricultural commodities and introducing compulsory grading for sale in the regulated market in a phased manner.

3.9.10 ‘Contract Farming’ eliminates market risks for the farmer and could encourage diversification and commercialization of agriculture. However, it is necessary to develop farmer centric ‘Code of Conduct’ for contract farming and also building effective farmer’s groups/organisations to negotiate with the purchasers to help in orderly development of these arrangements and protect farmer’s interest.

3.9.11 Distress sale by small and marginal farmers at discounted prices for immediate cash continues to be a serious problem which could be countered to some extent by liberalising pledge loans against produce stored in godowns/farmer’s own home. There is need for considerable expansion of storage [including cold storage] facilities, improving warehousing system, facilitating loans against Warehouse Receipts and generally making Commodity Futures Markets more useful to the farmers.

3.9.12 Farmers all over the country consider ‘market’ as the most crucial aspect in the entire agricultural operations which impact their income and welfare as also a major constraint for further diversification and commercialization. They want much greater support from the State in getting reasonable prices for their produce. Many farmers are not satisfied with the level of Minimum Support Prices and believe that these have not kept pace with the increase in prices of inputs and the prices of other products. The Minimum Support Price [MSP] needs protection across different regions of the country. In absence of procurement operations all over the country, the benefits of MSP are mainly limited to Punjab, Haryana, U.P. and to some extent A.P. The prices of crops covered under the MSP remain below the MSP level in many parts of the country particularly after the harvest. Further, the prices of sensitive commodities [not covered by MSP] have to be watched particularly during glut period for quick intervention under an effective Market Intervention Scheme.

3.9.13 Farmers require authentic information based on meteorological, marketing and management information for land use decisions/investments etc. The need for such
advice would become more acute in future with new growth areas of agriculture being characterised by greater heterogeneity, unlike traditional crop cultivation etc. The production may be highly concentrated and markets could be quite different from the present. For rendering advice to the farmers the Government could restructure the Land Use Boards supported by team of technical experts/agencies etc. Besides promoting diversification, there is need for value addition in agricultural production for increasing incomes and rural employment. Post harvest losses are a serious drain on farmer’s income and need attention.

3.9.14 There is a need for early consideration of the proposal made in the Third Report of the National Commission on Farmers [Serving Farmers and Saving Farming - 2006: Year of Agricultural Revival] for establishing an Indian Trade Organisation [ITO] and our own boxes for domestic agricultural support on the models of the WTO’s Blue, Green and Amber boxes. We need to segregate the support extended to farmers into two groups - those which are of the nature of life and livelihood support to small farm families and those which could be considered as trade distorting in the international market. The first group of support measures needs to be strengthened for protecting the food and livelihood security of our farmers.

3.9.15 The Union Ministry of Agriculture have already initiated the reform process in agricultural marketing. The Ministry has been proactive and has circulated a draft for the revised APMC Act to all the States. The State Governments will have to undertake such reforms speedily in order to remove bottlenecks and scope for corruption and harassment. Both quality and trade literacy programmes should be initiated all over the country. In relation to commodities, which are exported, it will be essential to conform to WTO Regulations. At present, such commodities constitute about 7% of total agricultural production in the country. Farmers’ Associations and SHGs should be helped to export on competitive terms by spreading awareness of the opportunities available for external agricultural trade. In such cases, cost, quality and reliability of supply will determine long term trade relationships. The agri-export zones should be further strengthened and should become places where farmers will get the best possible price for their produce. The establishment of Community Grain and Food Banks could
help in the marketing of underutilized crops. Indian farmers can produce a wide range of health foods and herbal medicines and market them under strict quality control and certification procedures.

3.9.16 Internal trade in India faces many problems due to the diversity of controls exercised by multiple authorities at different levels, restrictions of inter-state and inter-district movement of goods, lack of uniformity of standards laid down by different authorities and agencies and in taxes. All this has led to breaking up of the vast Indian Market into a large number of smaller regional markets to the detriment of the farmer. The Hon’ble Prime Minister of India, Dr. Man Mohan Singh in his address at the Agriculture Summit-2005 observed as under, “An important commitment of our Government is to integrate the domestic market to all goods and services. The time has come for us to consider the entire country as common or single market for agricultural products. We have to systematically remove all controls and restrictions, we should enable direct marketing between farmers and NGOs, Cooperatives and Private Companies.”

3.9.17 The paper work involved in complying with various controls, regulations and licenses, the costs involved in terms of time and resources and the inevitable corruption and malpractices that this leads to, have served as a big drag on the efficiency of trading operations in the country. All these costs are ultimately passed on to the producer and the consumer. The barriers to internal trade could be grouped into [a] restrictions imposed by the Essential Commodities Act, 1955/Prevention of Food Adulteration Act, 1954 and other legal enactments and orders [b] fiscal issues [c] transport issues and [d] agriculture trade related issues.

3.9.18 While India is nearly a ‘Common Market’ as there are no customs duties and no quantitative restriction in movement of goods from one State to another however, many steps particularly in the matters relating to transport [replacing annual road tax and removal of fitness certificate by a life time payment/system, introducing a National Permit for plying commercial vehicle anywhere in India etc.], fiscal matters [introduction of State VAT, uniformity in taxes on commodities, withdrawal of Octroi and local taxes],
tax administration [avoid using the border posts for collection/verification of payment of taxes], agriculture trade related issues [amendment to APMC Act to allow private parties/cooperatives to establish markets and relook on various Acts/orders leading to some very restrictive features in matters concerning movement, storing, stocking, processing of agriculture produce] are some of the further steps needed for making India a ‘Single Market’. The above changes would need building a consensus/constant persuasion and sharing/compensation for loss of revenues to the State Governments. The financial matters including loss of revenues for the States could be a major issue in moving towards a Single Indian Market. This could be referred to the Finance Commission for suggesting methods, allocations etc. by which the Indian Single Market may become a win-win situation for all.

3.9.19  Until recently, Indian agriculture was described as a gamble in the monsoon. Now, it is also becoming a gamble in the market. Market security is becoming vital for further agricultural progress. Hence, steps to bring about a Single Indian Market have become urgent.
CHAPTER 4

TOWARDS A BIOSECURE AGRICULTURE

4.1.0 A National Agricultural Biosecurity System: An Urgent Necessity

4.1.1 Our national preparedness and capability in the area of Biosecurity are currently issues of widespread debate following the detection of the H5N1 strain of avian influenza virus in a few pockets in Maharashtra and Gujarat. Biosecurity has wider implications in biological warfare and bio-terrorism. This area is obviously a matter of serious concern to the National Security Council. In our country, agricultural Biosecurity covering crops, trees, and farm and aquatic animals is of even greater importance since it relates to the livelihood security of nearly 70 per cent of the population, and the food, health, and trade security of the nation.

4.1.2 The world is truly becoming a global village with reference to communication and transport. Disease causing organisms can spread fast through aeroplanes and farm trade. India is the transitory home for many migratory birds. Our country is also becoming a national village with reference to communication, transportation, and trade. Therefore, home quarantine assumes as much importance as international quarantine. Cross-border movement of farm goods and animals with neighbouring countries is another area of Biosecurity significance.

4.1.3 The National Commission on Farmers (NCF) is concerned with the impact of invasive alien species on the livelihood security of farm women and men. Therefore, it stressed in its very first report submitted in December 2004, the need for a thorough review of the present infrastructure and institutional framework in the area of agricultural Biosecurity, including the World Trade Organisation specifications of sanitary and phytosanitary measures.

4.1.4 The National Bureau of Plant Genetic Resources has been intercepting many alien invasive pests in imported agricultural commodities. There is also the threat of new
strains of wheat rusts. Hence, the NCF has been holding consultations on developing a National Agricultural Biosecurity System characterised by high professional, public, and political credibility. The major conclusion is that we urgently need a National Agricultural Biosecurity System with the following principal goals:

(a) To safeguard the income and livelihood security of farm and fisher families as well as the food, health, and trade security of the nation. This through effective and integrated surveillance, vigilance, prevention, and control mechanisms designed to protect the productivity and safety of crops, farm animals, fish, and forest trees.

(b) To enhance national and local level capacity in initiating proactive measures in the areas of monitoring, early warning, education, research, and international cooperation. And, to introduce an integrated Biosecurity package comprising regulatory measures, education, and social mobilisation.

(c) To organise a coordinated National Agricultural Biosecurity Programme on a hub and spokes model with effective home and regional quarantine facilities. This should be capable of insulating the major agro-ecological and farming zones of the country from invasive alien species of pests, pathogens, and weeds.

4.2.0 Scope of Biosecurity

4.2.1 Biosecurity is a strategic and integrated approach that encompasses the policy and regulatory frameworks (including instruments and activities) that analyse and manage risks in the sectors of food safety, animal life and health, and plant life and health, including associated environmental risk. Biosecurity covers the introduction of plant pests, animal pests and diseases, and zoonoses, the introduction and release of genetically modified organisms (GMOs) and their products, and the introduction and management of invasive alien species and genotypes. Biosecurity is a holistic concept of direct relevance to the sustainability of agriculture, food safety, and the protection of the environment, including biodiversity.
4.2.2 Biosecurity is a process of managing biological risks associated with food and agriculture in a holistic manner. Besides enhanced productivity, sustainability and profitability, interest in Biosecurity is increasing as national regulatory and export certification systems are being challenged by large increases in the volume of food and agricultural products being traded internationally, by the expanding variety of imported products and by the growing number of countries from which these imports are originating. Increased travel is also creating more pathways to spread pests, diseases and other hazards that are moving faster and farther than ever before. Improved coordination is being sought among national bodies responsible for enforcing sanitary, phytosanitary and zoosanitary measures to better protect human, animal and plant life and health without creating unnecessary technical barriers to trade.

4.2.3 The strengthening of policy and regulatory frameworks for Biosecurity in food and agriculture must be among the highest priorities. These policy and legislative frameworks need to be extended to include biosafety needs within the overall framework of Biosecurity. This will provide: (i) optimization of scarce human and financial resources, (ii) improving the cohesiveness of advice on all aspects of Biosecurity, including biosafety, (iii) recognition of the special importance of biosafety to food and agriculture as well as the special impacts of food and agriculture on biosafety. Further, this will seek the development of appropriate standards, guidelines, and other recommendations for food safety and the protection of plant, animal and aquatic life and health based on risk assessment and taking into account relevant aspects of biosafety, including environmental health.

4.2.4 Thus, risk analysis and management as a framework for Biosecurity becomes the central binding force across various sectors. It provides an opportunity to harmonize terminology and methodology, while respecting the need for individual sectors to tailor risk analysis procedures to the characteristics of the risks involved. It should be recognized that risk analysis procedures should provide an appropriate science-based and transparent basis for Biosecurity. Fast expanding trade has intensified the need for effective risk analysis capacities and for bilaterally and multilaterally agreed standards.
4.2.5 There are several commonalities in risk assessment and management across the subsectors and organisms which must ideally be addressed by the National Agricultural Biosecurity System. And, in time to come, since Risk Analysis and Management will constitute bulk of the animal, plant, fish health management, Biosecurity would automatically occupy the centre stage in this field.

4.2.6 The various international standards issued through several international conventions and agreements notwithstanding, in the wake of implementation of WTO-SPS Agreement and to meet TRIPS and TBT, the country is required to undertake following actions:

i. Designating a single Central Government authority as responsible for implementation of SPS measures.
ii. Reviewing and updating of legislation and regulations related to SPS to give effect to international agreement and establishing a nodal point for enquiries and information exchange,
iii. Establishing national standards on SPS measures in line with international standards,
iv. Establishing a notification procedure,
v. Undertaking pest risk analysis and identifying and maintaining pest-free areas for plants and animals as per international standards and safety assessment for food,
vi. Providing scientific justification of high level protection in the absence of pest risk assessment,
vii. Recognising of equivalence of specific measures through bilateral or multilateral agreements,
viii. Identifying researchable issues and strengthening back-up research,
ix. Capacity building in terms of infrastructure and expertise,
x. Awareness building and catalyzing attitude change, and
xi. Developing functional public-private-NGO partnerships.

4.2.7 Requirements of several of the other international, regional and bilateral agreements and of national regulations on various agricultural commodities and ago-
ecological and socio-economic regimes, whether on plants or animals or fisheries or microbes, are analogous. Establishing and operationalising separate facilities for each of the requirements amounts to not only gross duplication of scarce resources and efforts but also erosion of effectiveness, efficacy and synergy which are essential for achieving sustainable, sound and competitive outcomes. A National Agricultural Biosecurity System, which involves the management of biological risks in a comprehensive and synergistic manner, is a strong force of convergence of the various paths of sustainable development – a win-win situation for all partners of development.

4.3.0 Status and Prospects of the National System

4.3.1 India has been striving to become a Biosecure nation. But our facilities for sanitary, phytosanitary and zoosanitary measures are inadequate. The Avian Flu menace notwithstanding, India’s consignments of farm exports are rejected in hundreds (often being on the top of the list of rejections) every year on grounds of mycotoxin, salmonella, pesticide residues, etc. The situation is likely to worsen in the coming years since health safety standards as presented by Codex Alimentarius are getting increasingly stringent and the goalposts in developed countries have been shifting fast. Food safety standards will become the most important non-tariff barrier. Therefore, we must not lose any further time in rendering India Biosecure, both from within and outside. A quality food safety and Biosecurity literacy campaign must be launched at all levels – from farmers to policy makers.

4.3.2 Our Biosecurity infrastructure needs to be vastly strengthened. As regards plants, according to the National Bureau of Plant Genetic Resources (NBPGR), several invasive alien species have been introduced into the country along with grain, seed and planting material imports. These introduced pests include bunchy top of banana, banana bract and streak viruses, vegetable/pea leaf miner, spiraling white fly, American serpentine leaf miner, peanut stripe virus, cotton leaf curl, potato wart, sunflower downy mildew, coffee pod borer, apple San. Jose scale, Biotype B of white fly and invasive weeds like *Lantana camara* and *Phalaris minor*. Six of these were introduced in 1990s. With the increasing intensification of agricultural production, productivity and trade, such
invasive alien species will further threaten our crops. A new wheat stem rust pathotype Ug 99 is causing serious damage in Uganda, Kenya and a few other countries, and threatens to reach India. Wheat being our main pillar of national food security and rural economy, India must take proactive steps to prevent entry and establishment of this race in India (see Box I).

**Box I. Sounding the Alarm on Global Stem Rust**

Stem rust is a catastrophic disease because of its ability to cause complete annihilation of wheat crops over wide areas. The widespread use of PBW 343 wheat variety possessing 1BL.1RS translocation with \( Sr31 \) and its continuing stem rust protection over about 6 million ha in India alone had led to complacency throughout the wheat community. The discovery of race Ug99 with virulence for \( Sr31 \) and other important genes in Uganda in 1999, and possibly earlier in Kenya, was a reminder of the pathogen’s ability to respond, but little seems to have happened in breeding programs until the emergence of current concerns following the continued incidence and spread of race Ug99 in Eastern Africa. The prospect of a stem rust epidemic in wheat in Africa, Asia and the Americas is real and must be stopped before it causes untold damage and human suffering. Fortunately, resistant sources against Ug 99 have been identified and the desirable agronomic bases are being used for developing resistant strains in collaboration with Kenya and CIMMYT.

Another disease of wheat that can be very important is Blast on wheat. This strain of blast was first found in Brazil and is now spread up to Bolivia. Very little is known about its likely effect to wheat crop in rice-wheat belt of India. If germplasm enhancement is initiated now (obviously selection will have to be done in Brazil or Bolivia), perhaps by the time diseases reaches India we may have resistant cultivars.

An Expert panel on “Global Rust Initiative”, 2005 recommended that diverse genetic resistance be identified in global wheat germplasm by testing in Kenya and Ethiopia. Because modern cultivars currently grown in Northern Africa and Asia are susceptible to race Ug99, a breeding strategy be implemented to incorporate diverse genetic resistance to Ug99 into such germplasm before the race migrates to those areas. DNA-marker assisted selection should be utilized where feasible. The seed multiplication agencies and community-based organizations be encouraged to produce commercial seed of newly developed stem rust resistant varieties with stipulations that (1) farmers and other stakeholders play a leading role; (2) breeding programmes be supported in the maintenance and multiplication of Breeder’s and Foundation seed; (3) commercial seed be readily available to farmers; and (4) on-farm demonstrations of elite varieties be conducted. The ex-ante and ex-post impact assessments should be undertaken, taking into account alternative crops and livelihood systems.

*Source: Various CIMMYT Publications, and R.P. singh of CIMMYT (personal communication).*

4.3.3 Five major quarantine stations at New Delhi, Mumbai, Kolkata, Chennai and Amritsar have been modernized with sophisticated equipment and Post Entry Quarantine facilities under a UNDP/FAO project. However, there are other 24 plant quarantine
stations for the upgrading of which an initial effort has been made for need assessment in terms of laboratory and green house facilities required under a FAO-TCP proposal. The 24 stations were classified into three broad categories in the said project based on nature and volume of material received in each of the stations. The output of the project can be a starting point to initiate upgrading of these stations. It may however, be noted that apart from equipping these stations with modern instruments and facilities, the means of communication (telephone, fax, e-mail, vehicle) need special attention for efficient functioning of these stations.

4.3.4 The establishment of national standards on sanitary and phytosanitary measures in line with the international standards is of critical concern to meet the stiff challenges under the international agreements. During 1995 to 2005, 24 international standards have been developed (see Box II). During the past 15 years or so, India has developed the following eight National Standards, some of which conform to some of the International Standards but a lot more work is needed in this direction:

- National Standard for Pest Risk Analysis.
- Guidelines for certification of forced hot-air treatment facilities for wood packaging material.
- Quarantine treatments and application procedures: I. methyl bromide fumigation.
- Guidelines for assessment, audit and accreditation of fumination agencies for undertaking methyl bromide fumigation.
- Requirements for establishment of pest free areas for mango nut (seed) weevil (*Sternochaeus mangiferae*) and pulp weevil (*S. frigidus*).
- Requirement for establishment of pest free areas for tephritid fruit flies.
- Guidelines on certification of hot water immersion treatment facilities for mango fruits.
- Accreditation treatment for ISPM-15 Compliance.

The National Agricultural Biosecurity System may constitute a National Committee on SPS Standards and a suitable standard setting procedure needs to be developed and adapted at the Central and State levels.

Source: Interim Commission on Phytosanitary Measures

So far no systematic efforts are being made for survey and surveillance of endemic pests, of new and emerging pests and of the exotic pests which have been introduced and are spreading. An effective integrated pest surveillance system and
organization devoted to performing field inspection and pest survey activities for the detection, delimitation or monitoring of established pests as well as system and organization devoted to the detection of new pests needs to be introduced. Specific systems may be required for identification, establishment and maintenance of pest-free areas as per the international standards. Similarly, systematically designed survey, surveillance and monitoring studies for the toxin incidence in food and agricultural commodities are required to identify less risk-prone areas for export and domestic use. For this, need-based additional support is needed to strengthen containment facilities, pest risk analysis capacity, pest diagnostic laboratories, residue and toxic laboratories, referral laboratories, emergency control and treatment facilities and accreditation laboratories.

4.3.6 In fisheries and aquaculture, alien species and genotypes (also known as introduced species and genetically altered species) both have a major role in increasing production. They are recognized as one of the most significant threats to natural aquatic ecosystems, and thus to those who depend upon them.

4.3.7 Alien species are a valid means to improve production and the economic benefit from fisheries and aquaculture. About 17% of the world’s finfish production comes from alien species. Asia produces more of the African cichlid tilapia (>700 000 t) than Africa itself (39 245 t). In Chile, introduced salmonids provide about 20% of the world’s farmed salmon, in an industry directly employing some 30 000 people.

4.3.8 The issue is neither to ban alien species, nor to abandon regulation of their movement, but to assess the risks and benefits associated with their use and, if appropriate, develop and implement plans for their responsible use. A lack of adequate information is often a major constraint: without such information it is difficult to determine the possible impact of a proposed introduction into a complex and dynamic aquatic ecosystem.
4.3.9 Internationally recognized treaties have recently been established to address the issue, calling for accurate assessments of the risks of introducing exotic species, and promoting the creation of information sources and exchange of information on exotic species, including their biological and ecological attributes, and possible positive and negative impacts. These include the FAO Code of Conduct for Responsible Fisheries, and CBD Article 8h and decision V/8 on “alien species that threaten ecosystems, habitats or species”. The International Council for the Exploration of the Seas (ICES) and the European Inland Fisheries Advisory Commission (EIFAC) have both created specific guidelines and procedures for dealing with alien species and GMOs.

4.3.10 As regards aquatic life forms, surprisingly, there are no quarantine facilities in this huge country of tremendous aquatic resources. A National Strategic Plan for Aquatic Exotics and Quarantine has been prepared. It addresses the following key issues:

(i) Risk of introducing exotic species;
(ii) Criteria to finalise list of potential, approved and prohibited exotic species and criteria to finalise diseases of concern;
(iii) Evaluation of proposals for introduction in an objective manner;
(iv) Management of exotics already present in India; and
(v) Surveillance and Disease Reporting and establishment of a network of diagnostic laboratories.

Necessary infrastructure and human resources should be urgently provided for effective implementation of the above Plan.

4.3.11 The problem is most acute in livestock. The greatly accentuated livestock Biosecurity problems are generally linked with unmindful industrialised productions located within or close to cities using infected water, feed and other inputs, flouting all the norms, standards and guidelines. Little heed is paid to the instructions and guidelines, underlining the lack of awareness and sensitivity. For instance, the Ministry of Agriculture had communicated Biosecurity Measures to all the States, but these have hardly been adopted at the ground level. The recurrence of Avian Flu in certain pockets in the country points to this apathy.
4.3.12 Infectious diseases cause an annual loss of about Rs 50 billion, besides the losses due to export restrictions and the impending danger of public health hazards. In case of epidemic outbreaks the losses are much more colossal. A case study in Canada (2004) has brought out the seriousness of this problem in an extremely lucid manner (see Box III). Unfortunately, the recent outbreak of Avian Influenza caused by strain H5N1 threatens total collapse of the Indian poultry industry (see Box IV).

Box III. Livestock Revolution Threatened

One of the most spectacular event in Canadian biosafety history was certainly the rapid spread and responsive cull of the avian flu H7N3 in 2004 in BC’s Fraser Valley, where 84 percent of BC’s poultry industry is located. The disease, less deadly to humans than the H5N1 strain found in Asia, was first found in geese and ducks on February 18 near Abbotsford, and was diagnosed over a large cluster of commercial poultry farms by March 22. Over the next eight weeks, an astonishing 42 farms were infected, and approximately 19 million chickens, turkeys and ducks were slaughtered. “Depopulation” procedures were stopped on June 4, 2004, but strains of bird flu continue to be detected across the country.

More ominously, in late 2004 influenza experts warned of a possible “perfect storm” of infection that could easily kill millions. Certainly the experience of the so-called Spanish flu, which killed some 40-50 million people during and following the First World War, suggests that another such catastrophe is possible. As of August 2005, the H5N1 avian influenza virus had killed over 50 people in Asia, and it has been discovered in places as distant as Russia, Greece, Kuwait and Israel. Epidemiologists worry that the flu could mutate into a strain that can spread rapidly among humans, let alone the hundreds of thousands of poultry birds culled currently in certain pockets of India.

Source: Stoett Peter, 2006, Biosecurity: The next public policy imperative for Canada and the World

4.3.13 Besides the above mentioned incidence of Avian Influenza, transboundary transmissions of exotic diseases in the past also have inflicted severe losses to our livestock and poultry industry. Notable examples of such transmissions into India are listed below:

- Bluetongue in sheep
- Peste des petits ruminants (PPR) of goats
- Caprine arthritis encephalitis in goats
- Equine Influenza & EIA in horses
- Canine parvovirus infections in dogs
- Marek’s disease, Gumboro disease, egg drop syndrome, chicken infectious anaemia
- Swine fever, recognized for the first time in India in 1962 caused mortality of 3500 pigs
• Outbreak of African horse sickness in 1960 resulted in death of over 22,000 equines between 1960-1963.
• Introduction of bluetongue disease in sheep resulted from the import of exotic breed of sheep into the country.
• PPR first detected in 1989 from Tamil Nadu is widely spread in the country.
• Introduction of infectious hydro-pericardium (Lichi disease) of poultry through cross-border transmission.

Box IV. India’s Poultry Industry Faces Unprecedented Crisis

India’s Poultry Industry, which contributes Rs. 35,000 crores to the GNP and provides employment to over 3 million persons - the only segment of our agriculture economy which has been growing consistently at about 17% per annum – is facing the worst ever crisis in its history, and a situation of total breakdown and collapse, due to the recent outbreak of Avian Influenza caused by H5N1. This has dealt a severe blow, not only to the farmers but practically to every input industry related to poultry farming, such as hatcheries, breeder-integrators, feed mills etc.

If the breeders decided not to continue in the business (due to the setback from the outbreak), it will have an extremely adverse impact on the indigenous pure-line research and breeding activity and the country will be exposed to total dependence on imported breeding stock – which will be nothing short of a negation of all the good work done by indigenous genetic research for the past 3 decades. More than 1,000 hatcheries in the country will face total closure.

Study by a renowned economist from USA has revealed that in terms of competitiveness, India ranks no. 1 in the world: USA was placed at No. 4, China at No. 15 and Netherlands at No. 36. The study has further shown that India – which presently ranks No. 2 in the cost of chicken production will soon become the cheapest source of chicken production in the world, and this will even overtake Brazil.

It is projected that if the present rate of growth in the industry is sustained, in the next 5 years, poultry can be second largest industry in our country, next only to the automobile industry. It will be very unfortunate if this industry, which has been painstakingly built based on indigenous research over 3 decades, is destroyed (by the H5N1) and the country is forced to depend on import of eggs and chicken. An all out effort, including interim relief measures by the Government to the affected parties, should urgently be made to save this vital industry and put it back on the track.

Source: Anuradha J. Desai, Chairperson, National Egg Coordination Committee, April, 2006

4.3.14 Nearly 40 exotic animal diseases of economic importance are known. All effort, proactive and preventive, must be made to keep them away from the country. These exotic diseases as a matter of principle should not be handled in any of the existing open laboratories without containment facilities. The recently established High Security Animal Disease Laboratory (HSADL), IVRI, Bhopal in 1998 has BL-4 facility to safely handle high-risk pathogens/List “A” diseases of OIE and authorized by Govt. of India to handle exotic animal pathogens.
4.3.15 Recently, the Dept. of Animal Husbandry and Dairying (DAH&D) has
designated one central and four regional disease diagnostic referral laboratories under the
Animal Disease Management and Regulatory Medicine Scheme at Pune, Kolkata,
Bangalore and Jalandhar. The Centre for Animal Disease Research & Diagnosis
(CADRAD) of the Indian Veterinary Research Institute, Izatnagar has been identified as
the referral apex laboratory There are about 100-district level diagnostic laboratories in
the country.

4.3.16 Four Animal Quarantine Certification Stations (AQCS) are functioning at Delhi,
Mumbai, Chennai and Kolkata. The DAH&D is contemplating setting up two more
Quarantine Stations at Bangalore and Hyderabad, as these are now international airports
at which requests for imports are frequently received. There are no facilities available at
the seaports, which are very important imports points.

4.3.17 India is also establishing Diseases Free Zones for selected diseases by zoning
and buffer zoning keeping international view of OIE and WTO, with strict enforcement
of phytosanitary and zoosanitary requirements, yet another new initiative. But, effective
surveillance and survey facilities are essential for this purpose. Further, surveillance is
critical not only for detecting outbreaks, but also for improving veterinary practices and
treatments. The country is not well equipped to do this job. The requisite infrastructures
for diagnosis, surveillance, reporting etc. are not in place in many States.

4.3.18 There are several other points which should be considered while adopting the
quarantine practices. These include:

- What is the probability that vaccinated animal will not spread any infection when
  they are permitted to move?
- Should there not be a decontamination policy?
- Will the government (Central/State) allow import of any vaccinated animal in the
country without quarantine? If not, how is it proposed to meet the contradiction
  between the international and intra-national policies in this regard, especially if it
is raised in international forums? If allowed, what will be the role of all the Quarantine Stations established by the Government.

- As detention of animal or animal products would affect the economic conditions as well as livelihood of the owner/livestock farms adversely, it is desirable that the executive order for slaughtering of infected/suspected animals is issued by the highest authority like the President of India or the Governor of the State only for some selected diseases.

- There is considerable migratory or nomadic livestock activity that still exists in the country which requires a different approach and strategy, and the provisions of the Act need to be suitably amended to recognize this reality.

- Interplay between Central and State/Local Laws and clarity about the role of Central, State, and Local authorities, which would simultaneously have separate but concurrent legal quarantine power in a particular situation.

- The consistent production of high quality, safe, potent and efficacious vaccines requires quality assurance procedures to ensure the uniformity and consistency of the production process.

- Vaccine quality, safety, potency, and efficacy must be ensured by consistency in the production process; Control procedures selected should be those that best fit the conditions under which vaccines are produced and should comply with good manufacturing practices.

- Worldwide harmonization of standards for veterinary biologicals will be of help to chief veterinary officers who must follow the instructions given in the OIE International Animal Health Code, as they apply to all biological products for use in international trade; worldwide harmonization of registration rules should be ensured to simplify and facilitate international marketing of the products.

### 4.4.0. Global Convergence Towards Biosecurity

4.4.1 There is a growing global recognition that Biosecurity will profit from a more integrated approach. Closer cooperation among institutions responsible for implementing and the rationalisation of infrastructures, where appropriate, will be synergistically beneficial. Models to rationalise regulatory functions among sectors in the quest for
improved effectiveness and efficiency have appeared in a number of countries. For example, New Zealand has had a Biosecurity Act since 1993 and a Biosecurity Minister and Council since 1999. In Belize, food safety, animal and plant quarantine and environmental issues are dealt with by a single authority, the Belize Agricultural and Health Authority. USA, China and Australia have also followed this path.

4.4.2 The Australian government, State and Territory governments, industry and other key stakeholders are describing and reviewing the Australian Biosecurity System (ABS) with a view to further improvements and integration. The development of a consistent national framework of policy and processes within which to approach national Biosecurity issues is of major importance. Primary Industries Ministerial Council commenced development of an ABS to address the broader, longer term Biosecurity issues with regard to terrestrial animal pests and diseases, terrestrial plant pests and diseases, aquatic animal pests and diseases and terrestrial and aquatic weeds. The ABS will assist in identifying gaps in Biosecurity arrangements as to strengthen the country’s approaches, minimise pest, weed and disease impacts and demonstrate, nationally and internationally, Australia’s commitment to Biosecurity. The ABS aims to:

- Prevent pests entering and establishing in Australia;
- Ensure appropriate preparedness and response capacity which is internationally recognised and meets Australia’s trading obligations and international treaties; and
- Maintain or improve the status of Australia’s Biosecurity system.

4.4.3 The ABS provides a description of the roles of the various contributors and aims to improve the efficiency of investments in the system. While the same model will not fit everywhere, and each country should institutionalise its synergy path as per its capacity, need and goal, the Australian model appears closest to the proposed Indian approach. Thus, along with other partners, India may wish to work closely with Australia to share relevant experiences and expertise.
Several initiatives of the United Nations’ Organisations and other international organisations and institutions are actively promoting Biosecurity as per their mandates. The Agreement on the Application of Sanitary and Phytosanitary Measures (SPS Agreement) of the World Trade Organization disciplines SPS measures in relation to international trade. The Codex Alimentarius Commission (Codex), the International Plant Protection Convention (IPPC) and the Office International des Epizooties (OIE) provide international standards for food safety, plant health, and animal health, respectively. A further relevant instrument is the Cartagena Protocol of the Convention on Biological Diversity (CBD) which applies to the transboundary movement, transit, handling and use of Living Genetically Modified Organisms (LMOs). Guidelines on the management of invasive alien species have been developed under the CBD. These international agreements, standards and programmes are parts of a loose international framework for Biosecurity, and reflect the historically sectorial approach to regulation in this area.

The Food and Agriculture Organisation of the United Nations (FAO), recognizing the growing importance of Biosecurity, has made this area as one of its sixteen Priority Areas for Inter-disciplinary Action (PAIAs) which aims at “promoting, developing and reinforcing (Biosecurity) policy and regulatory frameworks for food, agriculture, fisheries and forestry.” The FAO programme clearly sees the advantages of a more coherent, holistic approach to Biosecurity that sought synergies between the sectors at national and international levels, without creating new or centralised, unified and rigid structures. The traditional focus on regulating individual production systems was shifting to one of ensuring confidence in the overall regulatory framework which would automatically seek interdisciplinarity, partnership and convergence. Many countries were revising their Biosecurity arrangements to take into account the SPS Agreement, at the same time seeking greater efficiencies.

FAO /Norway project on strengthening countries capacity to implement Biosecurity measures has recently been launched. Its main objective is to improve Biosecurity and strengthen national capacities to meet domestic and international marketing requirements, reduce risks of and increase preparedness for food system
shocks associated with disease and related outbreaks that increase the risk of food insecurity and market collapse. Eight Core Partner Countries, namely, Ethiopia, Ghana, India, Kenya, Nicaragua, Senegal, Uganda and Vietnam are participating. The Donors’ contribution is US$ 1 million per year, with a maximum of US$ 5 million over five years. The first phase starts this year. The project will address food safety, animal health, plant health, fish product safety, socio economic analysis, policy development and law and regulations. India should urgently avail of this opportunity by completing the necessary formalities and launch the project without losing any time.

4.4.7 The programme elements of the project are:

1. Biosecurity capacity needs assessment using existing tools.
2. Developing new tools to assess:
3. Baseline ability to implement international agreements;
4. Assessment of legal framework;
5. Animal health emergency response capacity analysis; and Plant health emergency response capacity analysis.
7. Studies on mitigating the impact of (or preventing) market collapse, and development of policy guidelines.
8. Development of guidelines in fish product handling incorporating the FAO code on responsible fisheries and other internationally agreed codes of practices.

4.4.8 Fortunately, India is participating in the FAO/Norway Project. As this Project is encouraging the development of methodologies and economic analysis in relation to Biosecurity, India may select cases where pest eradication campaigns, or the implementation of improved food standards, had resulted in quantifiable export increases, thus suggesting the way to replicate the success stories. One possible methodology could be developed around an analysis of the values of goods transiting through control and inspection systems, in relation to the costs of such systems. These could be extended to regional Biosecurity standards and procedures. Methodologies were required to document
the economic advantages flowing from cross-sectorial cooperation, and of documenting and analysing the costs and the benefits of public-private sector cooperation, as well as where investments in Biosecurity measures had been most successful. A further methodology could consider market opportunities in relation to the Biosecurity investments that would be required to realize them. This effort will provide India a greater visibility in the international era in the field of Biosecurity.

4.5.0 Functions, Organisational Structure and Management of the National Agricultural Biosecurity System

Functions

4.5.1 The NABS should determine the potential for synergies and harmonization within the national and sub-national regulatory frameworks that would result from a holistic and coordinated approach to Biosecurity. Policy-makers should recognize the importance of Biosecurity as a key element of sustainable development, and the benefits, including in trade, that can be gained from comprehensive approaches to Biosecurity. They should also appreciate the cost of not fully recognising the role of Biosecurity. Full awareness on part of all stakeholders is essential for sustaining and further strengthening this national movement.

4.5.2 Strategy of the NABS should be to synergise linkages among science and technology, education and training and commercialization and utilization in the different subsectors capturing both commonalities and specialities for synergistically addressing the four main Biosecurity components, namely, Preparedness and Prevention, Diagnostics, Surveillance and Input Management (Figure 1).

4.5.3 In a large country like India, NABS should recognize the efficiencies that may emanate from regional and sub-regional approaches to risk analysis, particularly in relation to animal and plant life and health, and living modified organisms, and reorganise or establish agro-eco-regional facilities as per specific challenges and opportunities. The various quarantine, SPS and zoosanitary facilities should be updated.
and adequately staffed to be in an ever-ready condition. The Plant Protection staff should be duly rewarded with befitting incentives.

Figure 1. Programme Strategies and Linkages

4.5.4 Risk analysis and management frameworks are essential to achieve Biosecurity. In the past, such frameworks have been mostly sectorial or used to address specific technical issues. In future, such frameworks should seek to improve collaboration among diverse interests and institutions (particularly agriculture, public health, environment, trade, and their associated stakeholders) to achieve Biosecurity in a mutually supportive manner, thus avoiding duplication and possible inconsistencies. There are several such opportunities which should be grabbed.

4.5.5 General principles for biological risk analysis in food and agriculture are the same, although procedures may differ depending on the hazards addressed. The IPPC, the Codex Alimentarius, the OIE, the CBD and its Cartagena Protocol, where appropriate, should apply coherent risk analysis methodologies in different sectors by jointly
analysing differences and commonalities in approaches, and use of terms in risk analysis. FAO may play an archestrating role in this area and help develop tools, including tools to extend the Phytosanitary Capacity Evaluation to other sectors, to assist the country to analyse her capacity-building needs that take account of the full scope of Biosecurity, including the communicational, legal, institutional, scientific and technical aspects.

4.5.6 The roles and responsibilities of both the public and private sectors should be considered in planning Biosecurity capacity-building initiatives. In India, agriculture related industries should play greater positive role in strengthening the national Biosecurity umbrella. The System should devise innovative measures to build partnerships involving all stake-holders.

4.5.7 Appropriate linkages and coordination mechanisms among existing and planned Biosecurity capacity-building initiatives should be established to enhance complementarity and avoid duplication of efforts, and to ensure that capacity building is directed at identified priorities.

4.5.8 The System should give highest attention to obviate the serious shortcomings in quantity and quality of necessary databases. The need to share information and to ensure better understanding of the requirements for achieving Biosecurity can hardly be overemphasised. The need for an Internet-based Biosecurity Portal to facilitate information exchange on Biosecurity is a priority. The importance of information access and exchange in developing Biosecurity capacity should also be recognised. India can play a leading role in developing appropriate mechanisms for information exchange in Biosecurity, and to participate in the development of information Portals.

4.5.9 In order to lead from the front, the NABS should develop a specific methodology or adopt the ones already used by other national and international programmes for identification, establishment and maintenance of a given strategic area and render it pest free as per the international standards. Such a project could be initiated involving State Governments, Farmers, Traders and other Stakeholders to “sanitise” and
declare all areas under identified leading varieties of mangoes as pest free for export to USA under the recent Indo-USA agreement and also highlighted under the Indo-USA Knowledge Initiative.

4.5.10 NABS may initiate projects in a few hot-spots in a highly scientific and professional manner - collection of ground facts and creation of database and benchmark information, undertaking detailed risk analysis and eradication of the risk (pathogen and pest) and monitoring the freedom of the eradicated area from the eradicated pest. It should also analyse impact of socio-economic and of agro-ecological and climate change on overall Biosecurity situation in the area.

Organisational Structure

4.5.11 Necessary capacity must be put in place to establish and sustain the National Agricultural Biosecurity System and harmonised with international Biosecurity standards for food and agriculture to take advantage of trade opportunities and technology sharing for enhanced and sustained agricultural production and farmers’ income. Achieving Biosecurity requires an understanding of, and the ability to analyse diverse and complex risks, and determine and apply measures in a coherent manner while respecting differences among sectors and organizations. Risk analysis and management, as mentioned earlier, is the most important unifying concept across different Biosecurity sectors.

4.5.12 In order to achieve its goal of rendering Indian agriculture biosecure, the NABS should have the following three mutually reinforcing components:

- **National Agricultural Biosecurity Council (NABC):** Chaired by the Union Minister of Agriculture, NABC will serve as a platform for convergence and synergy among the on-going and new programmes of different Ministries and Departments of the Government of India, as well as appropriate international and State Government Agencies and Private Sector Organisations. NABC will serve
as an apex policy making and coordinating body and will pay particular attention to strengthening the national capacity in agricultural Biosecurity as related to crops, farm animals, forestry and aquatic organisms. The existing infrastructure for sanitary and phytosanitary measures will be reviewed and major gaps filled. Such a multistakeholder apex level NABC would be essential to ensure the livelihood security of nearly 70 crores of our population engaged in agriculture, animal husbandry, fisheries, forestry and agro-processing. While in developed countries, any disaster arising from invasive alien species like H5N1 strain of the Avian Flu may be more of a human health problem, since hardly 2 to 3% of population is engaged in farming, agriculture is the backbone of the livelihood security system in rural India.

- **National Centre for Agricultural Biosecurity (NCAB):** This National Centre should have four wings dealing with crops, farm animals, living aquatic resources and agriculturally important micro-organisms. The major purpose of this Centre will be the analysis, aversion and management of risks, as well as the operation of an early warning system. NCAB will maintain databases relating to potential threats to Indian agriculture and human health security from alien invasive species. It will also serve as a watch dog agency helping to initiate pro-active action in the case of impending Biosecurity threats. NCAB will provide the Secretariat for the National Agricultural Biosecurity Council. Further, it will work on the standardization of surveillance and control methods and help to introduce the latest molecular techniques like micro-arrays for disease diagnosis. NCAB will be largely a virtual organization with considerable capacity in computer aided monitoring and early warning systems. The four different divisions of NCAB could be located in appropriate existing ICAR Institutes / Agricultural / Animal Husbandry and Fisheries Universities, such as the High Security Animal Diseases Laboratory of ICAR at Bhopal.

- **National Agricultural Biosecurity Network (NABN):** NCAB will serve as the coordinating and facilitating center for a National Agricultural Biosecurity Network designed to facilitate scientific partnerships among the many existing
institutions in the public, private, academic and civil society sectors engaged in biomonitoring, biosafety, quarantine, and other Biosecurity programmes. This will help to maximize the benefits from the already existing scientific expertise and institutional strengths. The National Agricultural Biosecurity Network could have four mini-networks relating to crops and forestry, animals including migratory birds, living aquatic organisms and agriculturally important microbes.

4.5.13 The establishment of a National Biosecurity Council, National Centre for Agricultural Biosecurity and a National Agricultural Biosecurity Network will help us to strengthen considerably our ability to undertake pro-active measures to prevent the outbreak of pandemics and the introduction of invasive alien species. Such an Agricultural Biosecurity Compact is an urgent national need since prevention is always better than cure.

**Agricultural Biosecurity Compact**

4.5.14 Among other areas which require urgent attention from the proposed National Agricultural Biosecurity Council, the following deserve priority.

a. Review all existing Acts relating to Biosecurity and identify and fill gaps in the existing regulatory framework. Based on such a review, develop a National Agricultural Biosecurity Policy for being placed before Parliament and the National Development Council.

b. Education: Education holds the key to prevent unconscious and ill-informed introductions of invasive alien species. There is need for launching a Biosecurity Literacy Movement in the country. Human resource development is also exceedingly important. A course may be introduced in all Agricultural, Veterinary and Fisheries Universities on Agricultural Biosecurity. This should be done at the basic degree level. A Media Resource Centre should be established by the proposed National Centre for Agricultural Biosecurity to give
authentic information to mass media, so that unnecessary panic is not created. The media require authentic and credible information from time to time.

c. Social Mobilisation: Agricultural Biosecurity should be everybody’s business and not merely that of a few government departments or academic institutions. It would be useful to train Grassroot Biosecurity Managers (at least one woman and one male) in every Gram Panchayat and Nagarpalika. Towns and Cities require equal attention to enlist urban populations in the fight against biologically dangerous introductions and to create a well-informed public opinion in relation to agricultural risks and human health hazards.

**Administrative Management**

4.5.15 The three components of NABS, namely, NABC, NCAB and NABN should be professionally-led bodies, capable of providing scientific and intellectual leadership and strategic guidance. These should be lean and virtual bodies, having effective structures suiting to the mandate of NABC as an apex integrating force in the area of Biosecurity. In order to be productive, these should have the necessary functional and financial autonomy and authority coupled with accountability. Also, the Chief Executives and other Staff should be eminent professionals and should work on a long tenure, without frequent changes.

**National Agricultural Biosecurity Fund**

4.5.16 NCF recommends the establishment of a National Agricultural Biosecurity Fund of Rs. 1,000 crores with an initial contribution by the Government of India and appropriate international and bilateral donors as well as private sector companies. Such a Fund is urgently needed for the following purposes.

- Strengthening infrastructure for sanitary and phytosanitary measures.
- Upgrading facilities for plant, animal and fish quarantine and certification.
• Establishing an off-shore genetic screening center for animals for the purpose of identifying genes for resistance to serious disease epidemics arising from invasive alien species, such as the H5N1 strain of the Avian Flu in poultry. Fortunately, there are unmanned islands in Lakshadweep which can be developed as off-shore Genetic Screening Centres. The present policy of killing indiscriminately all native breeds of poultry will be harmful and we may lose the opportunity of identifying genetic resistance to serious diseases. At the same time, off-shore screening in isolated areas will help to avoid risks within the country.

4.6.0 Epilogue

4.6.1 The National Commission on Farmers urges the Government of India to take immediate action in setting up a National Agricultural Biosecurity Council, National Centre for Agricultural Biosecurity and a National Agricultural Biosecurity Network. The recommendations made above relating to strategic interventions and strategic partnerships also need immediate attention. Above all, a National Agricultural Biosecurity Fund will help to strengthen our infrastructure, introduce new molecular techniques of identification and verification, derive benefits from our animal genetic resources, and provide needed and timely help to the affected families.

Acknowledgement

National Commission on Farmers is grateful to Prof. V.L. Chopra, Member, Planning Commission and to a large number of leading experts from the ICAR system, Central Departments of Agriculture, Health and Medicine and Biotechnology for their active participation in an Expert Consultation on Agricultural Biosecurity organised under the Chairmanship of Prof. M.S. Swaminathan at the Indian Agricultural Research Institute (IARI), New Delhi, on March 18, 2006. The Commission greatly appreciates the cooperation of the Government of Gujarat for deputing Shri Kishor Rao, Principal Secretary, Animal Husbandry and Fisheries, who gave a detailed account of the ground realities and his personal experience of management of Avian Flu caused by H5N1 in Gujarat.
Presentations and interventions/ remarks particularly by Prof. Chopra, Dr. S. Nagarajan (Chairperson, PPVF&RA), Dr. G.S. Toteja (DDG, ICMR), Dr. Natesh (Sr. Adviser, Deptt. of Biotechnology), Dr. M.P. Yadav (Director, IVRI), Dr. Anupam Varma (Ex-National Professor, ICAR), Dr. Taneja (DDG, ICAR), Dr. Sushil Kumar (Director, NDRI), Shri Ashish Bahuguna (Joint Secretary, Plant Protection, MOA), Dr. S.P.S. Ahlawat (Director, National Bureau of Animal Genetic Resources), Dr. Ravi Khetarpal (Head, Plant Quarantine Division, NBPGR), Mr. William (Bill) Thorpe (Regional Representative, Asia, ILRI), Dr. S. Ayyappan (DDG, Fisheries), Dr. Mahadevappa (Ex-Chairman, ASRB) and Dr. N.B. Singh (Agriculture Commissioner, MOA) are greatly appreciated, which formed the base of this analysis and recommendations by the NCF on this extremely topical subject.

Grateful thanks are also due to FAO, especially Dr. Louise Fresco (ADG, AG), Shivaji Pandey (Director, AGS), Mahmoud Solh (Director, AGP), Niek Van der Graaff (Chief, AGPP) and Peter Kenmore (Adviser, ADG/AG) from Rome Headquarters for sparing some latest documents on the subject and most importantly for including India as one of the core partners in an international FAO/Norway project on agricultural biosecurity. The useful support received from the FAO Country Office, New Delhi (Dr. D. Gustafson and Mr. Gopi Ghosh) is also gratefully acknowledged.

The Commission is thankful to Dr. A.K. Singh, Director, IARI and to the Heads of IARI Departments of Plant Pathology, Entomology and Microbiology for providing both logistic and technical supports to the Consultation.
ACKNOWLEDGEMENTS

The National Commission on Farmers is indebted to a large number of farmers’ organizations, scientific institutions and individuals for their advice and suggestions. NCF also acknowledges the valuable technical contributions by Shri S.S. Prasad, Joint Secretary, Ms. Mamta Shankar, Director, Ms. R.V. Bhavani, OSD to Chairman and Research Officers: Dr. (Ms.) Laxmi Joshi, Dr. Deepak Rathi, Dr. Pavan Kumar Singh, Dr. Ramesh Singh and the sincere work of Research Assistant, Dr. Prabhu Dayal Chaudhary and the secretarial staff of the Commission in the preparation of the Fourth Report.
SERVING FARMERS AND SAVING FarmING
Fifth and Final Report, 4 October 2006
Towards Faster and More Inclusive Growth of Farmers’ Welfare

“To those who are hungry, God is bread” – Mahatma Gandhi, 1946

“Everything else can wait, but not agriculture”- Jawaharlal Nehru, 1947

Our work during the last two years has been guided by the above words of the architect of our independence on the one hand, and by the prime mover of planned development designed to promote faster economic growth coupled with social and gender equity, on the other. The approach to the XIth Plan is “faster and more inclusive growth”. Obviously this aim should cover 70% of our population, who live in villages and whose major occupation is crop and animal husbandry, fisheries, agro-forestry and agro-processing. The four reports submitted by us since December 2004, all contain concrete suggestions on how this goal can be achieved.

This fifth and final report deals with some of the key issues confronting our farmers and farming such as the economic survival of farmers with small holdings in a globalised economy, shaping the economic destiny of farmers, strengthening the ecological foundations essential for sustainable agriculture, attracting and retaining youth in farming, and restoring the glory of Indian farmers and farming. It presents an action plan for making hunger history. The Revised Draft National Policy for Farmers is submitted separately, based on widespread consultations throughout the country as well as extensive advice received from Central and State Government Departments, farmers, farmers’ organizations, tribal families, women’s organizations, academia, civil society organizations, political parties, panchayat institutions, mass media representatives and individuals.
We are indebted to Shri Sharad Pawar, Union Minister for Agriculture, Food, Public Distribution and Consumer Affairs, for his continuous guidance and encouragement and for being the major source of inspiration in our work.

We have chosen for the cover of this Final Report an extract from the Visitors Book of the National Dairy Research Institute, Bangalore, showing the Father of the Nation identifying himself as a “Farmer”. It is this pride in farming, both as a way of life and means to livelihood that we should revive. This is the pathway to “Purna Swaraj” and this report shows the way.

ABOUT NATIONAL COMMISSION ON FARMERS

National Commission on Farmers was set up under the Chairmanship of Shri Sompal vide Resolution No. 8-2/2003- Policy (ES) dated 10th February, 2004. The Commission was reconstituted under the Chairmanship of Prof. M.S. Swaminathan vide Resolution No. 8-2/2003- Policy (ES) dated 18th November, 2004 with Terms of Reference which reflected the priorities listed in the Common Minimum Programme of the United Progressive Alliance Government. The Terms of Reference of the Commission and its composition are at pages iii to v.

The National Commission on Farmers has held 37 formal meetings during the last two years. The Commission addressed the various issues facing farmers and farming as per its Terms of Reference by organizing a series of Technical Consultations in various parts of the country involving the principal stakeholders. A list of Technical Consultations is at Annexure A at pages 265-267.

The results of these Consultations were assimilated with the work of the Commission on specific issues. These were incorporated in four Reports of the Commission, which were submitted to the Union Agriculture Minister in December 2004, August 2005, December 2005 and April 2006 respectively. Presentations were also made to the Planning Commission, Government of India and the National Advisory Council. The list of these Reports and the dates of their submission are at Annexure B at page 268. In particular, Chapter 2 in the Fourth Report contained Jai Kisan: “A Draft National Policy on Farmers” which was proposed for comments, public debate and consensus building and which was based on the work done and recommendations made by the Commission since its formation.

The Draft National Policy was thereafter discussed in State level Consultations with farmers including women farmers, and other stakeholders including NGOs, Bankers, Media and Scientists. A list of these Consultations is at Annexure C at pages 269-270. Based on these Consultations, where the women farmers and other farmers as well as...
their organizations were heard first, and the written suggestions and representations received from individuals, institutions and organizations, the Draft National Policy for Farmers was revised and elaborated. The Revised Draft Policy for Farmers is submitted separately. The National Commission on Farmers requests that the National Policy for Farmers, after the approval of Cabinet and National Development Council, may be adopted by the Parliament of India on 15th August, 2007 which would mark the 60th Anniversary of India’s Independence.

A table connecting the Terms of Reference with the Chapters in the Reports of the National Commission on Farmers is at Annexure D at pages 271-276.

NCF hopes that its recommendations will receive serious and urgent consideration by both the Government of India and State Governments.
TERMS OF REFERENCE
FOR
NATIONAL COMMISSION ON FARMERS

- Work out a comprehensive medium-term strategy for food and nutrition security in the country in order to move towards the goal of universal food security over time.

- Propose methods of enhancing the productivity, profitability, stability and sustainability of the major farming systems of the country based on an agro-ecological and agro-climatic approach and the harnessing of frontier technologies.

- Bring about synergy between technology and public policy and recommend measures for enhancing income and employment potential in rural areas through diversification, application of appropriate technology including IT for information on market, weather, credit facilities and e-commerce, training and market reforms.

- Suggest measures to attract and retain educated youth in farming and recommend for this purpose; methods of technological upgrading of crop husbandry, horticulture, animal husbandry, fisheries (inland and marine), agro-forestry and agro-processing and associated marketing infrastructure.

- Suggest comprehensive policy reforms designed to enhance investment in agri-research, substantially increase flow of rural credit to farmers including small and marginal, triggering agricultural growth led economic progress, which can lead to opportunities for a healthy and productive life to rural families.

- Formulate special programmes for dryland farming for farmers in the arid and semi-arid regions, as well as for farmers in hilly and coastal areas in order to link the livelihood security of the farming communities living in such areas with the ecological security of such regions. Review in this context, all ongoing Technology Missions like those relating to pulses, oilseeds, maize, cotton, watershed etc. and recommend methods of promoting horizontal integration of vertically structured
programmes. Also suggest credit-linked insurance schemes, which can protect resource poor farm families from unbearable risks. Further, suggest methods of strengthening and streamlining the National Horticulture Development Board.

- Suggest measures for enhancing the quality and cost competitiveness of farm commodities so as to make them globally competitive through providing necessary facilities and application of frontier sciences and promote quality literacy for codex alimentarius standard, sanitary and phyto-sanitary measures among farmers through reorienting and retooling extension machinery. Also suggest methods of providing adequate protection to farmers from imports when international prices fall sharply.

- Recommend measures for the credit, knowledge, skill, technological and marketing empowerment of women, taking into consideration the increasing feminization of agriculture and the proposed conferment of right to land ownership.

- Suggest methods of empowering male and female members of elected local bodies to discharge effectively their role in conserving and improving the ecological foundations for sustainable agriculture like land, water, agro-biodiversity and the atmosphere with priority attention to irrigation water.

- Consider any other issue, which is relevant to the above or is specially referred to the Commission by Government.

The Commission is to submit a medium term policy for food and nutrition security in the country in order to move towards the goal of universal food security over time within the next three months and to submit its recommendations on other Terms of Reference as soon as practicable and in any case on or before 13th October, 2006. The Commission, however is permitted to submit interim reports on any of the Terms of Reference it deemed fit or expected of it.

COMPOSITION OF THE
NATIONAL COMMISSION ON FARMERS

The composition of the reconstituted National Commission on Farmers is as under:

**Chairman**
Prof. M.S. Swaminathan

**Full-Time Members**
Dr. Ram Badan Singh
Shri Y.C. Nanda

**Part-Time Members**
Dr. (Ms) Chanda Nimbkar
Shri Atul Kumar Anjan
Dr. R.L. Pitale
Shri Jagadish Pradhan

**Member Secretary**
Shri Atul Sinha,
I.A.S. (Retd.)

CHAPTER 1

PUTTING FARMERS FIRST

1.1 Introduction

1.1.1 The National Commission on Farmers (NCF) has held consultations over the last two years with State Governments, Financial and Insurance Institutions, Representatives of Farm and Tribal Women and Men, and Civil Society Organisations, Academia and Media Representatives working on problems relating to farming and farmers. In addition to several meetings in New Delhi, Consultations have been held at various locations across the country, based on the issue being addressed, as per the terms of reference. State-wise Consultations have also been held for feedback on the Draft National Policy for Farmers. Four Reports have already been submitted and this is the Fifth and Final Report. This chapter is a synoptic account of some of the major recommendations made in the earlier Four Reports. A box on a Livelihood Security Compact for the agrarian distress hotspots is also included.

1.1.2 To achieve secure and adequate livelihood for all farmers, as defined in the draft Policy, they must be assured of access to and some control over the basic resource base for livelihood. These are both natural and societal. The first category includes land, water and bioresources; while the second refers to human and institutional resources such as credit and insurance, technology and knowledge management, markets, and other inputs and services.

1.1.3 The ecological foundations essential for sustained advances in agricultural productivity in India, such as soil, water, biodiversity and forests are under severe anthropogenic pressures. The ecosystem’s capacity to support the human and farm animal population has been exceeded in many parts of the country. The quantity and quality of groundwater, which is now the dominant source of irrigation water, is fast deteriorating. Although India has over 20% of the world’s farm animal population, good grazing lands are practically non-existent. Fodder and feed production is also not
adequate. Compounding current problems, the possibility of adverse changes in rainfall, temperature and sea level due to global warming and climate change is no longer just a theoretical possibility.

1.1.4 In the area of farm economics, resource flow to the agriculture sector is declining, and indebtedness of small and marginal farm families is rising. Input costs are increasing, while factor productivity is declining. The cost-risk-return structure of farming is becoming adverse, to over 80 million farming families operating small holdings, since the resource-poor families cultivating 1 to 2 hectares (ha) or less are unable to benefit from the power of scale at either the production or post-harvest phases of farming. Both meteorological and marketing factors influence the well-being of small farm families, who lack the capacity to withstand the shock of either crop failures or uneconomic market prices for their produce.

1.1.5 A technology “fatigue” has further aggravated farmers’ problems, since the smaller the farm the greater the need for sustained marketable surplus, in order to have cash income. Linkages between the laboratory and the field have weakened and extension services have often little to extend by way of specific information and advice on the basis of location, time and farming system. Good quality seeds at affordable prices are in short supply and spurious pesticides and biofertilisers are being sold in the absence of effective quality control systems. Input supply is in disarray, particularly in dry farming areas. Micronutrient deficiencies in the soil as well as problems relating to soil physics are crying for attention. Farmers have no way of getting proactive advice on land use, based on meteorological and marketing factors. Though it is now over twelve years since the WTO regime started operating in agriculture, serious attempts are yet to be made in rural areas to launch movements for quality literacy (sanitary and phytosanitary measures and Codex Alimentarius standards of food safety), trade literacy (likely demand-supply and price situation), legal literacy (IPR, Farmers’ Rights), and genetic literacy (genetically modified crops). No wonder the prevailing gap between potential and actual yields, even with technologies currently on the shelf, is very wide. Such a knowledge deficit pointed out in the reports of the NCF has been highlighted in the Approach Paper to the Eleventh Plan.
1.1.6 1968 marked the beginning of the Green Revolution leading to quantum jumps in the productivity and production of wheat and rice. But the last 10 years have witnessed a fatigue in the Green Revolution with the growth rate in foodgrain production falling below population growth for the first time since then. It implies human numbers are increasing faster than our capacity to make the goal of Food for All a reality. At the same time, consumption per capita is not going up, due to inadequate purchasing power at the household level. A “famine” of jobs/ livelihoods as a result of poor growth of opportunities for employment in the rural non-farm and off-farm sectors is leading to a “food famine” at the household level. According to the Union Planning Commission, we are off-track in achieving the UN Millennium Development Goal of reducing the number of hungry persons by half by 2015. Also, we are off-track in reducing infant and maternal mortality rates and in achieving universal primary education.

1.1.7 To double annual foodgrain production from the present 210 million tonnes to 420 million tonnes within the next 10 years, (by 2015), will call for producing at least 160 million tonnes of rice from 40 million ha, and 100 million tonnes of wheat from 25 million ha. Pulses, oil seeds, maize and millets will have to contribute another 160 million tonnes. In addition, the national goal is to raise the production of vegetables and fruits to over 300 million tonnes by 2015. Since land is a shrinking resource for agriculture, the pathway for achieving these goals can only be higher productivity per unit of arable land and irrigation water. Factor productivity will have to be doubled, if the cost of production is to be reasonable and the prices of our farm products are to be globally competitive. The average farm size is going down and nearly 80% of the farm families belong to the marginal and small farmer categories. Fortunately, the ownership of livestock is more egalitarian. Enhancing small farm productivity, increasing small farm income through crop-livestock integrated production systems and multiple livelihood opportunities through agro-processing and biomass utilisation, are essential both to meet food production targets and for reducing hunger, poverty and rural unemployment. Programmes designed to achieve these goals must be “engendered”,
since there is increasing feminisation of agriculture, poverty and under-nutrition, not to mention the increase of HIV/ AIDS cases.

1.1.8 2005 was a difficult year both for the nation and for farm and fisher families. Beginning with the titanic tsunami of 26 December 2004, and ending with the disastrous earthquake in Kashmir and floods in Tamil Nadu, our farm and fisher families have been subjected to the fury of nature in the form of drought, unseasonal and heavy rains (like the one which caused damage to the onion crop in Maharashtra), and floods. Institutional support to small farmers is weak. The same is true of post-harvest infrastructure. For example, even now paddy is being dried on the road in many places. The spoilage losses can be as high as 30% in the case of vegetables and fruits. Institutions which are supposed to help farmers, such as research, extension, credit and input supply agencies, are by and large not pro-poor and pro-women. Mechanisms for risk mitigation are poor or absent. There is no minimum support price (MSP) or procurement arrangement for the crops grown in dry farming areas. Hardly 10% of farmers are covered by crop insurance. Farm families are also not covered by health insurance. There is no Agricultural Risk Fund. Both risk mitigation and price stabilisation are receiving inadequate policy support. The cost of production is invariably higher than the minimum support price, due to ever-increasing prices of diesel and other inputs. Investment in agriculture has suffered a decline over the past two decades. Capital formation in agriculture and allied sectors in relation to GDP started declining in the 1980s and is only now being reversed. This has adversely affected irrigation and rural infrastructure development.

1.1.9 The cost-risk-return structure of farming is becoming adverse. Consequently, indebtedness is growing in rural areas. In Maharashtra, over 55% of the State’s farm households are in debt. Average household size of farmers is 5.5 at the all-India level. In the low-income groups, the average size goes up to 6.9. According to NSSO-59th Round, the average monthly per capita consumption expenditure of farm households across India was Rs. 503 in 2003. Endemic hunger (i.e., chronic undernutrition), is high both in families without assets like land or livestock, as well as in families with small land holdings but no access to irrigation. An unfortunate consequence of the constellation of hardships faced by small farm families is the growing number of suicides among farmers.
The situation is particularly alarming in parts of Vidarbha in Maharashtra. To our shame, the suicide hotspots include Wardha district, where Mahatma Gandhi spent a significant part of his life fighting for freedom from colonial rule, so that the country could be rid of hunger, poverty and gender injustice.

1.1.10 Indebtedness of farmers is rising not only because of farming-related expenditure, but also because of the need for healthcare. The public healthcare system in villages is in a state of collapse. Pandemics like HIV/AIDS and tuberculosis are spreading in villages, with women being the main sufferers. Because of protein-energy undernutrition, as well as micronutrient deficiencies, a purely drug-based approach to the control of diseases is not adequate. A nutrition support programme is equally important.

1.1.11 Policy reform in agriculture is thus long overdue. Such policy reform should be pro-small farmer and pro-women and pro-landless agricultural labour. It should pay particular attention to the promotion of conservation agriculture and remunerative marketing. If we do not attend to the problems of small farm and landless agricultural labour families with a sense of urgency and commitment, the Indian enigma of the co-existence of enormous technological capability and entrepreneurship on the one hand, and extensive under-nutrition, poverty and deprivation on the other, will not only persist, but will lead to social disruption, violence and increasing human insecurity. Without peace and security, enduring economic progress will not be possible. NCF therefore recommended in its Third Report that the agricultural year 2006-07 be designated as the Year of Agricultural Renewal or the Year of the Farmer.

1.1.12 We would like to stress that agriculture being a State subject, State governments are also accountable for providing adequate support, particularly to meet the needs of location-specific agricultural problems, as well as the health, education, drinking water, social security and other social and production infrastructure essential for farm and agricultural labour families to have an opportunity for a healthy and productive life.

1.1.13 The seven core areas needing urgent attention to make farming a viable activity for farmers are land, water, and bioresources on the one hand and credit and
insurance, technology, knowledge management, markets, and inputs and services on the other.

1.2 Land

1.2.1 The basic issues of access to land for both crops and livestock, and some control over its use are:

- unfinished agenda of land reform,
- speedy distributions of ceiling-surplus and waste lands,
- land rights for women,
- preventing diversion of prime agricultural land and forests to corporate sector for non-agricultural purposes
- ensuring grazing rights and seasonal access to forests to tribals and pastoralists and access to common property resources;
- Equally important are the technical issues concerning land.

1.2.2 The second Green Revolution has to begin in dry farming areas, which need particular attention from the point of view of overcoming macro- and micronutrient deficiencies. An important reason for the low return per unit of water is the lack of synergy between a genetic strain, irrigation water and soil nutrition. “Hidden hunger” in the soil resulting from micronutrient deficiencies results in “hidden hunger” in both farm animals and human beings. Soil health enhancement holds the key to improving the return from investment in other inputs like seeds and water.

1.2.3 Reliable soil tests for 13 macro- and micronutrients are critical for improving crop productivity. This requires sophisticated, finely-tuned equipment that are currently unavailable in most soil testing laboratories. The objective should be to provide a complete soil test analysis at the commencement of each cropping season, specifying the crops most suitable for cultivation according to the soil profile and providing detailed instructions on how to enhance the soil to ensure proper plant nutrition for optimal yields and profitability. Soil test results will be of little value unless expert advice is available to the farmers to interpret the significance of nutrient levels and recommend appropriate
steps to enhance soil nutrition. Computerised systems must be developed for at least 20 major crops, customised to different agro-climatic zones.

1.2.4 Initially, farmers may not fully appreciate the value of a complete soil test, so the government should conduct an intensive programme of free tests for the first one or two years, demonstrating the efficacy of the approach. Thereafter, fees can be charged to recover costs. In the first phase, there should be a minimum of one laboratory per district, each with the capacity to conduct a minimum of 10,000 complete soil analyses per month.

1.2.5 A Soil Health Card containing integrated information on the physics (soil structure, occurrence of hard pan in the subsoil, etc.), chemistry (soil organic matter and macro- and micro-nutrient status), and microbiology (occurrence of earthworms, soil micro-organisms etc.) of the soils should be issued to each farm household. Such cards combined with the required advice can gradually lead to the technological upgrading of farm practices

1.2.6 Implementation of the technology will require a quantum jump in the number of soil testing laboratories and soil test analyses conducted throughout the country. Existing laboratories should be upgraded and supplemented by new testing facilities. A national monitoring agency must obtain and compare test results on standard samples on a regular basis to maintain test accuracy. If a commercial fee structure is fixed at around Rs. 200 to Rs.250 per test, then farm graduates will be attracted to supplement the government effort by establishing agri-clinics which can undertake such tasks as soil health monitoring and management as well as pest proofing on an area basis. Agri-clinics can also be established in Farm Schools and Village Knowledge Centres.

1.2.7 The tsunami that swept over coastal areas in Tamil Nadu, Kerala, Pondicherry and the Andaman and Nicobar Islands in December 2004 caused untold damage to soil and water bodies. There was deposition of slushy grayish brown clay and sand on agricultural soils. Seawater entered prime agricultural land adjoining the coast, rendering both soil and water saline. Many of the small water ponds that are the source of irrigation
for the second and third crop were severely affected. Ad hoc recommendations were being given to the affected farmers by both NGOs and government departments. NCF, therefore, organised a travelling workshop comprising a team of scientists with the best possible technical expertise available in the country. The scientists visited affected villages and made their recommendations on soil health restoration, water management and seawater replacement, crop and varietal choice, introduction of livestock farming for supplementary nutrition and income, and producer-oriented marketing.

</table>

1.3 **Water**

1.3.1 Rainfed agriculture, however risky and vulnerable, continues to play an important role in India, contributing 60 per cent of the cropped area and 45 per cent of the total agricultural output. Out of the gross sown area of 192 million ha, only 43 per cent is estimated to be irrigated, while the rest is dependent on rainfall. Water for agriculture, including both crops and livestock, remains the most critical and perhaps the most
limiting factor on its growth. The decreasing prices of cereal grains in the world, has contributed to making the irrigation infrastructure in the developing world even more difficult to sustain. Farmers of the South find it difficult to compete with the subsidies for grain production in the industrialised world and this makes them devalue their natural capital – water for irrigation. Further, as the cost of infrastructure has increased, it has not been possible to recover the cost of the capital investment and operation and maintenance of the system from individual farmers. In most States of the country, less than 30 percent of the costs of maintenance of the system are recovered. This has led to deterioration in systems, with an estimated 20-25 million ha of surface water irrigated canals in need of desperate repair. Further, water charges are based on the area of land and type of crop and not on the volume of water used, which then leads to inefficient use and resultant scarcity.

1.3.2 The recently concluded 3rd minor irrigation census finds that as much as 62.4 million ha -- 75 to 80 per cent of the irrigation potential is under groundwater. The roughly 19 million wells – dugwells, shallow and deep tubewells – in the country form the bulk of irrigation infrastructure in the country and a large part of it is in private hands.

1.3.3 The issue of water is not just about scarcity but about its careful use and equitable and well distributed access, so water management strategies need to be carefully designed. Water management must be designed to harvest, augment and use local water resources leading to equitable local wealth generation. This new water infrastructure will need new forms of institutional management and here we must learn from our traditional community based water management systems.

1.3.4 The use of water in agriculture will face greater and greater competition from other sectors — in industrial and urban areas — and this will inevitably lead to conflict, and need policies for conserving water in all sectors. The use of water in agriculture is “consumptive”: that is the used water is consumed and ‘virtually’ transferred to us via a

---

ii Ministry of Water Resources 2005, Report on 3rd Census of Minor Irrigation Schemes, Minor Irrigation Dept, GoI, New Delhi, June
product in our food. This is different from the use of water as a process, where water is mostly discharged after use and rejoins the water cycle. For instance, cities discharge 80 per cent of the water consumed as sewage back into the hydrological system.

1.3.5 In water scarce areas, emphasis should be placed on the cultivation of high value and low water requiring crops, such as pulses and oilseeds. In paddy and sugarcane, water-saving methods of cultivation like those inherent in the System of Rice Intensification (SRI) methodology should be popularised. Seawater farming should be promoted in coastal areas through the crops that thrive in salt water. Investment in research to promote water-efficient crops is essential. “More crops per drop of water” should not remain just a slogan.

1.3.6 Worldwide research suggests that groundwater is actually more productive (producing more crops per hectare) than surface water, because farmers who use groundwater can get as much water as they need, whenever and wherever they want. So that, while canal irrigation had been the main driver of irrigated agriculture in the 1970s, groundwater became the major force by the 1990s. The Central Groundwater Board estimates that groundwater is over-exploited in 65 per cent of the districts in the country. The electricity subsidy worsens the situation, with farmers using almost double the water for each unit of crop when they have access to cheap or free power, as compared to pump-sets using paid diesel. But worse, electricity supply to farmers is always uncertain and unreliable, which affects their capacity to take decisions. A policy for agricultural reform, must take into account the need to evolve programmes for recharge and management of the groundwater reserves of the country, so that extraction is limited only to what we can annually recharge. Today, much of the recharge is natural and incidental and depends on various factors like rainfall, soil characteristics and geomorphology. The Central Groundwater Board estimates that the highest infiltration is between 20 to 25 per cent (in sandy areas). There is a need to rebuild reserves through artificial recharge using rainfall and monsoon flows in rivers.

1.3.7 Water harvesting is not about an instant (annual) miracle. It will take time and investment to replenish our rural capital, like a bank account on which we have an
overdraft. Villages which have practised water conservation for 7 to 10 years at a stretch are able to build capacity to withstand even prolonged drought. But the challenge is to build this programme with farm families, as they alone can invest in their water security. In this context, the government programme to “launch a massive scheme to repair, renovate and restore all the water bodies that are linked to agriculture” is of paramount importance.

**Box II**

**WATER**

1. Reforms to enable farmers / users to have sustained and equitable access to water must be put in place. Women must be represented in Water User Associations. A comprehensive set of Aquarian Reforms must be developed to foster sustainable and equitable use of both coastal and inland waters for capture and culture fisheries.

2. Water literacy and water quality management movements should be launched with panchayats as the leading players and increasing water supply through rainwater harvesting and recharge of the aquifer should become mandatory. “Million Wells Recharge” programme, specifically targeted at private wells should be launched. Rain, river, ground, sea, and treated sewage waters should all be included for effective use of available water resources, with regulations for sustainable use of groundwater.

3. A greatly enhanced investment in irrigation sector is needed under the 11th Five Year Plan apportioned between large surface water systems; minor irrigation and new schemes for groundwater recharge. The funds under the Bharat Nirman Programme must be allocated for this purpose.

4. The National Programme for Repair and Renovation of Water Bodies linked to Agriculture, under the Union Ministry of Water Resources, must be reviewed for more effective implementation with increased investment. Funds under the National Rural Employment Guarantee Act, the proposed Backward Area Programme and the National Watershed Programme should also be targeted for soil and water conservation.

5. The private investment in groundwater by farmers needs supportive and affirmative programmes to address recharge and long-term sustainability.

**1.4 Bioresources**

1.4.1 India is well endowed with rich flora and fauna as well as microflora and microfauna. Rural and tribal families depend for their nutrition and livelihood security on a wide range of bioresources. Bioresources for spreading biohappiness among local
communities should be the motto of all research and development programmes in biodiversity rich areas. Therefore the following areas require attention from both public policy makers and technologists.

1.4.2 Livestock production in India is largely by small holders and contributes to livelihood of over 70 million rural households. Unlike land holdings, livestock holdings are fairly equitable with over 70% of all species owned by smallholders. Livestock provides a major source of supplementary income for a huge majority of rural households and sustenance during drought and other natural calamities. Fisheries both inland and coastal, also contribute substantially to food supplies and to livelihoods in coastal and riverine areas.

1.4.3 The aim of policy is to conserve the rich biodiversity resources, utilize them sustainably for the livelihoods of communities and enhanced production, and share the benefits equitably. At the same time, access of communities, especially tribals / women to sources of biodiversity, such as forests and common property, should be protected. Enabling holders of traditional knowledge (TK) about biodiversity, especially women to get recognition and reward is another important aim.

1.4.4 In addition to conservation, enhancement and improvement of crops and farm animals as well as fish stocks through breeding, is an important dimension.

1.4.5 Development of new forage varieties and popularization of proven techniques of forage conservation such as silage making should be given priority.

1.4.6 Conservation and Genetic improvement of breeds

1.4.6.1 Community-based breed conservation (i.e. conservation through use) should be the preferred policy as far as possible with a scheme of incentives to reward those who maintain pure breeds.

1.4.6.2 Ex-situ conservation (e.g. cryo-preservation of semen/embryos) of all endangered breeds should also be adopted as per international guidelines.
1.4.6.3 Export of indigenous breeds should be allowed. Farmers/livestock keepers who rear breeds for which there is good demand from abroad (e.g. Gir cattle, Murrah buffaloes, Jamnapari goats) should be encouraged and facilitated to form producer companies.

1.4.6.4 Import of suitable breeds should also be allowed to increase productivity of non-descript animals.

1.4.6.5 Private entrepreneurs and industrialists should be encouraged to set up nucleus and multiplier flocks rearing units of local breeds where scientific selection should be carried out for genetic improvement. Indirect subsidies such as tax exemption should be provided for the first five years to these entrepreneurs. The flocks will become self-sustaining by selling breeding animals after that and the breed conserved. They should be included under the venture capital scheme of NABARD.

1.4.6.6 Field based breeding and selection programs with field performance recording are necessary with farmer participation. Studies show that on the national or macro economic level, investments in breeding interventions are highly profitable, mainly due to the fact that the progress made is transferred to the subsequent generations.

1.4.6.7 Community-based organizations should be encouraged as service providers and these can become platforms for further livestock development initiatives. Establishing support services is especially important for farmer-suicide affected areas where livestock are to be provided to farmers as an alternative source of income.

**Biosecurity**

1.4.6.8 Agricultural biosecurity covering crops, trees, and farm and aquatic animals is of great importance since it relates to the livelihood security of nearly 70 per cent of the population, and the food, health, and trade security of the nation. Concerned with the impact of invasive alien species on the livelihood security of farm women and men, NCF in its first report (Dec 2004) stressed the need for a thorough review of the present
infrastructure and institutional framework in the area of agricultural biosecurity, including WTO specifications

1.4.6.9 A National Agricultural Biosecurity System should have the following principal goals:

- To safeguard the income and livelihood security of farm and fisher families as well as the food, health, and trade security of the nation through effective and integrated surveillance, vigilance, prevention, and control mechanisms designed to protect the productivity and safety of crops, farm animals, fish and forest trees.
- To enhance national and local level capacity in initiating proactive measures for monitoring, early warning, education, research, and international cooperation.
- To introduce an integrated biosecurity package comprising regulatory measures, education and social mobilisation.
- To organise a coordinated National Agricultural Biosecurity Programme on a “hub and spokes” model with effective home and regional quarantine facilities. This should be capable of insulating the major agro-ecological and farming zones of the country from invasive alien species of pests, pathogens and weeds.
Box III

Bioresources

1. Access to non-timber forest products including medicinal plants, gums and resins, oil yielding plants and beneficial micro-organisms is important, particularly to tribal families. Women in particular need access to bioresources since the task of collecting fodder and fuel wood falls on them.

2. Tribal and rural families have been playing an important role in the conservation and enhancement of biodiversity for a long time. As a result their traditional knowledge of medicinal, aromatic and other plants of value to human kind is very high. Traditional rights to access to biodiversity need to be safeguarded and strengthened. Also, their contributions to agro-biodiversity conservation and enhancement should be recognized and rewarded under the provisions of the Biodiversity Act and Protection of Plant Varieties and Farmers’ Rights Acts. Suitable and transparent methods of recognition and reward should be developed for this purpose. Such procedures must be gender sensitive since women play the dominant role in genetic resources conservation and selection.

3. Traditional knowledge systems must be protected and enriched. In the past tribal and rural families depended on more than a hundred species for their health and food security; both dying crops and vanishing wisdom must be protected and revitalized.

4. Steps should be taken to impart legal literacy to women and men in biodiversity rich areas, so that their rights and intellectual property can be safeguarded.

5. The utilization of bioresources for improvement of crops and farm animals must be done in a sustainable and equitable manner. Educational techniques like the preparation of local Community Biodiversity Registers and the organization of Genome Clubs in Schools will help to spread bio-literacy and enable the conversion of bioresources into products of commercial value. Community seed and germ plasm banks should be encouraged for both conservation and breeding purposes.

1.5 Financial Services - Credit and Insurance

1.5.1 Inspite of government pronouncements, credit is becoming increasingly difficult to access. It is obvious that dire financial straits are driving hapless farmers to take to extreme steps including suicides, which have assumed alarming proportions. Also, the credit disbursal system is ridden with corruption, of which there are numerous instances. There is also a large amount of diversion of credit for non-agricultural purposes. Distress sales by small/ marginal farmers to square off their debts or for immediate consumption purposes soon after harvest are quite common. It is normal for a farmer to get 10-15 percent discounted price for spot payment for his produce. According to reliable resources, about 50 percent of the marketable surplus of small/marginal farmers is disposed of in this manner. At present credit is generally available only for
improved technologies like hybrid crops, crossbred cows, etc., and not for sustainable farming practices.

1.5.2 The Kisan Credit Card (KCC) is a major innovation in agricultural credit, but of the nearly 4.5 crore KCC issued by the banks, very few cards have been given to women farmers, and no separate data are available in this regard. Since there are a very large number of women-headed farming families in the rural areas, a system to speed up issue of KCC to women farmers, as well as proper documentation should be evolved.

1.5.3 It is not just credit availability but the interest rate at which loans are given to resource-poor farmers that is the major problem today. Credit reform should include not only enhancement of the total amount available for farm loans, but also reduction in interest rates and support for market linkages.

1.5.4 The spread between the deposit and lending interest rates in India is high by international standards. Improved efficiency in financial intermediation must be by controlling both the transaction cost and the risk cost. Speed and manner in which the debt recovery and settlement process operates would need to be considerably improved.

1.5.5 Also, interest should be waived on loans in areas hit by drought and floods and for crops under heavy pest infestation. Compounding of interest on arrears should be applied only in the case of recalcitrant borrowers who do not pay their dues in spite of having adequate repaying capacity.

1.5.6 Lakhs of farmers have seen their insurance policies lapse after the initial payments. There are provisions in the insurance laws that allow LIC to revive the lapsed policies. If done, this would place large sums back in the farmers’ accounts and give them a sense of confidence. Crop insurance, which now covers only about 14 percent of the farmers, has to cover all farmers and all crops in a time-bound manner, with reduced premiums.

1.5.7 Natural calamities like drought, flood which are frequent and recurrent occurrences and pest infestation are serious and crippling risks. Rescheduling and
restructuring of their loans are not enough. Waiver of loans is also needed. An Agriculture Risk Fund, set up with contributions from the Central and State governments and banks in a predetermined fashion, could provide relief to farmers in the form of waivers in full/part of loans and interest.

1.5.8 An integrated micro insurance policy (Parivar Bima) providing floating cover for health and various risks will go a long way as a safety net for the poor.

**Box IV**

**Credit and Insurance**

1. The outreach of the formal credit system has to expand to reach the really poor and needy with special emphasis on women, tribals, dry land areas and for viable projects of sustainable farming practices. The rate of interest for crop loans should be reduced to 4 per cent simple, with government support. There is a need for moratorium on debt recovery, including loans from non-institutional sources, and waiver of interest on loans in distress hotspots and during calamities, till capability is restored. An Agriculture Risk Fund should be established to provide relief to farmers in the aftermath of successive natural calamities.

2. Kisan Credit Cards should be issued to women farmers, with joint pattas as collateral. Till these are available, indemnity bonds from husband or other male relative or guarantee from independent local persons of standing should be acceptable.

3. An integrated credit-cum-crop-livestock-human health insurance package should be developed and set in place. Crop insurance cover needs to be immediately expanded to cover the entire country and all crops, with reduced premiums and a Rural Insurance Development Fund may be created to take up development work for spreading rural insurance.

4. Livelihood finance, which is a comprehensive approach to promoting sustainable livelihoods for the poor, is the need of the hour. It comprises of:
   (i) Financial services (insurance for life, health, crops and livestock
   (ii) Infrastructure (finance for roads, power, market and telecommunications
   (iii) Investments in human development, agriculture and business development services (including productivity enhancement, local value addition, and alternate market linkages and
   (iv) Institutional development services (forming and strengthening various producers’ organisations such as self-help groups, water user associations, forest protection committees, credit and commodity cooperatives, empowering panchayats through capacity building and knowledge centres)
Moving From Suicide Relief to Suicide Prevention: 9 Point Action Plan

The NCF has in its various Reports addressed the issue of agrarian distress in rural areas of the country and the need to address the farmer suicide problem on a priority basis. This has to be on the basis of a three-pronged strategy, viz. i) Relief & Rehabilitation Measures to alleviate the distress and suffering of the affected families in the short term, ii) Address the issues responsible — unfavorable economics, risky technology, unfavorable weather, lack of irrigation water, institutional credit and remunerative markets, and iii) Psycho-Social Counseling. While the first measure is to provide immediate relief, the other two are preventive long-term measures.

The distress sweeping rural India flows from market failure and the gradual collapse of public services. The cost-risk-return structure of farming is adverse. Almost all the suicide and otherwise crisis-hit households record high health expenditures and are indebted to moneylenders. There is urgent need for both affordable health insurance, and the revitalization of primary healthcare centres. The National Rural Health Mission should be extended to such suicide hotspot locations on priority basis. The NCF in its Second Report stressed on the need for a Farmers’ Livelihood Security Compact. This has to be an integrated package of measures comprising:

1. **Setting up State level Farmers’ Commission** with farm men and women represented for ensuring dynamic government response to farmers’ problems.

2. **Credit**: Microfinance policies should be restructured to serve as Livelihood Finance, i.e. credit coupled with support services in the areas of technology, management and markets. The outreach of the formal credit system has to be expanded. In most cases, the indebtedness of farmers in distress areas is to informal moneylenders. The cut-off amount for debt waiver could be worked out in consultation with Panchayats and farmers’ representatives in the distress hotspot areas. Just interest waiver does not help a farmer in distress. In drought prone areas, credit should not be just for the season, but for a Credit Cycle of 4-5 years and include consumption credit, so that the farmer has the capacity to spread his/her liabilities and meet the repayment requirements.

3. **Insurance**: All crops should be covered by crop insurance and insurance relief should be immediate, with the village and not block as the unit for assessment. There should be a Social Security net with provision for old age support and health insurance. Lapsed life insurance policies of farmers should be revived as per extant rules and not allowed to expire. The integrated family insurance policy (Parivar Bima Policy) recommended by NCF in its First Report deserves to be examined and introduced to begin with, in dry farming areas.
4. **Irrigation Water:** Aquifer recharge, rain water conservation, equity, fairness and public good will have to be the basis of water policies. Decentralised water use planning has to be undertaken and every village should aim at *Jal Swaraj* with Gram Sabhas serving as *Pani Panchayats*.

5. **Access to quality and affordable inputs is crucial:** The government must urgently intervene to ensure that quality seed and other inputs reach farmers at affordable costs and at the right time and place. An integrated farming approach should be encouraged with support services in place.

6. **Technology:** Resource poor farmers have no coping capacity to withstand the shock of crop failure, particularly those associated with high cost technologies like Bt cotton. Low risk and low cost technologies which can help to provide maximum income to farmers should be recommended. Risk distribution agronomy should be propagated. Similarly, best possible advice based on remote sensing data should be used to identify locations for drilling wells.

7. **Remunerative Market and Price:** Swift action is required to overhaul the *ryuthu bazars* or farmers’ markets, most of which are controlled by traders. There is also need for focused Market Intervention Schemes (MIS) in the case of life-saving crops such as cumin in arid areas. A Price Stabilisation Fund should be in place to protect the farmers from price fluctuations. Swift action on import duties to protect farmers from international price is necessary (as in the specific instance of cotton farmers’ suicides in Vidarbha).

8. **Information Dissemination and Delivery System:** The vital role of the Agriculture Extension Officer must be recognised and the system revived and strengthened. KVKs in each district should function as *Krishi Aur Udyog Vigyan Kendra*, with a post harvest technology wing for providing training in value addition. Farm Schools maybe established in the fields of good farmers. Village Knowledge Centres (VKCs) or Gyan Chaupals should be setup in the farmers’ distress hotspots. These can provide dynamic and demand driven information on all aspects of agricultural and non-farm livelihoods and also serve as guidance centres.

9. **Psychosocial Measures:** There is need for public awareness campaigns to make people identify early signs of suicidal behavior, make them aware of different socially acceptable measures for solving problems and information on helpline centres; develop a group of volunteers from the community to provide counsel, encourage increased communication within families, media education on internationally accepted guidelines for reporting suicides and creation of taluk level mental health services. Agricultural and Animal Sciences Universities could form Hope Generation Teams (like NSS) of young male and female students who could stay in the distress villages for a few weeks and extend both technical and psychological support. An environment of Hope and Care has to be created.
1.6 Technology Development and Dissemination

1.6.1 The growing gap between technology, research and development and its clients, the farming community is becoming more and more obvious. Farmers both need and lack sound advice and expertise on a range of issues. There is also a tendency among some resource-poor farmers to take to high cost technology without the capacity to incur losses due to factors beyond their control.

1.6.2 Post-harvest technology is poor and there is little value addition particularly in the case of fruits, vegetables and spices, including a wide range of tubers and medicinal and aromatic plants. Sustainable intensification, ecologically, economically and nutritionally desirable diversification, and value addition to the entire biomass are important for raising small and marginal farm families above subsistence level. All this will call for initiating an era of knowledge intensive agriculture. Modern information and communication technologies (ICT) afford an opportunity for launching a knowledge revolution in rural India. The torch bearers of this revolution should be rural women and men. Participatory research and knowledge management involving farm women and men should be the principal pathways of research, education and extension. Farmers should be regarded as partners and innovators in bringing about agricultural transformation.

1.6.3 The Eleventh Schedule (Article 243G) of the Constitution, 73rd Amendment Act 1992, lists “agriculture, including agricultural extension” as the first among 29 items entrusted to panchayats for attention and action. There are nearly 240,000 elected panchayats and local bodies in the country and more than one million elected women members of the panchayats. If panchayats are empowered technically, financially and legally to assume these responsibilities, they could become catalysts of accelerated agricultural progress, particularly in the areas of sustainable natural resources management and productivity enhancement. At least one male and one female member of each panchayat/local body could be trained in integrated pest management, integrated nutrient supply, and scientific water management, as well as in new technologies such as biotechnology and ICT. Thus, a cadre of Rural Farm Science Managers can be established.
1.6.4 Technologies should help in promoting labour diversification and not displacement. Women farmers and farm workers particularly need to be assisted with implements and equipment which will help to reduce drudgery and the number of hours of work, while adding economic value to each hour of work.

1.6.5 Revitalisation of small farmer-friendly technologies should be based on sound principles of economics and participatory research and knowledge management. Lateral learning among farm women and men should be fostered, since farmer-to-farmer learning is based on the principle that “one ounce of practice is worth tons of theory”. In order to multiply the benefits from the experience and skills of outstanding farm men and women, Farm Schools should be established in their fields.

1.6.6 The veterinary curricula in use in the country at present generally neglect small ruminants, rabbits, camels, yak, mithun and pack animals. There should be adequate emphasis in the syllabus on these species so that veterinary graduates can ably handle the diseases and other problems specific to these species such as trypanosomosis in camels.

1.6.7 Incentives should be given to setting up hygienic medium-sized slaughter facilities that can handle 100-500 animals per day in rural areas. This will prevent their transport through long distances, generate local employment and clean packaged meat can be made available to nearby medium-sized towns and big cities.

1.6.8 Establish “Fish for All” training centres, which will enhance the capacity of fisher women and men in all aspects of the capture to consumption chain.

1.6.9 To impart a sense of grassroot realism to the capacity building programmes, there should be a system of on-farm training to farmers. Village-based farm schools can be set up with the assistance of agro-industries, Krishi Vigyan Kendras, agricultural colleges and research institutes. Agricultural graduates and lead farmers can be certified as instructors and offered incentives for establishing private farm schools to train local farmers. Farm schools should be linked to Village Knowledge Centres to provide access to multimedia training materials, computerised expert systems, and web-based technical and marketing information.
1.6.10 Technology Missions are tending to become “subsidy rich” and “technology poor”. Accountability is also lacking, with the result that in several important crops like pulses and oilseeds, domestic production is stagnating and imports are increasing. This is one of the causes for the mounting farmers’ distress in dry farming areas. The smaller the farm, the greater is the need for productivity improvement, so that the farm family can have additional marketable surplus. Enhancement of small farm productivity coupled with assured and remunerative marketing opportunities is the most effective means of reducing rural poverty. Fortunately, there is much scope for enhancing productivity even with the technologies currently on the shelf, provided market linkages can be tied up.

1.6.11 There should be a convergence of appropriate Technology Missions (like those relating to oilseeds, pulses, maize, cotton, horticulture, or milk) around a watershed or the command area of an irrigation project, together with the active involvement of panchayat institutions and local bodies. Convergence and synergy among the numerous Technology Missions now in progress will improve their utility and impact and also help to reduce overall transaction costs.

1.6.12 The cultivation of fruits, vegetables, flowers, spices, medicinal and aromatic plants is now happening in a big way in several parts of the country. Being perishable commodities, horticultural crops need effective infrastructure support in the areas of production, processing, storage, transportation and marketing. In villages adjoining large consumption centres (both for home and export markets), small farmers can be helped to organise Small Farmers’ Horticulture Estates covering an area of 200 to 500 hectares. Such estates will confer on farmers cultivating one to two hectares the power of scale both at the production and post-harvest phases of the horticultural enterprise. Specialised activities like seed production, tissue culture propagation, production of compost, vermiculture, biofertilisers, biopesticides as well as e-commerce can be carried out at those estates. Low cost greenhouses coupled with fertigation techniques can be promoted, in addition to high-tech horticulture which can be undertaken by farm and home science graduates. The production of good quality, disease-free planting material in all clonally propagated species and seeds and planting materials of varieties suitable for processing will help farmers in areas where production and processing are linked. Such symbiotic
linkages between producers and processors will facilitate sourcing of good quality raw material for the processing industry.

1.6.13 The textile sector is one of the major providers of employment and income in the national economy. With the coming to an end of the multi-fibre arrangement two years ago, our cotton producers, weavers, and the textile industry on the whole face both new opportunities and threats. Without enhanced efficiency, it is impossible to take advantage of emerging market opportunities. Technological upgrading of all the components of the cotton production-processing-marketing cycle will be needed to prevent problems and setbacks in this vital sector of our economy, particularly with reference to both employment and export earning potential. A revolution is needed in productivity, quality and value addition in cotton production and processing. To provide overall coordination and policy support it will be advisable to establish a multi-stakeholder National Cotton Council, with government participation and support.

**Box VI**

**Technology**

1. Research, education and extension systems should be revitalised to avoid both technology fatigue and technology gaps. Agricultural and rural universities, Home Science colleges and research institutes should foster participatory research and knowledge management systems with farm women and men. The linkages between agricultural universities and farm communities must be restructured and strengthened.

2. Farm Schools should be set up in the fields of farmers who have achieved outstanding success in their operations in order to foster farmer-to-farmer learning of new technologies.

3. There should be a proper match between production and post-harvest technologies and a post-harvest technology wing should be added to every Krishi Vigyan Kendra.

4. A cadre of Rural Farm Science Managers should be developed by training women and men members of every Panchayat/ local body in the management of farm technologies.

5. An umbrella organization of Farm Technology Mission should be set up for coordination and to avoid duplication and conflicting approaches.
1.7 Inputs and Services

Access to affordable inputs and services are crucial for the success of farming, especially for poor farmers.

1.7.1 Input Supplies

1.7.1.1 Input prices have shot up and are still escalating. Resource poor farm families are left to the mercy of input dealers who have emerged as the new moneylenders of the countryside. Quality control is becoming increasingly important. Control has to be exercised over false and exaggerated claims for inputs with laws in place for penalty. Companies have drastically lowered the minimum germination rate they assure farmers. In the case of seed, this has fallen to as low as 60 per cent which implies that a village buying 1000 bags of seed pays for that number, but gets only 600 in effect. Quality control is equally urgent in the case of fertilizers, bio-fertilisers, pesticides and biopesticides. There has to be a suitable agency for strict quality control of animal feed, drugs, vaccines and other biological products. Animal-rearers need to be protected from exploitation by unscrupulous manufacturers. It should be mandatory to print the digestible energy and protein content of the concentrate on the bag and the contents of the mineral brick on its packing.

1.7.2 Centralised Services

1.7.2.1 Management procedures which can confer the economy and power of scale to small and marginal farm families, such as Small Holders’ Cotton and Horticulture Estates, should be popularised.

1.7.2.2 Agriculture and aquaculture service centres run by trained managers who are available to the farmers to provide reliable technical advice, arrange for procurement of quality seed, feed and probiotics, provide information on the market and price fluctuations, should be set up with the active involvement of the farmers in different production areas.
1.7.2.3 Small farmers groups and women’s SHGs involved in livestock rearing need support services like feed and fodder banks, training in scientific rearing techniques, veterinary health care, marketing and credit and insurance.

1.7.2.4 Organized centralized support services are needed to support decentralized small scale fisheries production (e.g. Mother Ships based in Andaman & Nicobar and Lakshadweep group of islands), upgradation and construction of new minor fish harbours and fish landing centers, large wholesale markets for larger and more hygienic handling of catch and greater employment generation.

1.7.3 Rural Energy

1.7.3.1 Farm families need energy both for domestic needs as well as for farm operations. At the moment they depend largely on firewood, cow-dung and agricultural residues for meeting their domestic needs. For agricultural purposes, the major sources are electricity, where available, and diesel. An integrated Rural Energy System is recommended for the purpose of meeting the energy needs of farm families in a holistic manner. Particular attention will have to be paid (a) to harnessing renewable energy technologies such as biogas, wind and solar including solar thermal and solar photo-fuel technology and (b) to conventional energy sources including electricity from grid, kerosene, diesel and soft coke and fuel from social forestry programmes. A Comprehensive Integrated Rural Energy Programme during the 11th plan period is needed for meeting the needs of rural families in their totality. Particular attention should be paid to renewable energy technologies like Biogas Plants, Solar Photovoltaic Technology, Biomass Gasification, Mini Hydro Power and Biofuel Technologies. The availability of energy is also essential for non-farm enterprises including agro processing.

1.7.4 Protective Services

1.7.4.1 Emphasis should be on development of vaccines against diseases for which no vaccines exist at present e.g., bluetongue in sheep. The thrust should be on prevention and eradication of diseases. Disease diagnostic and investigation laboratories should be set up with a separate cadre of appropriately trained personnel.
1.7.4.2 Following the outbreak of Avian Influenza (AI) in some of the Asian / European countries, the Government of India had banned the import of various poultry products. **Quarantine and testing facilities at all ports of entry should be established** before the ban is lifted, as such safeguarding measures are absolutely necessary for the health and survival of the poultry industry and for the protection of livelihood of millions of farmers and others dependent on this industry.

1.7.4.3 A 100% quarantine of all imported birds for a minimum period of six weeks should be strictly implemented, as in countries which have a developed poultry industry.

1.7.4.4 The High Security Animal Disease Laboratory (HSADL) Bhopal is the only laboratory which is equipped and authorized for testing for Avian Influenza. A high level committee of experts may be constituted to test the suspected cases thoroughly before any declaration of bird flu and other major diseases is made, instead of leaving it to the decision of one person. It is also necessary to establish atleast one or two more laboratories equipped on par with HSADL, Bhopal,

1.7.4.5 There is no facility for testing the safety and efficacy of imported poultry vaccines before they are allowed to be marketed, as is there in the case of human vaccines. 90% of human infections and deaths due to bird flu were reported from countries where the birds were vaccinated for Avian Influenza, so imports could be allowed only after testing.

**1.7.5 Support Services for Women**

1.7.5.1 Women suffer from a multiple burden on their time due to their home making, child rearing, and income earning responsibilities. When they work the whole day in fields and forests, they need appropriate support services like crèches and child care centres. Adequate nutrition is also important.

1.7.5.2 The food-for-work programme should enlarge the concept of *work* in the case of women by including activities like running crèches and child care centres, preparing
noon meals in schools, undertaking immunisation of children and providing family planning services.

1.7.5.3 A **Gram Panchayat Mahila Fund** should be established to enable self-help groups and other women’s groups to undertake community activities that help to meet essential gender-specific needs.

1.7.5.4 Credit, insurance, technology development and dissemination, health care, education, input supply, output marketing and rural employment should all be engendered.

1.7.5.5 The feminisation of agriculture, due to male out-migration, needs specific attention with reference to gender-sensitive farm and credit policies. All research, development and extension programmes in agriculture, and all services must be engendered.

1.8 Markets

1.8.1 The gross marketing margin in farm commodities is estimated at Rs.1009 billion, out of which nearly 70% is accounted for by marketing cost. About 77% of marketing costs are estimated to be avoidable losses during handling, storage and transport. Quality, labeling, brands, taxes, subsidies, sanitary and phytosanitary (SPS) issues, price volatility, removal of quantitative restrictions on imports and the absence of a level playing field in international trade due to the very high support (nearly 1 billion dollars per day for 10 million farming families) extended to farmers in OECD countries, are all becoming significant factors in agricultural marketing.

1.8.2 Raising the agricultural competitiveness of farmers with small holdings is a major challenge. Systems designed to confer the power of scale to small farm families both at the production and post-harvest phases of farming are an urgent necessity. Productivity improvement to increase the marketable surplus must be linked to assured and remunerative marketing opportunities. A basket of choices should be available to farm women and men cultivating 1 or 2 ha or below to enhance their income earning capacity.

1.8.3 Pre-production agreements for sale between farmers and corporate houses and processing companies are being increasingly used in the case of certain vegetables, fruits, and medicinal plants. These agribusiness models are being loosely referred to as ‘contract farming’ though in many of these cases there is no formal contract between the farmers and the prospective buyer. The advantage of such arrangements could be biased in favour of the agribusiness organisation. However, there could be beneficial effects of such arrangements to the farmers in the matter of access to adequate and timely credit, good quality inputs, new technology, employment generation, introduction to new crops, separation of production and marketing risks, better farm practices, etc. The need is to develop a comprehensive, clean, equitable and farmer-centric model agreement, which cannot be abused against the farmers. Special care needs to be taken regarding clauses dealing with quality standards, withdrawal conditions, pricing standards, paying arrangements, natural calamities, and arbitration mechanisms.
1.8.4 Swift action is required to overhaul the *rythu bazaars* or farmers’ markets, most of which are presently controlled not by farmers but by traders. Even the “farmers’ markets” are now heavily loaded against the small producers and cartels and trader networks manipulate these and rig prices systematically.

1.8.5 Assured and remunerative marketing for dryland farm products such as pulses, oilseeds, millets, vegetables, fruits, milk, and meat should be put in place. Due to shortage of wheat and rice in government stocks, the Government of India plans during 2006 to purchase millets, ragi, bajra, and jowar for use in the public distribution system (PDS). These "underutilised crops" are rich in micronutrients and minerals and should be referred to as "nutritious cereals" and not as "coarse cereals" as is being done now. The decision to include ragi, bajra, jowar, and other millets in the PDS should be a permanent one. This will help to enhance nutrition security, on the one hand, and the productivity and economic sustainability of improved dryland agriculture, on the other.

1.8.6 Small farmers should not be subjected to experiments in the area of crop diversification without first linking the farmers with the market for the new commodities. Crop-livestock-fish integrated production systems are ideal for small farmers since this can also facilitate organic farming. Success in agricultural progress should be measured by the growth of farmers' incomes and not just by production figures.

1.8.7 While import of wheat, pulses, sugar, and oilseeds may have been necessary during 2006 to prevent an undue rise in prices, we should avoid the danger of making this a habit. Our food budget should be managed with home-grown food, since agriculture is the backbone of our rural livelihood security system.

1.8.8 Farm families should be enabled to become quality conscious, with reference to both home and external markets. Our agricultural competitiveness in the external market can be improved only if we help farm families to increase both productivity and quality of crops in demand in the global market.
Box VII

Basmati Case Study

A case in point is basmati rice exports. Despite the Ministry of Commerce’s notified standards on basmati, several high yielding semi-dwarf stature aromatic rices are being released by research institutions under the name. Such a dilution of the pristine properties of traditional Indian basmati is now seriously threatening our export earnings from basmati rices. Also, traditional basmati varieties are being adulterated with the dwarf “basmati” grains. The appellate basmati is used only for traditional fine grain aromatic rices of great antiquity and of a specific geographic origin. The new high yielding fine grain aromatic rices can be given other appropriate names, since they have good market potential without being called basmati. They can stand on their own merit, without diluting the historic halo which surrounds the traditional Indian basmati rice.

1.8.9 With the liberalisation of procedures, the commodity future market is expanding at a fast pace. The trade turnover in the commodity exchange touched Rs. 5,70,000 crores during 2004-05. The time has come to ensure the healthy and regulated growth of this market and make small farmers benefit from its development. If spot and futures prices of farm commodities are available to farmers as well as to the agro- and food-processing industries, agriculture as a whole will benefit. Farmers given dependable data can take decisions on the crops to be sown and on post-harvest sale of commodities. The Agriculture Produce Marketing Committee (APMC) yards across the country are now being networked electronically by the Multi-Commodity Exchange of India (MCX), Mumbai. The National Commodities and Derivative Exchange (NCDEX) operates online trading through nearly 6000 terminals covering 33 agricultural commodities and linking 430 cities and towns across the country. It will be very useful if the Village Knowledge Centres are linked to NCDEX and MCX so that they can disseminate data on spot and futures price among farmers. It is also now possible to transmit such data on cell phones.

1.8.10 As a national self-empowerment measure, we should establish an Indian Trade Organisation (ITO) and our own boxes for domestic agricultural support on the
model of WTO’s Blue, Green and Amber Boxes. The value of our annual agricultural production including livestock in 2002-03 was Rs. 5,60,516 crore.iii The value of our exports of farm commodities in 2002-03 was only Rs. 34,654 crore (6.18 % of total agricultural production).iv Only a small proportion of our agricultural commodities enter the global market, since with a population of over a billion, there is a large home market. Hence, we must segregate the very modest support we extend to our farmers into two groups: those which are of the nature of life and livelihood saving support to small farm families, and those which could be considered as trade distorting in the global market.

**Box VIII**

<table>
<thead>
<tr>
<th>Markets</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Commodity-based farmers’ organisations like Small Cotton Farmers’ Estates, Small Farmers’ Horticulture Estates, Small Farmers’ Poultry Estates and Small Farmers’ Medicinal Plants Estates should be promoted to combine decentralised production with centralised services such as post-harvest management, value addition and marketing, for leveraging institutional support and facilitating direct farmer-consumer linkage.</td>
</tr>
<tr>
<td>2. Implementation of MSP needs considerable improvement. Arrangements for MSP needs to be put in place for crops other than paddy and wheat, such as millets. Side by side, millets and other nutritious cereals should be permanently included in the PDS. Market Intervention Schemes (MIS) should operate for sensitive crops and a <strong>Price Stabilisation Fund</strong> for all crops should be setup.</td>
</tr>
<tr>
<td>3. Pre-production agreements for sale (contract farming) should be comprehensive, clean, equitable and farmer-centric.</td>
</tr>
<tr>
<td>4. Data about spot and future prices of commodities should be made available to the farming community through the Multi Commodity Exchange (MCD) and the NCDEX and the APMC electronic networks covering 93 commodities through 6000 terminals and 430 towns and cities.</td>
</tr>
<tr>
<td>5. The role of the State Agriculture Produce Marketing Committee Acts [APMC Acts] relating to marketing, storage and processing of agriculture produce need to be reviewed. From regulation they need to shift to one that promotes grading, branding, packaging and development of domestic and international markets for local produce, and move towards a Single Indian Market.</td>
</tr>

---

iv Agricultural Statistics at a Glance 2004, Ministry of Agriculture, Govt. of India
1.9 Mission 2007 – Every Village a Knowledge Centre: Knowledge Management and Dissemination

1.9.1 In its first Report submitted in December 2004, NCF stressed the need for knowledge connectivity in rural India, since farm families urgently need the right information at the right place and at the right time in order to enhance agricultural efficiency and competitiveness. The importance of developing and sustaining two-way flows of information between the farm families and experts/agencies of all kinds was emphasized. The Mission 2007 Alliance whose goal is to build a knowledge center in every village was cited as a means to realize this vision. The need for a national effort to build gateways of digital information for agrarian prosperity was identified and an alliance of data-generating organizations was also recommended, covering the public, the educational and the private sector.

1.9.2 Knowledge Connectivity has been made a key component of Bharat Nirman designed to provide a New Deal for Rural India. The NCF proposal received support in the Union Budget for 2005-06, with the finance minister announcing that the government will allow NABARD to provide Rs. 100 crore out of the Rural Infrastructure Development Fund for supporting Mission 2007 to set up a Knowledge Centre in every village by 15 August 2007, the 60th anniversary of India’s attaining Independence. The NCF welcomes the recent approval of the Cabinet to support the Common Service Centre (CSC) Scheme as a national programme under the National eGovernance Plan. While the Scheme is anticipated to be rolled out in PPP mode, it should be ensured that the principles of social inclusion guide the establishment of the 100,000 CSCs, proactively soliciting support from village Panchayats who would be both the beneficiaries as well as the main stakeholders of the services offered by the Government, the private sector and civil society. In particular, the Fellows of the National Virtual Academy could be helped to emerge as Village Level Entrepreneurs (VLEs).
1.9.3 The following steps are needed to further this thrust:

1.9.3.1 Setting up a series of nation-wide online grids for content sharing in all areas that have relevance to agrarian prosperity through forming an alliance of information sources

1.9.3.1.1 Research and educational and training organizations in our country have for long developed information materials of good quality that are useful for adaptation and use in the VKCs. The challenge however is one of timely access. These sources need to be digitized on a very large scale. The Ministry of CIT, along with several institutes, and the Carnegie Mellon University, has embarked on a large program of digitization of publications and the agricultural, health and Panchayat administration sectors should be covered on a priority basis. Agricultural and health research, development, training and educational organizations should be enabled to digitized their publications for access in the public domain in all Indian languages. The emerging practice of creating grids of information sources should be adopted. The users and facilitators at the VKC should be able to gain access to any relevant document, be it text, image or audio/video clips, irrespective of its origin or original location. The grid content of all kinds should be shareable and re-usable on a mandatory basis without the original creator losing all the copyrights, and new practices such as the Creative Commons should be adopted. The Ministries of Agriculture, Rural development and Health should take steps to initiate such a grid-creation program on a priority basis so that the equivalent of one million pages can be digitized in FY 2007-08. The IIT system has been successful in transforming itself into a consortium of quality-content institutions through the National Programme on Technology Enhanced Learning (NPTEL) program and that experience should be used in the development sector.

1.9.3.2 Forming an alliance of Educational and Training Organizations for Rural Capacity Strengthening to cover at least a million women and men in the next five years

1.9.3.2.1 Strengthening of capacity among rural families is fast becoming an urgent necessity because of the continuing deterioration in natural resources quality, increasing
pressures of trade/markets, and increased incidence of weather-induced uncertainties in production and processing in rural areas. There is a need for capacity strengthening on a mass scale in matters of NRM, weather, trade and quality literacy and in matters related to area-specific disaster-preparedness. The current paradigms of instruction and learning need to be supplemented by new approaches to mass education that requires technology-mediation on a large scale. A blend of non-formal and flexible learning approaches is necessary. An alliance of training and educational organizations should be enabled to use a range of technologies to provide new and effective opportunities for learning in rural areas. The Open Universities, adult literacy organizations, extension wings of SAU’s and rural development agencies should be at the forefront of these activities, while the alliance should also include broadcasting and mass media organizations and technology organizations for deepening reach. Community radio and local publishing are important allies in this endeavor. The experience of the Jamsetji Tata National Virtual Academy in identifying about 500 rural academicians is highly valuable, and these academicians should be considered as the nucleus of the entire process of capacity strengthening on a mass scale. The ISRO-MSSRF project on VRC’s provides a model for the new kind of rural capacity building.

1.9.3.3 E-Governance Processes in Rural Areas and Village Knowledge Centers should be rendered complementary and synergistic

1.9.3.3.1 The country is making significant investments in promoting E-governance and both the Union Government and many State Governments have started to evolve strategy-based plans of action. Studies in the patterns of usage of information in existing VKC’s reveal that nearly half the use is about government and governance information. Therefore, it would be meaningful to create synergies between upcoming E-Governance initiatives in rural areas and the practice of VKC’s. The synergies make both the processes highly effective. E-Governance processes through VKC’s should go beyond provision of government documents or petition-gathering to providing agro-advisories and livelihood-related advice that can be considered by the rural users as authentic. The national Institute of Smart Governance, which is evolving the codes of practices in E-Governance, should be encouraged to develop various scenarios of synergy. Since a
significant component of rural E-governance will relate to disaster preparedness, it would be useful to position the VKC’s as E-governance channels in relation to this aspect.

1.9.3.4 Establish a Technology Resource and Support System for the Promotion of Village Knowledge Centres

1.9.3.4.1 Implementing the foregoing recommendations requires a significant level of technological intensity and development organizations cannot be expected to handle these processes on their own. The Mission 2007 Alliance has fostered a sense of voluntarism among the partners where the technology-oriented partners support the wholly development-oriented ones. This requires to be mainstreamed. Every institution that has advanced skills in IT design/development/instruction/research should be invited to become a participant in a new National Alliance for Development Informatics and Standards, to be hosted in the IIT system. Such an alliance will make fundamental contributions in the area of share ability of content and data across institutional and linguistic boundaries. Such an alliance is also necessary to take advantage of the rapid diffusion of mobile telephony in semi-urban and rural areas, to make it a channel to promote information sharing and learning. Due recognition of such contributions in the form of the equivalent of President of India awards for invention may be considered.

1.9.3.5 Virtual and real communication linkage: Mobilising science and technology for agriculture, through the ICTs needs linking agricultural specialists with farmers through both virtual and real communication. ICTs can bridge the knowledge divide and help to overcome the prevailing knowledge deficit among our farming communities by permitting geographically distributed organizations to work together more effectively, allowing them to provide mutual mentorship and support as demonstrated in the ICRISAT’s VASAT programme. The GoI should replicate the VASAT model in all regions covering all crop, livestock and horticultural practices.

1.9.3.6 ICTs for Agricultural Trade: ICTs have the potential to offer trade opportunities for farmers by linking smallholders into increasingly globalised production
chains. What the ITC’s e-Choupal has gained can easily be replicated by the GoI through the Gyan Choupals in India.

1.9.3.7 **National Agricultural and Farmers’ Knowledge System:** Knowledge is an increasingly significant factor of production. Government could consider establishing a national knowledge management system for agriculture and farmers in all Indian languages that will facilitate interactivity between farmers and specialists; and among farmers themselves. The role of intermediaries is critical for the identification of client needs and suitable knowledge delivery methods and to provide feedback on the quality of agricultural knowledge services. Hence, the GoI should consider working closely with the NVA Fellows who champion knowledge brokerage at the local level, linking the farming community with the rest of the world.

1.9.3.8 **Gyan Choupals to Champion Agricultural Knowledge transfer:** We have already witnessed attempts to establish well-equipped Gyan Choupals (Village Knowledge Centres) with alternative models of connectivity such as the shared and inexpensive mobile phones, DVDs, CD-ROMs and offline internet models. These centres linked to the Village Resource Centres established in collaboration with the Indian Space Research Organisation have already demonstrated the possibilities of connecting farmers with their peers and specialists, a facility inaugurated by the Hon’ble President of India at the Indian Science Congress in January 2006. A combination of VRC and Gyan Choupal can help create, process, disseminate relevant content into agriculture mini-enterprises and support and the delivery of training and skills enhancement among farmers in new technologies. Integrating agricultural content development as well as capacity building for users through Gyan Choupals should be taken up in each and every Panchayat in the country.

1.9.4 **National Level Agricultural Databases**

1.9.4.1 **National Village Level Soil Database:** A database containing the physical, chemical and microbiological details of soil tested in different climatic zones. This will enable the development of mass media campaigns through Gyan Choupals about the
value of soil health and the serious hazards resulting in misuse, leading to rationalization of the use of fertilizer inputs.

1.9.4.2 National Land Information system for Planned Cultivation: A nationwide land information system for planning cultivation patterns must cover cultivatable lands, pasture lands, forests and fallow lands as well as information on land holding of small, marginal and big farmers. This would lead to appropriate strategies for providing the power of scale to small farmers through cooperative, group and self-help group farming methods linking them with contract, corporate, and State farming.

1.9.4.3 National Water Management Information System: A GIS based water information system with village level disaggregated data will enable assessing the level, status and quality of ground and surface water resources, and various water harvesting methods ranging from water aquifer recharge structures to roof-top rain water harvest. Under the Rural Employment Guarantee Scheme, local people can help map these resources and form part of a water literacy campaign using e-learning and mass media material through Gyan Choupals.

1.9.4.4 National Seed Information System: An information system for quality seed to track production, preservation and distribution will facilitate the timely procurement of quality seeds and the maintenance of seed banks and seed grids all over the country depending upon the geographical priority. This database will also help to analyse diseases and pests that affect the yield and in monitoring the use of plant protection chemicals.

1.9.4.5 National Agro-processing and Marketing Information System: An agro-processing database in Indian languages would aim to provide adequate knowledge to groups of farmers on post-harvest technologies and ICT-enabled demonstration of various tools and techniques used in agro-processing, value addition and packaging. Farmers can move from mere producers to small-scale entrepreneurs especially in food processing.
1.9.4.6 National Credit and Insurance Information and Advisory System: The linked credit plans adopted by the agricultural banks and financial institutions will need to be supplemented by strong credit information, advisory services and credit counseling to ensure social inclusion, and participation of rural poor in such schemes. A database system with sector wise information will help in developing strategies for micro-insurance schemes. Such schemes will have the potential to expand to plants, perishable commodities, animals, weather and water resources.

1.9.4.7 National Local Heritage Databases: Databases to redeem the dying practices and knowledge to ensure that the indigenous knowledge of crops, livestock and cultivation processes and methodologies are captured. A living heritage gene bank of local breeds like cattle, sheep and poultry, with pedigree information would help in protecting the genetic wealth of Indian animals and in creating a brand name based on community-based conservation methods for these species. Gyan Choupals will be the perfect vehicles for protecting the local heritage by involving the community knowledge workers, especially women, and in tribal areas.

1.9.5 With the participation of NGOs, government research agencies and the international institutions such as ICRISAT, FAO and IFPRI a national agricultural gateway to develop, adapt and disseminate digital content on agriculture and farming practices can be developed.

1.9.6 A new cadre of agricultural knowledge workers attached to Gyan Choupals and linked to the Village Resource Centre has to be created on a priority basis. India needs half a million such champions to help our farmers. These champions will play a critical role in providing feedback to specialists and at the same time provide the much-required link with farming communities. These steps will help to generate more than a million skilled jobs in rural India, since at least one woman and one man will be involved in the management of a Gyan Chaupal.
CHAPTER 2

MAKING HUNGER HISTORY

Medium Term Strategy for Food and Nutrition Security with a view to move towards the goal of universal food security over time

2.1 The Mid-term appraisal of the Tenth Plan reveals that we are lagging behind in achieving the Millennium Development Goal of halving hunger by 2015. Undernutrition and malnutrition are still widespread. National Sample Survey (NSS) data show a clear trend of decline in calorie intake. In rural India, the average calorie intake per capita per day fell from 2266 Kcal in 1972-73 to 2183 Kcal in 1993-94. It fell further to 2149 Kcal in 1999-2000. Among the lowest 30% of rural households in respect of consumer expenditure, the per capita calorie intake fell from 1830 Kcal in 1989 to 1600 Kcal in 1998. In 1999-2000, almost 77% of the rural population consumed less than the poverty line calorie requirement of 2400 Kcal. The average calorie intake in 2004-05 across the eight States of Kerala, Karnataka, Tamil Nadu, Andhra Pradesh, Madhya Pradesh, Orissa, Maharashtra and West Bengal was only 1907 Kcal as per provisional data released by the National Nutrition Monitoring Bureau (NNMB), indicating a declining trend. Further, 35.5% adults in these States, suffered from Chronic Energy Deficiency and 54.4% children in the age-group 1-5 years were undernourished with 16.5% suffering from severe under-nutrition. Maternal and foetal under-nutrition results in the birth of babies with low birth weight which reinforces itself in the absence of corrective measures.

2.2 Hunger Hotspots

2.2.1 The National Institute of Nutrition (NIN) Survey 2002, collected detailed data for different age groups based on the Recommended Daily Allowance (RDA) specified by the Indian Council of Medical Research (ICMR) for specific age and sex groups, including extra energy needed for special groups such as expectant and lactating mothers. There are 7 age and sex groups for which calorie intake data has been collected and compared with the recommended daily calorie intake for that age and sex group. The data
is however available for only 9 States of the country, excludes large populous States such as UP although UP is in the list of NNMB States for nutrition monitoring and refers only to rural area of these States. The findings of the study in respect of median calorie intake\(^1\) of the States for each of the 15 age and sex groups compared to the respective RDA are given in the Table 1 in Annexure 2.1. With very few exceptions, the median calorie consumption is far below the RDA levels in all the States for all groups. In all the age groups of children: 1-3 yrs, 4-6 yrs, 7-9 yrs, the RDA is higher than the median calorie intake in all the nine States, with Gujarat, Orissa, Tamil Nadu and Kerala recording the lowest levels. With regard to pregnant women and lactating mothers the median is below the RDA in seven States, the scenario for pregnant women being the worst in Kerala and West Bengal and for lactating mothers, in Tamil Nadu, Madhya Pradesh and Maharashtra.

2.2.2 The NNMB data being partial in coverage (leaving out many States where the hunger situation might be worse) and being State level data, these are not particularly helpful in identifying hunger hotspots in the country. Another source of data on food intakes and energy levels is the India Nutrition Profile (INP), last published by the Women and Child Development Department of the GOI in 1998. This also has the limitation of partial coverage, in that it is confined to a few States. However, it has the merit of providing district level data. Since it is unlikely that dramatic changes for the better would have occurred in respect of nutrition between 1998 and now, one may also use the INP data to throw light on some hunger hotspots in the country. Using INP 1998 data, the attached tables 2 – 4 in Annexure 2.1 provide a list of the districts of the States of Assam, Bihar, Haryana, Punjab and Rajasthan, which report a mean level of the relevant variable (intake of cereals and pulses in grams per consumption unit per day, energy level in kilocalories per consumption unit per day) below the RDA specified by the ICMR. It can be seen that the situation is especially serious in terms of the intake levels of pulses.

\(^1\) The median value is that value below which half the population lies. In other words, the implication is that more than half the population in each of the concerned age groups in the States mentioned, has an intake below the RDA.
2.2.3 The above findings are forebodings of serious consequence for the future physical and intellectual capital of India and need to be heeded posthaste. The consequences of child under-nutrition for morbidity and mortality are enormous. Child malnutrition is responsible for 22 percent of the country’s burden of disease. The minimal loss to GDP due to Vitamin and Mineral Deficiency (VMD) malnutrition per year is reportedly Rs. 27,720 crores. In such a scenario, addressing food and nutrition security and building a sustainable food and nutrition security system have to be flagged as urgent tasks for sustained economic progress.

2.3 Food and Nutrition Security

2.3.1 The concept of food and nutrition security implies that -

i) every individual has the physical, economic, social and environmental access to a balanced diet that includes the necessary macro- and micro-nutrients, safe drinking water, sanitation, environmental hygiene, primary health care and education so as to lead a healthy and productive life.

ii) food originates from efficient and environmentally benign production technologies that conserve and enhance the natural resource base of crops, farm animals, forestry, inland and marine fisheries. (Science Academies Summit, MSSRF, 1996)

2.3.2 This comprehensive definition of food and nutrition security provides guidelines for developing an effective operational strategy for achieving the goal of freedom from hunger.

2.3.3 Hunger has three major dimensions:

i) Chronic or endemic hunger resulting from poverty-induced undernutrition.

ii) Hidden hunger arising from micro-nutrient malnutrition, caused by the deficiencies of iron, iodine, zinc and vitamins in the diet.

---

2 [http://wcd.nic.in/statewcd](http://wcd.nic.in/statewcd), presentation of Dr Saraswati Bulusu, Micronutrient Initiative India, April 2006
iii) **Transient hunger** caused by seasonal fluctuations in food availability and disruptions in communication and transport arising from natural or manmade disasters.

### 2.3.4 A sustainable national food and nutrition security system should cover all these three categories of hunger. It must also address the three issues of availability, access and absorption.

i) **Availability** of food at the household level depends upon (a) food production, and the operation of a resource-poor consumer-friendly Public Distribution System (PDS) operated with homegrown foodgrain stocks and or imports.

ii) **Access** to food depends on livelihoods / purchasing power.

iii) **Absorption** of food is influenced by access to clean drinking water, environmental hygiene and primary healthcare.

In recent years, there is cause for concern on all the three counts of food availability, food access and food absorption.

### 2.3.5 Food Availability

2.3.5.1 In the nineties, foodgrain growth rate has slowed down drastically to 1.7% and has fallen below the population growth rate of 1.9%, so that per head annual net foodgrains output has fallen by about 3.5 kg from a peak of 180 kg. in the three years ending in 1994-95 to, 176.5 kg. by the three-year period ending in 2000-01. (Utsa Patnaik, [www.macroscan.org](http://www.macroscan.org), August, 2002). The situation has not improved significantly since then.

2.3.5.2 The decline in per capita net availability of cereals and pulses over the last 15 years (from 510 grams per capita a day in 1991 to 463 gms in 2004) has been unprecedented. Estimate of requirement of cereals in 2020, range from 224 million tonnes to 296 million tonnes[^3]

[^3]: Bhalla, G S, P Hazell and J Kerr (1999), Prospects for India’s Cereal Supply and Demand to 2020, IFPRI Discussion Paper 29, Washington DC, USA
2.3.5.3 The High level Committee on Long Term Grain Policy, 2004\(^4\), arrived at a projection of 260 million tonnes, i.e. production will have to increase by 69 million tonnes from the present level of 191 million tonnes, i.e. doubling of the current rate of production. **The decline in per capita foodgrain availability and its unequal distribution have serious implications for food security in both rural and urban areas.**

2.3.5.4 In 1999-00, the *average* calorie consumption of a consumption unit in urban areas was 2637 kcal/day, not much higher than the norm of 2100 kcal/day, set for an urban adult. It is especially important to note that while there are visible signs of an enormous increase in conspicuous consumption by the urban rich, there are also signs of increasing inequality in urban areas - in 1999-00, the bottom 10 percent of urban population obtained on the average only 1890 kcal/day. That is, nearly 28 million people in urban areas have unacceptably low levels of calorie consumption. (Food Insecurity Atlas of Urban India, MSSRF-WFP, 2002)

2.3.5.5 The Planning Commission had earlier estimated the proportion of population below the poverty line at 27.09 percent in rural areas and 23.62 percent in urban areas in 1999-2000. However, these highly contested estimates now stand revised. The Draft Approach Paper for the 11\(^{th}\) Plan notes that the proportion of households below the poverty line was as high as 28% in 2004-05 as per the most recent NSS full sample round. This is close to 300 million persons. The problem at hand is therefore of enormous dimensions. Besides, there are regional variations as well in the incidence of poverty. Across the nation, the poorest States are Orissa, followed by Bihar, Madhya Pradesh and Assam.

2.3.5.6 Though official data on poverty suggest a reduction in the percentage of population below the poverty line, there is reason for presuming that the incidence of hunger is increasing. Data on nutritional intakes suggest that income poverty is increasingly divorced from the calorie norm of 2400 kcal per consumption unit per day underlying the original official definition of poverty line. The data show that the

---

\(^4\) Abhijit Sen Committee
percentage of population consuming diets providing less than 2400 kcal per capita per day is much higher now than the percentage below poverty line as estimated by the Planning Commission. Recent work by Professor V S Vyas\(^5\) suggests that in as many as eight major States, the proportion of the rural population accessing less than 1800 kcal/day (the level below which malnutrition can cause irreversible damage) exceeds 30 percent. This is indeed cause for concern.

2.3.5.7 **Farmers as Consumers**: An important feature of the Indian situation in the area of nutrition security at the level of each individual is that the producers of agricultural commodities i.e., farm men and women, constitute the majority of the population. Hence, the nutrition security of farmer-consumers becomes important to achieve the goal of hunger-free India. As mentioned earlier, in 1999-2000, almost 77% of the rural population consumed less than the poverty line calorie requirement of 2400 calories. Low productivity and income appear to be the single most important cause of endemic under- and malnutrition among farmer-consumers.

2.3.6 **Food Access**

2.3.6.1 Access to foodgrains is related to the purchasing power of the population and the nature of public distribution system that is prevalent. Purchasing power of large sections of the rural population has been weakened in recent years by the crisis in agriculture and rural livelihoods. In urban areas, the weakening of the PDS has exacerbated the problem of food insecurity.

2.3.6.2 **Rural Food Insecurity**

i) Several studies have shown that the poverty is concentrated and food deprivation is acute in predominantly rural areas with limited resources such as rain-fed agricultural areas. Agricultural labour and migrant labour are susceptible to hunger. In India, of the 310.7 million rural workers, 103.12 million are agricultural labourers. Of these, about 48.37 million are females. Female agricultural labourers are especially vulnerable to food insecurity on account of lower wages as well as the

\(^5\) Vyas V S, Moonis Raza Memorial Lecture, New Delhi, April 4, 2005
effects of migration. One-third of the rural work force is dependent on casual employment. This segment faces uncertainties of wage and work and is highly susceptible to food deprivation.

ii) About 40.14 percent of the rural workers are cultivators. Of the total 124.68 million cultivators, about 40.64 million cultivators are women with inadequate resources and credit facilities. In hilly areas and rain-fed under developed areas, often there are more female cultivators than male cultivators. Besides rural agricultural and non-agricultural labourers, small and marginal farmers also face food insecurity. Not only do they not get remunerative prices for their produce, they are also affected by the rise in retail/PDS foodgrain prices, being net buyers of grain. Input costs are constantly going up, while output price does not show commensurate rise.

2.3.6.3 Urban Food Insecurity

i) It is often presumed that, since urban areas are covered by the PDS, food security is not a major issue in urban areas. This is not true. During the 1990s, the PDS has been weakened, both by repeated increases in the issue prices of foodgrains and by the switch to a system of targeted PDS. Studies show that the bottom 10% of the urban population is not really helped by the prevalent system of PDS for accessing foodgrains. In 1999-00, average cereal consumption of bottom 10% of urban population was 9.55 kg/month in urban India. Of this, less than one kg/month was accessed from PDS (Food Insecurity Atlas of Urban India, MSSRF-WFP 2002).

ii) This brings out the need to have a system of PDS that is flexible so as to ensure larger coverage. People should be able to access grains from PDS whenever they want, wherever they want and in any quantity they want, subject to a few ground rules to prevent purchase for hoarding and subsequent sale at high prices. That is, flexibility with regard to time, place and quantity of purchase needs to be fitted in to the PDS. Accessing subsidized foodgrains is absolutely essential not only for the settled urban poor but also for the migrant population from villages.

---

6 See Annexure 2.2
iii) As for purchasing power, the quality and quantum of employment of the population determine their income earning ability and therefore their ability to purchase foodgrains in the market. Casual employment normally fetches an income that is low and irregular; regular employment on a decent wage ensures a relatively better access to food. In 1999-00, in urban India only 4 out of every 10 workers belonged to the regular wage category; among the bottom 10 percent of urban population, nearly 4 out of 10 persons are casual labourers. The nature of the employment problem varies across different size classes of towns. Proportion of casual labour among males as well as females is much higher in small towns compared to the metropolitan cities or big towns. Similarly, the proportion of workers in regular employment is much lower in small towns compared to bigger towns. (Food Insecurity Atlas of Urban India, MSSRF-WFP, 2002)

iv) Given the magnitude of the employment problem in urban India, particularly in the small towns, there is a strong case for a National Urban Employment Guarantee Programme, as part of the New Deal for Urban Areas. Such an Employment Guarantee Programme could be used for activities like sanitation, pollution control, tree planting and protection, energy generation from wastes and compost making.

2.3.7 Food Absorption

2.3.7.1 Biological absorption of food in the body is related to the consumption of clean drinking water as well as environmental hygiene. The situation on this front is serious in India. For instance, in urban areas –

i) Slums that have inadequate facilities of sanitation and drinking water provide shelter to nearly 22% of urban population in the country. In the early nineties, one third of slums did not have any drinking water facility and nearly half the slums did not have toilet facilities.

ii) Access to basic amenities - safe drinking water, toilets, electricity, are much lower for households living in small towns.
iii) In 1998-99, 15.4 % of children were severely stunted and 11.6 % were severely underweight.

iv) While there are wide variations in the nature and extent of the problem of food insecurity across urban areas, small towns are especially vulnerable.

v) Diseases like HIV/AIDS, Tuberculosis and Malaria are spreading

2.3.7.2 A National Food Security System should therefore give concurrent attention to the landless poor in villages and to casual and migrant labour families in urban areas.

2.4 Hunger-Free India: Components of Action Plan

A six-point Action Plan is suggested below for achieving the goal of Hunger-Free India.

2.4.1 Reform of the Delivery System:

2.4.1.1 The overall approach should be life cycle based and involve appropriate supplementation programmes. The delivery systems relating to all nutrition support programmes must be restructured on a lifecycle basis, starting with pregnant women and 0-2 infants and ending with old and infirm persons. An illustrative list of the programmes, which will benefit from a lifecycle based delivery system, is given in the Table below. Elected Panchayats and local bodies should be involved in restructuring the delivery system. All these programmes should be implemented throughout the country.

Table 1: Current Status of Interventions

2.4.1.2 With regard to the PDS, it is high time we went back from the TPDS to a universal PDS with uniform prices. The allocation per household in the PDS should be based on the number of consumption units in the household. The cost implications of universalizing the PDS are given in the box below.

Box I

**IS UNIVERSAL PDS ECONOMICALLY FEASIBLE?**

1. Let us assume that the PDS is made universal in the sense of reaching around 80 per cent of our population who are either malnourished or at the risk of malnutrition, that is, food insecure. The PDS should only exclude (if necessary by self selection or voluntarily) the richest 20 per cent of our population. So the target group is about 800 million persons.

2. Let us assume that 80 per cent of the population is given the present BPL allocation and price, that is, 35 kg of grain at the subsidized price of Rs 4.15 for wheat and Rs 5.65 for rice.

3. If the economic cost is Rs 1286 per quintal of rice and Rs 983 per quintal of wheat (estimates for 2005-06 in the Economic Survey), then the unit subsidy is Rs 7.21 per kg of rice and Rs 5.68 per kg of wheat.

4. If 800 million persons are to be included, it can be assumed to be 160 million families (average of 5 persons per family).

5. So, first, the grain requirement for the PDS will be 160 million times 35 kg (ceiling) or 56 million tonnes. In 2005-06, the PDS offtake was 49.7 million tonnes (including Antyodaya), so this is quite feasible. (In 2004-05, the offtake was 30 million tonnes).

6. The cost of the food subsidy, assuming all the grain is distributed at the same price will be

   - For 30 million tonnes of wheat: Rs. 17,040 crores
   - For 26 million tonnes of rice: Rs. 18,746 crores
   - Total: Rs. 35,786 crores

The above estimates of a grain requirement of 56 million tonnes and a subsidy of Rs 35,000 crores is an overestimate since all 160 million households are unlikely to purchase 35 kg of grain a month.

Further, the total subsidy works out to just a little over 1 per cent of GDP. If the tax to GDP ratio, which has fallen since 1991, can be raised by 1 percentage point, then this can be easily financed. This expenditure will be more than compensated by the rise in national income arising from higher productivity as a result of eliminating endemic hunger and malnutrition.

Source: Dr. Madhura Swaminathan, ISI Kolkata
2.4.1.3 Besides foodgrain, other essential commodities such as pulses, edible oil, cloth, salt and other essential items of daily consumption should also be distributed by the PDS. This will also help ensure the viability of the PDS outlet. Ration shops should be strengthened and made viable through the provision of appropriate margins or subsidies. To ensure effective utilisation of the PDS by the public, the PDS outlets must remain open on all days. Further, the public must be free to draw their allocations on a weekly basis. Migrants should be able to access PDS allocations in the area where they work.

2.4.1.4 The centralisation that took place under the TPDS should be reversed and State governments should, in the first instance, have the right to determine the required allocation under PDS for their State. PRIs may also be actively involved in the monitoring of the PDS. Women SHGS supported by micro-credit could operate the PDS, wherever possible.

2.4.2 Community Food Security Systems

2.4.2.1 While a universal PDS and appropriate supplementary programmes funded by the government are critical to ensuring food security, there is also an important role for community based food security systems, such as Community Foodgrain Banks (CFB). Community food security systems appear especially relevant in socially cohesive communities characterised by limited income inequality and in locations, which find it difficult to access other delivery mechanisms such as PDS. To ensure sustainability, such initiatives may work closely with elected local bodies. Policy must promote the establishment of Community Grain and Water Banks, involving Panchayats and other local bodies. This programme should be based on the principle “store grain and water everywhere”.

2.4.2.2 The Community Grain / Food Bank system will help to widen the food security base by including a wide range of millets, grain legumes and tubers. While these can be operated by the nearly 240,000 Panchayats and Urban Local Bodies in the country, using flexible implementation mechanisms suited to local needs, the programme should financially supported and regulated by the State to ensure social
inclusion and sustainability. The steps involved in setting up and operating CFBs has been described in detail in Chapter II of the Second Report of the NCF (NCF Second Report, August 2005).

2.4.2.3 There is an urgent need to promote the growth of community water security systems based on a 5-pronged strategy consisting of:

i) Augment supplies through mandatory water harvesting and conservation

ii) Give attention to demand management by eliminating all sources of unsustainable use of water and promoting “more crop and income per drop” methodologies of crop cultivation

iii) Harness new technologies relating to improving domestic water use efficiency, de-salination of sea water, breeding of drought and salinity tolerant crop varieties, bioremediation, etc.

iv) To begin with, each district in the country could develop a sustainable water security system. Community action should however start at the village level.

v) Promote seawater farming through integrated agro-forestry and aquaculture production systems in coastal areas.

vi) Pay attention to water quality. The quality of drinking water is deteriorating due to pesticide and bacterial contamination in ground water. Equal attention should be paid to the improvement of drinking water quality and the augmentation of water supplies. Bioremediation techniques will have to be used for removing arsenic and heavy metals from tube well water.

2.4.3 Eradication of hidden hunger

2.4.3.1 Hidden hunger caused by micronutrient deficiencies must be addressed based on natural food cum food fortification approaches. For example, salt fortified with iron, iodine, minerals and vitamins, coupled with the consumption of beta-carotene rich sweet potato or vegetables will be very helpful to fight hidden hunger. Local SHGs can be trained to make nutritious biscuits as an income earning activity. Nutritional literacy should be promoted at the school level. High priority should go to the elimination of iron deficiency anaemia among pregnant women. The following basic recommendations are made in this regard:

- Food security is a prerequisite for nutrition security. Hence steps taken for mitigation of micro nutrient malnutrition should also simultaneously address Protein Energy malnutrition.
• While food and nutrition insecurity need to be addressed at all stages of life cycle, certain groups such as pregnant and lactating mothers, adolescents and children under three years of age need to be given special attention because of their physiological needs.

• Food and nutrition security needs to be addressed through integrated complementary strategies, namely dietary diversification, supplementation, food fortification and community and public health measures, along the following lines:

  - *Enlarging the Food Basket* – Many millets and other underutilized crops like tubers are rich in micro-nutrients as can be seen in table 2.2 below. They should hence be included in the PDS.

Compared to Rice:
- **Ragi** is > 34x (times) in Calcium, 5x in Iron, 2x in Phosphorus, 2x minerals
- **Little millet** is 12x in Iron, 1.5x in Calcium and Phosphorus
- **Foxtail millet** is 5x in Minerals, 3x in Calcium, 4x in Iron

- *Dietary diversification* – increased availability of fruits and vegetables through horticulture interventions.

- *Supplementation* – rather than neglecting / abandoning the programmes that are poorly functioning, (such as iron and folic acid supplementation) we need to strengthen them systematically.

- *Food Fortification* – Iodine supplementation through iodized salt should be strengthened to ensure universal availability and accessibility and should be channelized through PDS, MDM and ICDS. Staple food should be given priority for fortification.

- *Community and public health measures* - Since nutritional security is influenced by healthcare, safe water and sanitation, these must be ensured through adequate public health measures.
- Special attention to pandemics like HIV/AIDS – There are indications that the incidence of HIV/AIDS and tuberculosis is increasing in rural India. The supply of free drugs should be extended to villages in order to contain the spread

2.4.3.2 The quality of service delivery needs to be improved. The ICDS is a very critical intervention programme and the *anganwadi* worker plays a key role in the convergence of services for the mother and the child under six years of age. She should be recognized as a regular full time employee with specific skills and her remuneration should be revised accordingly.

2.4.4 New Deal for the Self-employed

2.4.4.1 Between 1993-94 and 2004, the current daily status unemployment rate rose from 5.6% to 9.0% for rural males and from 5.6% to 9.3% for rural females. The corresponding urban increases were from 6.7% to 8.1% for males and 10.5% to 11.7% for females.

2.4.4.2 Rural employment grew at 0.67% and agricultural employment at 0.02% between 1993-94 and 1999-2000. According to the 55th round of survey of NSSO, the share of self-employed in 1999-2000 was about 53%. Of the self-employed, 58% (133 to 134 million) were in the primary sector, i.e., agriculture and allied activities.

2.4.4.3 Detailed analysis of the causes of food insecurity in rural and urban India have revealed that inadequate purchasing power due to lack of job/livelihood opportunities is now the primary cause of endemic or chronic hunger in the country. Since opportunities for employment in the organized sector are dwindling, we have to create a policy environment that enlarges opportunities for remunerative self-employment in rural India in order to avoid an era of jobless, or worse, job-loss economic growth.

2.4.4.4 It follows from our brief review of the employment scenario during the period of economic reforms that the policies of indiscriminate liberalisation, privatisation and globalisation, which, have contributed a great deal to the rural and agrarian crisis, should be reversed. The economic policies should be reoriented to provide adequate support for India’s agriculture and its vast rural population. In particular, policies must provide
adequate rural infrastructure and promote employment, besides ensuring credit facilities and remunerative prices for produce for our farmers.

2.4.4.5 The unfinished agenda of land reforms must be completed including, distribution of ceiling surplus land and attention to common property resources such as public land and water. There should be substantial increase in public investment in agriculture-related infrastructure such as irrigation and drainage, land development, water conservation, development of road connectivity etc. Such investments are specially needed in the poorer and low rainfall areas of the country.

2.4.4.6 Substantial investments need to be made in health and education especially for the rural population. This, along with reversal of macroeconomic policies so as to enhance aggregate demand, will enhance the prospects of the growth of rural employment.

2.4.4.7 Agriculture, comprising crop and animal husbandry, fisheries, forestry and agro-forestry and agro-processing, is the largest private sector industry in India, providing livelihood opportunities for over 600 million women and men. There is need to intensify efforts to create more opportunities for gainful livelihood opportunities in both the farm and non-farm sectors. According to FAO, malnutrition is high in areas where a very high percentage of population depends solely on agriculture for their livelihood. One reason for the high prevalence of hunger in villages is inadequate growth in opportunities for remunerative non-farm employment.

2.4.4.8 The menu of income earning opportunities for the self-employed needs to be enlarged. This calls for a paradigm shift from micro finance to livelihood finance. Micro-credit Banks should be developed into Sustainable Livelihood Banks (SLB), through backward linkages to technology and credit and forward linkages with management and market. NCF had recommended in its first report that all the existing Krishi Vigyan Kendras (KVKs) should be provided with a post-harvest technology wing. In addition, there is an urgent need for at least 50 SHG capacity building and mentoring centers in every State, to enhance the management and marketing capacities of members of the SHGs. Such centers can be established in existing institutions like
Agricultural, Rural and Women’s Universities, IITs, institutions operated by NGOs, etc. Village Knowledge Centres can provide SHGs with e-commerce facilities. Accounting software will have to be introduced. SHGs will be sustainable in the longer term only if they have backward linkages with technology and credit, and forward linkages with management and marketing. Sustainable Self-help Groups (SSHGs) will emerge only if we build the capacity of the key members (both women and men of SHGs). The **SHG Capacity Building and Mentoring Centres** may be financially supported by the Union Ministry for Rural Development. This should be an essential component of the **New Deal for the Self-employed**.

### 2.4.4.9 Regarding the livestock sector

There is a need for establishing a **Livestock Feed and Fodder Corporation** to assist communities, including SHGs, to produce good quality animal feeds. These may also develop into bodies, which provide seeds and planting material of improved varieties for local production. The production can be sourced and supplied by decentralized Community Feed and Fodder Banks. At present, such banks which are of great use during calamities like drought, are generally not accessed during normal season when green fodder is available in plenty, making their operation non-viable. This can be avoided by linking their operation with complete feed production units at the village level managed by veterinary graduates that will also provide local employment. The feed units should source inferior quality biomass such as dried grass from forests or agricultural by-products like paddy straw, sugarcane bagasse and mix them with concentrate and feed additives to enrich the nutritive value and compact into bricks or blocks. Special feed can be prepared for different categories of animals, growing and milching animals, dairy sector etc, depending on the local demand. Such village level complete feed production units are in vogue in Israel and can be a boon for the landless in our country to access quality fodder. The unsold fodder from the Feed and Fodder Banks can be converted into complete feed for supplying to needy farmers not only in the locality but also other areas including peri-urban areas where large numbers of landless maintain livestock. The Banks can also have linkages with procurement agencies and district administration for supplying surplus feed to needy agencies.
2.4.4.10  Agri-clinics operated by veterinary and farm science graduates can help enhance the income of dairy farmers through higher productivity. This can also help improve the nutritional value of the food basket of our population.

2.4.5  Enhancing the Productivity and Profitability of Small Holdings

2.4.5.1 Nearly 80% of the land holdings in India are below 2 ha in size. Unlike in industrialized countries where only 2 to 4% of the population depends upon farming for their work and income security, agriculture is the backbone of the livelihood security system for 2/3 of India’s population. Therefore, farmers constitute the largest proportion of consumers. The smaller the farm, the greater is the need for marketable surplus in order to get cash income. Hence, improving small farm productivity, as a single development strategy, can make the greatest contribution to the elimination of hunger and poverty.

2.4.5.2 Indian soils are both hungry and thirsty. Hence, soil health enhancement and irrigation water supply and management hold the key to the enhancement of small farm productivity. The following steps are urgently needed:

i) National network of advanced soil testing laboratories with facilities for the detection of micronutrient deficiencies. As a single agronomic intervention, supply of the needed micronutrients in the soil has the greatest impact on increasing yield. Hidden hunger is as widespread in soils as in human beings. In fact, the two have causal relationships.

ii) Million Wells Recharge Programme

iii) Restoring water bodies and promoting mandatory water harvesting.

iv) Establishment of 50,000 Farm Schools to promote farmer-to-farmer learning.

v) Organisation of Small Farmers’ Horticulture, Cotton, Poultry, aquaculture and other Estates, to promote group farming and to confer the power of scale to small producers both at the production and post-harvest phases of farming.
2.4.5.3 Farming is becoming a gamble both in the monsoon and the market. Hence small farmers urgently need proactive advice on land and water use. Land use decisions are also water use decisions. For this purpose, State Land Use Boards should be restructured, retooled and reactivated on the lines indicated in Fig 1. *This is a task of the utmost priority.*

2.4.5.4 The *Every Village a Knowledge Centre or Gyan Chaupal* movement can help to give farmers dynamic advice on meteorological, management and marketing factors.

2.4.5.5 We suggest that the following areas may receive priority in technology support:

i) Short and medium term weather forecasting, in order to assist Land Use Advisory Boards to give proactive advice to farmers on crop and varietal choice.

ii) Rapid and low cost soil testing technologies based on nanotechnology. This will enable the application of need based macro- and micro- nutrients. Factor productivity in relation to fertilizer application is low now and this enhances the cost of production. The average fertilizer response of food grain output to NPK utilization works out to 7.8 kg grain per kg of NPK. This is a very low return.

2.4.5.6 Unless factor productivity is increased, small farm agriculture will become un-remunerative. This is one of the causes for a high percentage of farmers wanting to quit farming. We must recognize the need for increasing the productivity and profitability of small and marginal farms, in order to eliminate endemic and hidden hunger in the families such farmers. The following specific recommendations are made in this regard:

- Step-up public investment in irrigation and rural infrastructure and provide other forms of State support including credit and post-harvest storage and processing

- Provide credit on reasonable terms; accept NCF recommendation of 4 per cent interest rate on agriculture loans. Target credit to the marginal, small, and medium farmers and adopt an integrated credit cycle approach.
• Strengthen the S&T and R&D systems in agriculture to generate and disseminate small farmer friendly technologies, including with respect to seeds, other inputs, water harvesting and machinery, using the KVKs, VKCs etc…

• Ensure the availability of quality inputs at reasonable prices, by putting in place an appropriate regulating system and strengthening extension.

• Expand the MSP system, based on the cost of production including reasonable rate of return on investment and ensuring a prompt and open-ended purchase for all major crops.

• Cover small farmers adequately through effective crop insurance schemes using the revenue village as the unit.

• Encourage research on technology for dry-land farming and make these technologies available to small and marginal farmers. The recently established National Rain fed Authority can have as its sole mandate the launching of a second green revolution in dry farming areas beginning with pulses and oilseeds.

• Promote water security through sustainable water use and rainwater harvesting.

2.4.6 Designing and introducing a Food Guarantee Act

2.4.6.1 We have over a century of experience in organizing relief work, under the provisions of the Famine Code in the colonial period, and Food for Work programmes in the post-independence period. It is clear that our agriculture has reached a stage when farmers will grow more only if we can consume more. A National Food Guarantee Act, combining the features of the Food for Work and Employment Guarantee Programmes, will represent a win-win situation both for producers and consumers. Following up on the NREGA and recognising that the right to food and the right to livelihood are intimately related, we need to move towards a comprehensive “Food Guarantee Act”.

2.4.6.2 A National Food Guarantee Act should lead to a decentralized network of grain storage structures and thereby help to prevent panic purchase of foodgrains during periods of drought or flood. They will also help to prevent distress sales by producers at the time of harvest. In addition, it will help to enlarge the composition of the food security basket.
2.4.6.3 Brazil, Kenya and a few other countries have announced, “Zero Hunger” programmes. **India can take the lead to give meaning and content to the zero hunger concept, by developing a National Food Guarantee Act.**

2.4.6.4 The major features of a National Food Guarantee Act were discussed at a Consultation held at the M S Swaminathan Research Foundation (MSSRF), Chennai, on 19 June 2005. The participants made the following suggestions:

- The main aim of the proposed legislation should be to integrate the features of Employment Guarantee Acts (National and Maharashtra) and Food for Work Programmes, in order to ensure that every child, woman and man has physical, economic, social and environmental access to balanced diet, clean drinking water and primary health care. This is fundamental to providing every individual in the country an opportunity for a healthy and productive life. Rural and urban populations as well as migratory labour families will have to be covered. Social inclusion should be the bottom line.

- The National Food Guarantee Act should be gender sensitive. The concept of “work” should be enlarged to cover also skilled work related to human and social development, such as, for example, establishing and running crèches, balwadis, preparing noon meals, etc.

- Payment of a part of the wage in the form of foodgrains has the double advantage of helping farmers in the area of marketing, and consumers in the form of obtaining their basic caloric requirements in the form of good quality foodgrains at a reasonable price. This will also help to enlarge the composition of the food security basket.

- Food guarantee can become a reality only if there is an implementation mechanism characterized by low transaction cost, transparency and freedom from corruption. The Gram Panchayats / elected local bodies may be able to provide such a mechanism. The Gram Panchayat / Local Body can form in the respective villages a Consortium of Agencies like SHGs, Mahila Mandals, Farmers’ Clubs etc, to provide oversight to the implementation of the integrated food for work and employment guarantee approach to the
elimination of hunger and poverty. **The Panchayat can thus provide a platform for partnership at the grass root level.** However Panchayats will need the necessary legal, financial and technical empowerment. There are a large number of tasks, which are assigned by Constitution Amendment 73 to Panchayats, but they have no capacity to discharge these responsibilities since they have not been legally or financially empowered to do so. Capacity building of women and men Panchayat members in undertaking such tasks has to proceed concurrently with financial empowerment.

- Information empowerment on entitlements is vital for success. Household entitlement cards can be distributed and full use could be made of Mission 2007: Every Village a Knowledge Centre Programme. The Right to Information Act will also facilitate the process of empowering the rural poor (often illiterate) in understanding their entitlements under various pro-poor schemes of Central and State Governments.

- Training and capacity building of all concerned with the implementation of the programme is extremely important. Suitable institutions will have to be identified for imparting training to administrators, Panchayat leaders, SHGs and others who will be involved in implementing the Food Guarantee Act.

- The Act should provide scope for including feasible land reform measures like providing dalits and the poor with space for a homestead garden where the needed vegetables and fruits can be grown. SHGs can also be given space on lease in common property land for raising nutrition gardens and fodder for farm animals.

- Integration with primary health care is exceedingly important. For example, de-worming should be made compulsory at least once in two months. Multiple fortified salts could be used in noon meal programmes in order to attack the problem of hidden hunger caused by micro nutrient malnutrition.

- The Act could stimulate a movement for storing grain and water everywhere through community food and water banks. A national network of community food banks could be established.
Nutrition and education are fundamental to enabling every individual to experience a productive and healthy life. Therefore the enactment of a Food Guarantee Act will be the best method of ensuring that we are able to accomplish the UN Millennium Development Goals.

Thanks to the extensive work done both within the country and outside on issues relating to “Right to Food”, there is considerable legal and technical expertise available for preparing a framework for Food Guarantee. We should therefore proceed with this initiative.

It will be appropriate to operationalise the Food Guarantee Act on August 15, 2007, which marks the 60th anniversary of India’s independence.

2.4.6.5 The twin advantages of this approach will be higher food production induced by enhanced consumption and the achievement of the UN MDG relating to hunger and poverty.

2.5 Road Map for Eliminating Hunger

2.5.1 In a country with a high prevalence of poverty and malnutrition, the Government of India should always retain a commanding position in the management of the food security system. This will call for a grain purchase policy, which takes into account the changes in the cost of production, (such as a rise in diesel price), subsequent to the announcement of a Minimum Support Price (MSP). Traders will give a price above MSP when they expect that prices will shoot up within a few months. As Prof Amartya Sen has often stressed, we should not forget the lessons of the Bengal Famine of 1942-43, where millions died of starvation not because there was no food in the market, but because the surplus food stocks were in the hands of private merchants. Building a sustainable food security system will require attention to both the availability of sufficient stocks and who controls them. The global wheat stocks are down this year and the political leadership of the country should decide how to ensure the food security of 1.1 billion children, women and men in an era where much of the foodgrain stocks will be controlled by national and international grain traders and cartels. National Food Sovereignty should not be lost.
2.5.2 While import of wheat, pulses, sugar and oilseeds may be necessary during 2006 in order to prevent an undue rise in prices, we should avoid the danger of making this a habit. Our food budget should be managed with home grown food since agriculture is the backbone of our rural livelihood security system. **What is important is to recognize that imports of pulses and oilseeds serve as indicators of our failure to launch a green revolution in dry farming areas, in spite of having the technologies and resources to do so.** Imports of crops of importance to the income security of farm families in rainfed areas imply generating more unemployment and misery in such areas. Import/ export of pulses, oilseeds and wheat should be resorted to only when absolutely necessary.

2.5.3 Water is a critically important resource for agriculture. Increasing privatization of our food and water security systems has important implications for the food, income and work security of small and marginal farmers and agricultural labor. The WTO agreement entered into at Marrakesh in 1994 resulted in an unequal trade bargain. **The growing privatization of food and water security systems is already leading to an unequal social bargain.** We will never be able to achieve the UN Millennium Development Goal in the area of hunger and poverty elimination, if we do not insulate the farmer-consumers from unfair trade and social bargains.

2.5.4 If we are to achieve a second green revolution covering rain fed areas, the first important requisite is opportunity for assured and remunerative marketing for dry land farm products like pulses, oilseeds, millets, vegetables, fruits, milk and meat. The decision to purchase and include ragi, bajra, jowar and other millets in PDS should be a permanent one. This will help to enhance nutrition security on the one hand, and the productivity and economic sustainability of improved dry land agriculture, on the other. There is a large untapped reservoir of dry land farming technologies and we can see a drastic rise in the productivity and production of crops in these areas if farm families are supported by credit, insurance, a fair price and assured market for their produce.
2.5.5 The six-point action plan outlined in this chapter is based on the considerations set out above. The plan recognizes that the problem of food security is both multidimensional and cuts across the rural-urban divide. Since urban food insecurity and deprivation are closely related to rural deprivation, a comprehensive rather than a sectoral approach is required. The six points in brief are:

- Reorganise the delivery of nutrition support programmes on a life-cycle basis with the participation of Panchayats and local bodies.
- Eliminate micronutrient deficiency induced hidden hunger through an integrated food cum fortification approach.
- Promote the establishment of Community Food and Water Banks operated by Women Self-help Groups, based on the principle ‘Store Grain and Water everywhere’.
- Help small and marginal farmers to improve the productivity, quality and profitability of farm enterprises and organize a Rural Non-Farm Livelihood Initiative.
- Introduce support systems to SHGs to make them economically and organizationally sustainable. Establish for this purpose SHG Capacity Building and Mentoring Centres and focus on developing Micro-Credit Banks into Sustainable Livelihood Banks.
- Formulate a National Food Guarantee Act continuing the useful features of the Food for Work and Employment Guarantee programmes and introduce it on 15 August, 2007, which marks the 60th anniversary of our independence. The Food Guarantee Act will be a powerful tool in achieving the goal of a hunger-free India. By increasing demand for foodgrains as a result of increased consumption by the poor, the economic conditions essential for further agricultural progress can be created.

2.5.6 Organisation is the greatest human invention of all time. Organization is the social technology through which human beings accomplish together far more than can be accomplished individually. This is why we have placed great emphasis both on PRIs and SHGs for overcoming the chronic problems of hunger and low productivity.
2.6 Assuring Income Security to Farmers through Minimum Support Price, and Food Security for the Nation through a Universal PDS

2.6.1 We have proposed a comprehensive and integrated Food and Nutrition Security System, which if accepted and implemented, will help to make hunger history. An important requisite for achieving these goals is the development of an income and work security system for small and marginal farmers and landless rural manual labour.

2.6.2 There is ample evidence in the country to show that our farm families will produce not only more foodgrains, but also horticultural and animal husbandry products provided they have opportunities for assured and remunerative marketing. Progress in the production of milk and poultry products was triggered by access to remunerative prices and markets. We therefore suggest the following operational procedure:

- Announce the MSP for a wide range of crops of importance to PDS before sowing, taking into account the recommendations of CACP.

- Fix the procurement price at the time of harvest, taking into account the prevailing market price. The procurement price will take into account the cost escalation in inputs like diesel, since the announcement of MSP.

- Since Government purchases are for ensuring a hunger-free India, issue a Smart Card or coupon which will entitle those farmers who sell their produce to PDS, purchase inputs like seeds, fertilizers, veterinary pharmaceuticals etc., at concessional prices (such as ten percent less than the market price). This will be an appropriate recognition of the contributions of farm families who have decided to participate in the National Movement for Making Hunger History

2.6.3 Through the above 3-pronged strategy, both, national food security and sovereignty, as well as freedom to farmers to get the best possible price, can be achieved. Large companies which wish to purchase essential commodities at a little
higher price than that offered by Government, in the expectation of making large projects later, can also be kept under check. We request that the above 3 principles may be considered and adopted in an appropriate manner as soon as possible.

2.6.4 For ensuring food security, we should move immediately to a Universal PDS as elaborated in section 2.4.1

2.7 National Food Security and Sovereignty Board

2.7.1 Keeping inflation under check by making essential commodities available in adequate quantities and at affordable prices must be a national resolve rather than just the commitment of a few political parties. Food is the first among the hierarchical needs of a human being. Therefore, eradicating hunger arising from deprivation must be a national commitment and an All Party endeavor. Given the necessary fusion of political will and action, professional skill and peoples’ participation, we can make speedy progress in achieving Gandhiji’s goal of ensuring that the God of Bread resides in every home and hut in our country. We suggest that for providing political commitment and oversight to the “Make Hunger History Movement”, a National Food Security and Sovereignty Board may be set up with the following composition:

- Prime Minister – Chairperson
- Union Minister for Food and Agriculture
- Union Ministers of Finance, Rural Development, Water Resources, Panchayati Raj, Commerce and Environment (other Ministers could be invited in accordance with the agenda)
- Leaders of all national political parties
- Chief Ministries of a few States representing both food deficit and food surplus States
- An eminent professional in the area of Food Security – Member Secretary

2.7.2 With the approval of the Chairperson, other Ministers from Central and State Governments and appropriate Secretaries to Government could be invited to participate in the meetings of the Board, based on agenda items.
2.7.3 Such a National Food Security Board can help to keep sustainable food security and sovereignty as a **National Common Minimum Programme** (in the same manner that UN MDGs represent a global common minimum programme for Human Security).

2.7.4 While the principal terms of reference to the National Food Security and Sovereignty Board should relate to the operation of MSP and PDS and the maintenance of a food security reserve, it should also review from time to time the progress being made in achieving a 4% growth rate in foodgrain production and 8% growth rate in horticulture, animal husbandry and inland and marine fisheries. Emphasis should be on food security with home-grown food, for the reasons explained earlier. Also, the Board should provide oversight to issues such as the diversion of prime farmland for non-farm purposes, and supply augmentation and demand management with reference to irrigation water.

2.7.5 The Board may also review periodically the progress being made in ensuring adequate availability of cereals and other components for a balanced diet through the following action points suggested by NCF in its Third Report (December, 2005):

- Soil Health Enhancement
- Water harvesting, aquifer recharge, conservation and efficient use of irrigation water for achieving more income per drop of water
- Credit and insurance
- Technology (production and post-harvest), and inputs for Mixed Farming Systems (i.e., crop – livestock integrated fish production systems).
- Assured and remunerative marketing

2.7.6 India is likely to have the world’s largest population by 2040 or even earlier. We also have the world’s largest farm animal population, which need feed, fodder and water. The human and animal population supporting capacity has already been exceeded in many fragile ecosystems. **It will therefore be appropriate for the National Food Security cum Sovereignty Board to foster the concept that children should be born**
for happiness and not just for existence, a concept propounded by the French Mathematician Marquis de Condorcet in 1895.

2.7.7 Also, as suggested in the earlier reports of NCF, there is need for nutritional support to families affected by HIV/AIDS, Tuberculosis, Malaria and Leprosy. Mere drug-based approaches are not adequate for the poor. Therefore a food cum drug based approach should be the approach of the National Rural Health Mission

2.8 Hunger Elimination: Achieving the UN Millennium Development Goals

2.8.1 An analysis by the Union Planning Commission has indicated that we are falling behind in achieving the proportionate targets set for 2015 under the UN MDGs. In particular, we should redouble our efforts to achieve Goal No.1 relating to hunger and poverty. Many of the goals will need integrated attention. For example, MDG 3 deals with gender equity and women’s empowerment. This is vital for achieving the goal of MDG 1. Hence, a Gender Audit Procedure should be incorporated in all programmes and policies

2.8.2 The following are some of the steps needed:

i) Agriculture plays multiple roles and is the guardian and backbone of the food, livelihood and ecological security systems. There is need for greater emphasis on integrated on-farm and non-farm livelihood opportunities, so that work and income security gets enhanced. Market driven Non-farm livelihood opportunities in rural areas are essential for achieving MDG I. A Livelihood Impact Analysis Methodology should be developed for adoption in our development and trade policies and programmes. Importing cheap and subsidized food from industrialized nations, rather than concentrating on helping small farm families to increase productivity and profitability may lead to greater unemployment and rural distress. The option of food imports has to be weighed against the collapse of livelihoods of millions of small cultivators and peasants. We should take the leadership in developing a Livelihood Security Box in the World Trade Agreement in relation to agriculture.
ii) Enhancement of small farm productivity holds the key to the elimination of hunger and poverty in rural areas. **Sustainable enhancement in small farm productivity and profitability should be on the top of the agenda for the 11th Plan. If agriculture goes wrong, nothing else will have a chance to go right.** Protecting and improving the production systems of farmers with small holdings should hence be accorded high priority.

iii) **There has to be a shift in emphasis from food security at an aggregate national level to nutritional security at the level of every individual. Hidden hunger** caused by the deficiency of iron, iodine, zinc and vitamin A in the diet, is widespread. As discussed earlier, a **Food cum fortification approach** will be necessary to eradicate hidden hunger related to micronutrient deficiencies. This will call for reviving dying crops and dying wisdom. The food security basket should be enlarged by including a wide range of millets, grain legumes, tubers and leafy vegetables like *Amaranthus* in the diet. Public distribution and school feeding programmes should include nutritious millets.

iv) An unacceptably high proportion of new born children are characterized by low birth weight (LBW) due to maternal and foetal under nutrition and malnutrition. Such children are handicapped even at birth in their ability to realize their innate genetic potential for mental and physical development. A **Lifecycle approach** should be adopted in nutrition support programmes, with priority going to pregnant women and infants. It is also necessary to emphasise the importance of providing support services to farm women, like crèches and daycare centres.

v) There is rightly much emphasis on mapping the ‘Hunger Hot Spots’ of India. Equal importance should be given to mapping the ‘Agricultural Bright Spots’, which show how to replace poverty with prosperity through agricultural progress. The factors which resulted in agricultural bright spots should be highlighted, so that the message **“we can make hunger history”** can be spread. The need for a **symphony approach** resulting in symbiotic partnerships among farm families, policy makers,
academia, agricultural experts, business and industry, and mass media, cannot be over-emphasised. Assistance should be provided for the growth and spread of Rural Prosperity Symphonies.

2.8.3 The economic, social and political aspects of hunger and poverty are not being recognized adequately; as a result social unrest, ethnic conflicts and resentment leading to violence are increasing. Keeping agriculture at the top of the global and national developmental agenda should be a priority item in our action plans relating to MDG 1. The global trade agenda should also be pro-small farmer. Adjustment of a mix of farm enterprises to maximize economic/market opportunity, as well as the promotion of integrated crop-livestock farming systems are important for the economic sustainability of farming. Agricultural and Rural Universities should undertake Rural Systems Research (RSR), designed to generate concurrent attention to on-farm and non-farm livelihoods in a holistic manner. An effective production system requires substantial knowledge of factors both within and external to the farm. This is where the mobilization of modern communication and information technologies assumes significance.

2.8.4 A self-propelling and self-replicating model of food security is the need of the hour. Through Community Food Banks, we can launch a “Farmers’ Movement for Sustainable Food Security”. This will help to promote a farmer participatory approach to building a sustainable national food security system, based on community level Gene, Seed, Water and Grain Banks. This will help to link conservation, cultivation, consumption and commerce in a mutually reinforcing manner.

2.8.5 Our response to emergencies should be designed in a manner that every calamity becomes an opportunity to strengthen the coping capacity of local communities to meet such calamities better in the future. Life saving crops like tubers should be promoted and crop live saving techniques introduced. In Tsunami affected areas, Coastal Bioshields consisting of mangroves, casuarinas, salicornia and other halophytic plants, should be encouraged. Emergencies are likely to increase in the future, as a result of climate change, and there has to be concerted efforts in avoidance, adaptation and mitigation strategies.
2.8.6 Biosecurity and food safety are gaining in importance. Government of India should help State Governments to increase their competence and capability in these areas. Capacity building is also important in the safe and responsible use of biotechnology as well as in the areas of organic farming, conservation agriculture and precision farming. Support to Conservation farming is needed, on the lines of the support being extended to their farmers by industrialized countries under the Green Box provisions of WTO.

2.8.7 The social engineering aspects of integrated natural resources management, integrated pest management (IPM), integrated nutrient management, etc, need to be emphasized. A purely technocratic approach will not help. Education and social mobilization are equally important. Water harvesting, aquifer recharge, and economic and efficient use of water should become everybody’s business. Scaling up is needed in the case of successful projects. This is where the active involvement of PRIs will be of great help.

2.8.8 Seemingly impossible tasks can be achieved by mobilizing the power of partnerships. South-South collaboration is extremely important in this respect. India should become the hub of a Knowledge Coalition for Sustainable Agriculture and Food Security bringing together CGIAR, FAO, IBRD, IMF, UNDP, WHO, WTO, UNICEF, UNESCO, UPOV, WIPO and all other relevant organizations.

2.8.9 There is no time to relax and Government of India should become the main actor in bringing about convergence and synergy in the area of elimination of chronic and hidden hunger. There should also be a distinction between projects and policy, since bad policy will make even good projects fail. A critical review of earlier programmes will show what is working and what is not working and why. We should also help to resolve conflicts and contradictions among international organisations, as in the areas of Farmers’ Rights and UPOV, and GMOs and WTO.

2.8.10 The UN MDGs represent a global Common Minimum Programme in the area of sustainable human well-being and security. We should therefore not fall behind in achieving these very modest but important goals.

MSP and the Cost of Production

An examination of the projections of cost of cultivation for 12 foodgrain crops given by the Commission for Agricultural Costs and Prices (CACP) for the crop season 2005-06 with the MSP prevailing in 2004-05 clearly shows that C2 cost (cost of production per quintal) is not covered by the MSP in most States for the 12 crops. The data for paddy and wheat is given in Tables below. The data shows that only in four of the 12 major States producing paddy in the country, C2 is lower than the MSP and in the case of wheat it is lower than MSP in all the seven producing States except Madhya Pradesh.

CHAPTER 3
ECONOMIC ACCESS TO FOOD – IMPROVING LIVELIHOOD OPPORTUNITIES AND INCOMES

3.1 Introduction

3.1.1 The rapid growth of population in India, particularly in the second half of the twentieth century posed threat to national food security. The threat reached dangerous proportion in the mid sixties when grain shipments from abroad were eagerly awaited for feeding the population. The situation was untenable and eventually led to launching of the Green Revolution, achievement of self sufficiency in food grains and a growing stock of surplus food grains by the mid seventies. Happily such a threat does not exist any more. Food security has been attained at macro level in the country. However, there was another problem; while large quantities of food grains had accumulated in public stocks, nearly one fifth of our population was underfed according to minimum calorific requirement for a healthy and active life. Nearly 46% of all Indian children under five years age were malnourished\(^1\). This was in stark contrast to the fact that the country had exported food grain with large subsidies. While national level food security [availability of food at macro level] is achieved, at the household level there are serious problems and the situation is quite alarming. It would be recalled that a contrasting problem for a long time was the rising financial and other costs to the State in terms of storage, interest charges, maintenance, quality and value deterioration etc. of the rising food grain stocks and the existence of hunger and malnourishment of the people at the same time.

3.1.2 Food security at the household level is primarily determined by availability of food and the ability of the household to access food. It is intrinsically linked with the source of livelihood and the nature of the public distribution system that is prevalent. The poor have to either be able to grow enough food or must have enough money to be able to buy food. The former would depend on the quality and quantum of land available to the poor and the infrastructure, credit, market intelligence and linkages etc., while the later, in a

\(^1\) United Nation’s Human Development Report [2003]
situation where the poor have little or no land, is linked with the availability of livelihood opportunities and the public distribution system.

3.1.3 Historically, poor households in India relied on traditional, family and community-based mechanisms of social protection to cope with deprivation. The traditional social security system in India was built into family, caste and socio-religious traditions under which food security to a certain extent was provided to the very poor, the service providers etc by the landlords and richer people and also the institutional feeding in Temples/Gurudwaras from the incomes including offerings etc. The kin networking was strong and the disadvantaged members of the community, the physically/mentally handicapped, widows etc were generally seen as the concern of the entire community. The process of change has eroded many of these features of our traditional social practices. Rising population, the emergence of a labour surplus economy and commercialization of agriculture have all contributed towards weakening of the social support systems. At the same time, the modern mechanism of social protection has left many gaps. The social oriented policies of the State are not adequate. Further, the risks/vulnerabilities and aspirations have increased many folds adding to the distress in rural areas. A very fundamental cause of India’s poverty particularly in the rural areas is the less than satisfactory performance of the agriculture sector.

3.1.4 The National Sample Survey data on income generated by farmer households during 2002-2003\(^2\) shows that on average a farmer household on all India basis, earns Rs. 2115 per month of which [Rs. 969 per month i.e. 46% of total income] from cultivation, followed by wages [Rs. 819 per month i.e. 39%] non farm business [236 per month i.e. 11%] and animals [Rs. 91 per month i.e. 4%]. The above monthly income estimates exclude income from rent, interest, dividend etc. The State wise disaggregated data shows considerable variations in per family income as well as the components of the income. The highest per month farmer household income was in Jammu & Kashmir [Rs.5488] followed by Punjab [Rs. 4960], Kerala [Rs. 4004], Assam [Rs. 3161] and Haryana [Rs. 2882]. The lowest income was in Orissa [Rs. 1062] followed by Madhya Pradesh [Rs. 1430], Rajasthan [Rs. 1498], Chhattisgarh [Rs. 1618], Uttar Pradesh [Rs. 1633] and Bihar [Rs. 1634]. In five States the income

from wages exceeded income from cultivation. These states were Rajasthan [62%], Orissa and Tamil Nadu [53-54%], Kerala [50%] and West Bengal [43%]. The proportionate income from animals was highest in Gujarat [[17%], Bihar [15%] and Maharashtra [6%]. The proportionate income from non farm was highest in Kerala and West Bengal [18%], Rajasthan [14%] and U.P and Bihar [11%]. The State wise break up of monthly incomes in given as Appendix- I

3.2 Income from Farming

3.2.1 The major source of income in farmer’s households is income from farming which to a large extent depends on the size of land holding, productivity level and surplus between the cost of cultivation and price of the output. These are discussed in the following paragraphs.

Distributions of Land

3.2.2 Land holdings inequality reflected in land ownership and the technical progress biased against labour had compounded the problem. In 1991-92, the share of the bottom half of the rural households in the total land ownership was only 3.33% and the top 10% was as high as 54.08%. The extremely skewed distribution of land owned by rural household under various classes of farmers [according to land holding criteria] is shown at Table 1.

Table 1: Distribution of Land

<table>

3.2.3 It is doubtful that the major part of the 85.29% of the rural households who are either landless [11.24%] or are sub-marginal, marginal and small farmers
[74.05%] could grow enough food to provide nutritional security to themselves and their families keeping in view the productivity standards and the fact that nearly 60% of the land is unirrigated. The NSS Report referred to at paragraph 3.1.4 shows that on average the total monthly income of farmers households for land holding upto 2 hectare was lower than the total consumption expenditure indicating the non viable status of these farmer households. The details are as under [Table 2]:

Table 2: Average Monthly Income from Different Sources, Consumption Expenditure and Net Investment in Productive Assets Per Farmer Household [2002-03]

</tbody>
</table>

Though the above are all India averages, it would appear that most of the farmer households with land upto 1 hectare and many farmers households with land between 1 hectare and 2 hectare may not be earning enough to meet the family consumption expenses.

3.2.4 **Since nearly 75% of the rural households are sub-marginal, marginal or small farmers improving the small farm productivity and profitability as a single development strategy could make the greatest contribution to improve the nutritional security at the household level.** Besides the general steps for raising the productivity and incomes of the farmers [discussed later in the chapter] the specific steps which focus on benefitting small and marginal farmers could be, increased investment in human resources, adequate and timely availability of quality inputs including credit, a fine tuned insurance system to cover production risks, an effective and efficient extension system, arrangements for custom hiring of agricultural machinery and development of low cost machinery for use by these farmers. There is also urgency in completing the unfinished agenda of land reforms; distribution of
ceiling surplus land, attention to common property and wasteland resources and consolidation of holdings etc. However, these would require a strong political will and determination.

3.2.5 The sub marginal/marginal/small farmers face problems in accessing inputs, use of machinery and also lack the power of scale in marketing their produce. The need is to develop and popularize various organisational structures, formal and informal on a win-win basis for all concerned. In the Fourth Report of the National Commission on Farmers, ‘Serving Farmers and Saving Farming-Jai Kisan: A Draft National Policy for Farmers’ some of the methods for providing power of scale to farmers have been discussed. Such methods could include elements of Cooperative Farming, Group Farming by Self Help Groups [informal structure], Small Holder’s Estates and Contract Farming etc. taking care that the models so developed are farmer centric and sustainable.

3.2.6 The tenancy laws could also have important bearing on the total income of the landless marginal/small farmers who have a high stake in the operations of the land lease market in their area. However, the laws relating to tenancy differ in the States. Kerala and Jammu & Kashmir have completely banned leasing out the agricultural land, while in Telangana in A.P, Karnataka, H.P, M.P, and U.P leading out of agricultural land is allowed only in case of certain disabled persons like the widows, minors, personnel of the armed forces etc. Punjab, Gujarat, Maharashtra, Assam and Haryana have not banned leasing of agricultural land but the tenant acquires a right to purchase the leased in land within a specified period of tenancy. In A.P [other than Telangana], Orissa, Rajasthan, West Bengal and Tamil Nadu there are no restrictions on leasing of agricultural land excepting that in West Bengal only the share croppers lease are allowed. In the tribal areas of A.P, Orissa, M.P and Maharashtra only competent authority could permit transfer of land. However, the various loopholes and difficulties in actual implementation of these provisions has meant that leasing of agricultural land continues to be done [around 10.36 million hectare was covered by lease arrangements in 1991-92 which formed nearly 8.2% of the total cultivated area] but in most places in a concealed manner and generally on a year to year oral lease basis with all its attendant evils, which could be more exploitative to the landless, marginal and small
farmers. The increasing cost of cultivation, falling returns, low overall surplus, non availability of irrigation and problems in accessing institutional credit are some of the factors leading to leasing out land by small/marginal farmers.

3.2.7 The tenancy laws have to be such as to encourage all sections of rural population to participate in the land lease market depending upon their resources, availability of off farm/non farm employment opportunities, the wages rate, cropping pattern and income possibilities from use of land in agricultural and activities allied to agriculture. **However, there should be no fear of loss of leased out land to others.** In areas where agriculture is well developed, wages are high and non-farm employment opportunities broad based, it may be an attractive alternative for small/marginal farmers to lease out their land and take up wage employment/start an independent tiny/micro enterprise if the law assures them that they would not be deprived of their land. On the other hand, in States where agriculture is relatively backward, wages low and alternative employment opportunities limited, the small/marginal farmers could lease in land from medium and big farmers who may like to migrate to urban areas for non-land based employment/business opportunities. Thus, a well thought out land lease policy which could protect the rights of farmers leasing out land, could benefit the farmers in increasing the size of their operational holdings for securing scale economies or alternatively encourage marginal/ sub marginal farmers to exit farming and try to earn their income from wages/business etc. while at the same time getting rent for their leased out land. In certain States, the fall out of the existing restrictive tenancy laws is that many of the farmers opt to keep land follow in the event of their moving to the towns/cities for employment/business. This not only adversely affects production but also leads to deterioration of the quality of land. This phenomena is more widespread in UP, Karnataka, Kerala, HP, Jammu & Kashmir, AP where leasing of land is either completely banned or is allowed only in the case of certain disabled categories like widows, minor, armed forces personnel etc. **A more rational and liberal tenancy system could make a substantial favourable impact on the livelihood pattern of the rural households.**

3.2.8 The landless households in rural areas may be provided with some land which would give them space for at least kitchen gardening and animal rearing to
enable them to enhance their household income and improve nutrition security to some extent.

Productivity of Agriculture

3.2.9 Apart from the size of holding, the productivity levels primarily determine the income of the farmers. Unfortunately, the per unit area productivity of Indian agriculture is much lower as compared to other major crop producing countries [Table 3]. There are also wide gaps in the yield among and within States.

Source: Agriculture At a Glance [2002] Ministry of Agriculture

3.2.10 Higher growth in productivity in agriculture would require substantial increase in public investment in agriculture related infrastructure particularly in irrigation and also in drainage, land development, water conservation, research development and road connectivity etc. The most disquieting feature of Indian agriculture is the decline in real investment in irrigation in recent years. Management of public sector investment in irrigation, power, roads etc needs improvement. The capital formation in agriculture which was 1.6% of the GDP in 1993-94 had declined to 1.3% of the GDP by 2000-01. Similarly the share of agriculture and allied sector in the total gross capital formation declined from 14.3% in 1970-71 to 7.1% in 2000-01. This trend needs to be reserved. Public sector investments are specially needed in the poorer, low rainfall areas of the country, which must now play a larger role in achieving rapid agriculture growth. These areas do not attract much private investment, which generally prefer irrigated and developed areas. It is expected that the increased public sector investment in such areas would also attract private on farm investments and also in due course increased investments in agro-based industries. The Bharat Nirman Programme and its implementation is expected to improve the
rural infrastructure including creation of additional irrigation, rural roads, improved telephone connectivity and power.

3.2.11 Soil health and seeds need urgent attention. A national network of advanced soil testing laboratories with facilities for detection of micronutrient deficiencies could be extremely important. “As a single agronomic intervention application of needed nutrients to the soil could have the greatest impact on increasing yields with a very favourable cost benefit ratio”. The KVKs could have a key role in the above development, information dissemination to farmers and in creating a low cost trained manpower in agriculture in rural areas. However, for the above purposes, the KVKs will have to strengthened, restructured [where necessary] and the staff trained adequately. Effective linkages between the KVKs and the local department of agriculture also need to be established and strengthened. Seed availability and seed replacement rates need attention. There is not only mismatch between seed availability and demand of seeds of different varieties, there is also a serious problem about the assurance of quality and prices of particularly the genetically modified seeds.

3.2.12 Investment in watershed development and the water saving technologies in the rainfed areas could help in improving the incomes of the rural households considerably. Access to even limited irrigation [small water ponds filled up by rain water] could overcome drought conditions during critical growth periods, which could substantially increase production and incomes.

3.2.13 Agricultural research which could help the farmers to diversify into higher value products and developing technologies which could reduce the impact of long dry period on crops and enable them to have a diversified income flow by mix of crops, horticulture, tree crops and animal husbandry could help in stabilising their incomes. The research which focuses on crops that are high in nutrients and crucial to the well being of the poor could be of particular benefit to them. The agriculture research has to become both farmer and market oriented. With privatization of research in other countries the farmers have to pay a high price for its usage. The need is to increase investment in local research and make the research institutions accountable.
3.2.14 The increasing complexities of production and marketing requires information dissemination and training in use of modern technologies. The weakening of the extension services in the public sector and negligible progress of private extension support, inspite of Government efforts in this direction has created a vaccume. The farmers often rely on input dealers for advice which is based more often than not on ‘business considerations’ and rarely on knowledge. Extension system needs a relook with the objective of developing both top down and bottom up flow of information between farmers, extension workers and researchers and development/dissemination of locations specific farm technologies.

Profitability in Agriculture – Income of the Farmer

3.2.15 The economic access to food for the farm households ultimately to a large extent depends on the Farm Business Income [FBI], i.e., the difference between the value of output produced and costs actually paid out. In the State of the Indian Farmer: A Millennium Study-Cost of Cultivation and Farm Income-Dr. Abhijit Sen, it was observed that per hectare real FBI had increased in every State during the 1980s, but in most States peaked in mid 1990s. In Karnataka, Maharashtra, Orissa, Bihar and Gujarat, real FBI per hectare was lower at the end of the 1990s decade than at the beginning. The all India rate of growth of real FBI per hectare decelerated sharply from 3.21 per year during the 1980s to 1.02 p.c. per year during the 1990s. Keeping in view that the number of cultivators during 1990s grew at 1.44% p.a. and the cropped area by only 0.45% p.a. in the same period, means that the real FBI on All India basis during the 1990s remained almost static [growth rate of about 0.03 p.c. per annum]. The study further reveals that only in Andhra Pradesh, Gujarat, Haryana, Madhya Pradesh, Rajasthan, Punjab and West Bengal the actual average land holding was bigger than the minimum required to keep the farm family above the official poverty line; it would appear that a very large number of farmers households are unable to generate adequate income from their farms.

3.2.16 During the nineties the profitability in agriculture declined by 14.2% mainly due to stagnancy in yield growth and increase in prices of inputs outpacing the
increase in prices of output\(^3\). The margin deteriorated particularly for cotton, almost all coarse cereals and oilseeds. Even if we look at the latest cost of cultivation for major food grain crops for 2005-06 [CACP data] and compare it with MSP prevailing in 2004-05, it would appear that the C2\(^4\) costs were not covered even by MSP in many States. It would be extremely unlikely that in long run farmers would continue to cultivate those crops where the C2 costs are not recovered. Some details are given below:

<table>
<thead>
<tr>
<th>Name of the Crop</th>
<th>States where the C2 cost projection by CACP for 2005-06 were not covered by MSP of 2004-05</th>
</tr>
</thead>
<tbody>
<tr>
<td>Paddy</td>
<td>A.P, Assam, Haryana, Karnataka, Kerala, M.P, Tamil Nadu &amp; West Bengal</td>
</tr>
<tr>

<td>M.P, Maharashtra, Orissa, Rajasthan &amp; Tamil Nadu</td>
</tr>
<tr>
<td>Gram</td>
<td>Haryana, Rajasthan</td>
</tr>
<tr>
<td>Barley</td>
<td>Rajasthan</td>
</tr>
</tbody>
</table>

The above data is quite indicative of deterioration in farm incomes mainly due to increasing costs and near stagnation of yields, poor output prices and lack of support in marketing.

3.2.17 Besides other factors, the deceleration in rates of input use growth has also contributed towards deceleration in yield growth though the potential for yield growth

Source: State of Indian Farmer: A Millennium Study- An Overview- Dr. Y.K. Alagh

\(^4\) C2 includes all expenses in cash and kind incurred by the farmer, interest on the value of owned capital assets excluding land, rental value of owned land [net of land revenue], rent paid for leased in land and imputed value of family labour.
with dissemination and application of known technologies is not yet exhausted. With limitations in increase in prices of output and overcrowding of subsidies, the farm incomes could be enhanced by improving productivity, more efficient use of nutrients, timeliness and qualitative improvement in availability of inputs, better extension, advice and research support, availability of information/knowledge, training, market reforms, improvement in post harvest operations, value addition and providing power of scale to the small/marginal farmers in accessing inputs and marketing of their produce etc. Improvement in risk mitigation systems and support in time of natural disasters are needed. An efficient marketing system with farmer’s organisations as important players could significantly add to farmer’s income from his produce. As a matter of fact farmer’s organisations are needed at various levels of the value chain. The small and marginal farmers suffer loss of income due to distress sale immediately after harvest and are also on receiving end against the Commission agents/traders etc. The APMCs have not given adequate attention to grading, development of village haats and ensuring an efficient business like operations at the market yards [various aspects relating to Marketing Reforms have been discussed in detail in the Third Report of the National Commission on Farmers]. The Minimum Support Prices [MSP] should be protected across the country and the Market Intervention Scheme [MIS] used effectively in the case of commodities which are sensitive in different regions/areas. The banks need to liberally provide pledge loans. However, as there are not many accredited godowns, the bankers may have to rely on storage of produce with the farmers. A system where two separate limits are fixed for Kisan Credit Card holders i.e., one for inputs and a higher limit against produce when the production risks are over would enable the farmers to avoid selling immediately after harvest and thereby get a better price for his produce. **Further, it is very important to provide safety nets to protect the interests of the crops, people and regions which are likely to be affected in the process of globalization.** Bridging the yield gaps between different regions and between the demonstration farms and farmer’s fields require no technology revolution but wide spread adoption of improved practices and timely availability of quality inputs. The WTO provisions need not be cited as a reason for not doing the above. These measures could be introduced in a WTO compatible manner.
3.2.18 The strategies for increasing the productivity and incomes of the farmers discussed in the earlier paragraphs would also improve the ability of the small and marginal farmers to produce larger crops, earn more and improve their access to food to a certain extent. In addition, they will require to augment their incomes from animal husbandry and wages both in farm and non-farm sector etc. Multi stream of incomes is essential for them for spreading the risks, having a more regular and continuous income flow and increasing the total incomes. **However, in the case of landless and sub marginal farmers, reliance may have to be mainly on activities allied to agriculture and non farm and farm employment which would be discussed in the following paragraphs.** The landless require either asset or skill and the social security support for their nutritional security.

### 3.3 Income from Animal Husbandry

3.3.1 Nearly 4% of the farmer household income on All India basis is from livestock. However, in some of the States like Gujarat, Bihar, Maharashtra, Punjab etc. the share of income from animals is higher. The important fact is that the livestock sector is of special importance to small/marginal farmers as it helps to spread the risks and provide a more even stream of income to eliminate seasonable hunger. These activities typically give higher returns per unit of land and are also labour intensive and hence more suited for these farmers. Incidentally, the ownership of livestock is much more egalitarian than the ownership of land in India. The resource poor families own a majority of cattle, buffalo, sheep and goats. Development of animal husbandry could play an important role in augmenting the incomes of small/ marginal /sub marginal farmers. They form the core of the milk production sector. Taken together the small and marginal farmers accounted for 71% of the in-milk bovine stock in 2002-03. The marginal farmers who had only 20% of the in-milk bovine stock in 1970-71 increased it to 31% in 1981-82, to 44% in 1990-91 and to 52% in 2002-03. The major constraints experienced by these dairy farmers relate to fodder, feed and animal health care facilities. As stated in the Fourth Report of the National Commission on Farmers, there is a need for establishing Livestock Feed and Fodder Corporations to assist Self Help Groups to produce good quality animal feeds. Such corporations could be developed into facilitating bodies for providing seeds and planting material of improved varieties to the Self Helps Groups.
etc for local level production. The productivity of our livestock is low and could be easily improved through better nutrition and animal healthcare. Agri-clinics operated by young veterinary and farm science graduates could be extremely helpful to enhance the incomes of the dairy farmers through higher productivity. However, till the private system establishes itself the need is to tone up the working of the extension services from the Government. There is also a need for conserving indigenous breeds of cattle while promoting appropriate cross breeds in our conditions. The cooperatives could play an important role in the development of the dairy sector as shown by our experience particularly in Gujarat and Maharashtra. The sector needs a focused attention particularly in dry and rainfed regions where there is all the more need to add to the incomes of the farmers. The promotion of the livestock sector would also help in improving the nutritional value of the food basket of our population. The lessons of the poultry sector, where the research, management, extension and marketing capabilities of the private sector has helped the development of the sector need to be studied and replicated in the dairy sector.

3.3.2 Keeping in view the importance of the livestock sector in rural incomes, it needs much more attention. However, while contribution of the sector is around 25% of the agricultural GDP, the allocations of plan funds is less than 16% of the total funds allocated to the agriculture sector. The animal power is used for nearly 60% of the cultivated area, bullock cart continues to be an important means of transportation in rural areas and the total value of meat is over Rs.40,000 crore and it provides employment to a very large population but these aspects are generally neglected. The meat sector, particularly the male buffalo calves, goats and sheep have tremendous potential for increasing rural incomes/employment and even exports provided we take up systematic rearing of these animals and create a large number of village abattoirs which are properly linked to the modern integrated abattoirs. Institutional credit could play a significant role in these developments. At present, bulk of the income in case of meat and particularly buffalo meat is cornered by the contractors/agents/middlemen. Establishment of village abattoirs and orderly development of the meat sector could enhance the incomes of the landless/sub-marginal and other farmers who could rear these animals. Similarly improvement in the quality of bullock carts would not only make these more efficient, add to the incomes of bullock cart owners but also reduce wear and tear of the roads.
3.4 income from wages

3.4.1 As stated earlier [paragraph 4.1.4] according to the NSS estimates [2002-03] on an all India basis, wages formed 39% of the monthly income of the farmer households. Further, in Rajasthan, Tamil Nadu, Orissa and Kerala, the wages formed 50% or more of the monthly income. A major connected issue is the low wage rates in rural India, though rising, these are still far too low especially in the context of irregularity in getting wage employment and also the rising expectations. A very large percentage of our population has no marketable skills and either no or little formal education. Currently only 5% of the country’s labour force in the age group of 20-24 years category have undergone formal vocational training, compared to 28% in Mexico, 60 to 80% in most industrialized countries and 96% in Korea. A strategy to improve employment prospects in future will have to be to ensure that all the new entrants to the labour market are equipped with knowledge and skill for high productivity and high quality employment. There are nearly 300 million illiterate adults in India. The literacy rate among males is nearly 50% higher than the females and is about 50% higher in urban areas than the rural areas. Out of approximately 200 million children in the age group of 6-14 years, only 120 million were in school. Further, less than 7% of the children ever pass the 10th standard public examination. Another connected issue is school drop-outs. According to India Vision 2020 [Planning Commission document] unless something is done to drastically reduce drop-out rates by the year 2016, there will be approximately 500 million people in the country with less than five years schooling and another 300 million that will not have completed high school. Very low investments in human capital means extremely low quality, unskilled, low wage rate employment prospects. Our educational system particularly for the rural areas and the vocational education system needs change in respect of location [rural rather than urban for more enrollment from rural areas], strengthening the general education component in vocational training and closer involvement of the private sector in curriculum development. The skill development has to be not only in traditional areas but in many new activities and vocations where a large number of skilled persons are needed. The private sectors including trusts/NGOs etc also need to be strongly supported for establishing vocational training centres. The Government could announce a large number of scholarships, say, a
million each year to rural students particularly from BPL and landless families for pursuing market oriented vocational education.

3.4.2 With the existing situation, the National Rural Employment Guarantee Programme [NREGP] is an important and significant step. Such a programme is strongly justified to provide additional employment opportunities to those segments of the population who had not benefited at all or benefited not adequately from the economic opportunities generated by overall growth of the economy. These are mostly people in areas which lay behind in economic growth and people who have little or no productive assets, depend mostly on wage employment for their subsistence and do not get enough of it. It is not intended to discuss the NREGP here but it is hoped that this would be continued for some years and help in building rural assets which would increase sustainable income generating opportunities in the rural areas and the programme would be implemented efficiently duly favouring the rural women, the tribals and the other distressed/handicapped population. The ultimate mission has however to be to train/retrain and improve the human capital from unskilled to skilled population to participate more vigorously in the process of development and growth.

3.4.3 Structural change in work force is taking place in India though slowly. A comparison of 1999-2000 estimates of the National Sample Survey’s [NSS] 55th Round regarding employment with those of 1961 brings out this shift [Table 4].

3.4.4 In rural areas, 7.26 crore people are employed in the non-farm sector as compared to 23.21 crore in agriculture [NSS date 1999-2000] forming about 24% of the total employment. However, the employment growth in the rural areas is continuously decelerating as shown in Table 5.

Source: Draft paper: Generating productive Employment in India’s Rural Non-Farm Sector—A Perspective—Shiela Bhalla

The Table 5 clearly highlights one of the most important issues bothering the country. The rural employment growth rate has come down to 0.68% during 1993-94 to 1999 from 2.12% in 1972-73 to 1983 which is much lower than the growth rate of labour force. [The growth rate of employment between 1993-94 to 1999 was less than one third of the growth rate achieved in 1972-73 to 1983]. Compounding the problem is the fact that in 2002 there were already about 3.5 crore unemployeds in India, approximately three-fourth of these unemployeds were in the rural area. [India Vision 2020-Planning Commission]

Employment in Agriculture Sector

3.4.5 Bulk of the employment in the rural areas is in the agriculture sector and a large part of the rural incomes from wages [39% of the total income of the farmer household referred in para 3.1.4] is also likely to be in respect of agriculture related work. However, the employment growth rate in agriculture has been declining [Table 4]. The estimated labour days per net sown hectare [NSS estimates], increased from 290 days in 1983 to 317 days in 1987-88 to 345 days in 1993-94 to 361 in 1999-00. However, the growth in labour day per gross cultivated area [hectare] increased from 231 in 1983 to 248 in 1987-88 in 264 in 1993-94 and only to 266 in 1999-00.

---

6 The Indian Vision 2020-Planning Commission, states that the growth rate of labour force was expected to be about 2% till 2020. Dr. C. Rangarajan in his V.V. Giri Memorial Lecture [2005] had stated that the rate of growth of labour force during 1993-94 to 1999-2000 had fallen to 1.05% against 2.05% in 1983 to 1993-94.
Thus, while the growth rate [compound] was 1.3% p.a. in during 1983-94 it fell down to mere 0.2% between 1993-94-1999-00. With slowing down in the growth of cultivated area, [the net sown areas had negative growth at 0.2% p.a. during 1993-00], the slow down in labour day per hectare during 1993-94 to 1999-00 meant near stagnation of employment growth in agriculture.

3.4.6 As expected there are very large variations in labour use in agricultural operations in different States. Among States, the highest labour days per hectare [net area sown] in 1999-00 were in Bihar [871] followed by A.P [493], West Bengal [447], U.P [440], Tamil Nadu [419] and Orissa [410]. The lowest labour days per hectare were in Kerala [143] followed by Haryana [175], Punjab [182] and Rajasthan [197]. Looking at crop wise labour used, it appears that in North/Western States, labour use per hectare had declined in the 1990s for almost all crops, and for wheat in almost all States. However, for other States and crops trends are mixed.

3.4.7 In the early stages of ‘green revolution’, land augmenting changes, led by irrigation expansion and use of HYV led to an increase in labour demand. Later, the institutional factors contributed towards the tendency on the part of land owners to adopt labour saving technologies. Rising wages, unwillingness of labour to abide by traditional labour norms, sociological changes [increase in education, unwillingness of different groups to participate in agriculture, withdrawal of women and children from workforce, male workers preferring migrating to towns for work rather than undertake agriculture labour] and availability of institutional credit for tractors/other machinery etc. has led to greater use of labour saving devices. The above developments coupled with slow down in capital formation in agriculture, decline in agricultural growth itself and switch over to crops and practices requiring less labour led to deceleration in growth of labour employment in this sector.

3.4.8 The growth in employment in agriculture is related to growth in intensity of cultivation, growth rate of area under labour intensive crops, level of agricultural wages, institutional and socio-economic factors. The policies which could give the

---

7 Trends in Rural Employment in India with Special Reference to Agriculture Employment – Ravi S. Srivastava.
rural poor greater control over land, augment productivity of small farms, increase area under labour intensive crops [oil seeds, spices, fruits, vegetables etc.] and increase productivity [increased intensity of cropping and yields] would help in increasing the growth of agricultural employment. The need is to follow these policies during the coming years. Further the Special Group of the Planning Commission [2002] had felt that programmes focusing on horticulture, regeneration of degraded forests, waste land development, watershed development, bamboo development and medicinal plants could generate more than 3 million persons days of employment and therefore were important from the view point of employment generation. The potential for growth of employment in crop sector was considered limited; it was estimated that the switch over from cereals to oil seeds/pulses could generate 0.47 million annual man days work.

3.5 Employment in Rural Non-Farm Sector

3.5.1 On All India basis nearly 11% of the income of the farmer households [NSS Report 497 referred at paragraph 4.1.4] came from the non-farm sector. In Kerala and the West Bengal the income from non-farm was highest at 18% followed by Rajasthan at 14%. Households in the regions with low agriculture productivity or unfavorable land man ratio could add to their income by development of rural non-farm sector. A high growth in the farm sector also creates larger demand for non-farm products and services and “pulls” labour into it [per farmer household income from non-farm is highest in Punjab at Rs. 440 per month after Kerala and J & K]. Similarly, limited opportunities for agricultural development and high pressure of population on land [per farmer household monthly income in Kerala with acute pressure on land at Rs.717 from non-farm business was highest in the country] could ‘push’ labour into the rural non-farm sector. As already shown at Table 4, the growth rate of employment in rural non-farm sector has been consistently higher than the entire period of 1972-73 to 1999-2000. During 1993-94, the employment growth rate in rural non-farm sector at 2.34% per annum was nearly 12 times the growth rate in the farm sector at 0.20% per annum. Rural non-farm sector could hold the key to increasing employment opportunities in rural India.
3.5.2 The disaggregated data regarding growth of employment in different sub-sectors in non-agricultural employment in rural areas is shown at [Table 6] for the last about thirty years to assess the trends of growth.

Source: Sheila Bhalla’s Draft Paper: Generating Productive Employment in India’s Rural Non Farm Sector- A Perspective [2005]

Among the sub-sectors, noticeable growth has been primarily in transport, construction, trade and manufacturing while there was negative growth rate during 1993-94 and 1999-00 in mining, electricity and services.

3.5.3 The State-wise data shows that there was overall negative annual growth of rural employment during 1993-94 to 1999-2000 in Goa [-2.90], Himachal Pradesh [-0.13], Tamil Nadu [-1.42], Tripura [-0.67] and Arunachal Pradesh [-2.09]. In following States, the growth rate was positive but below the national level of 0.68%. Andhra Pradesh [0.24], Karnataka [0.17], Maharashtra [0.37], Rajasthan [0.51], West Bengal [0.43] and Meghalaya [0.31]. The negative or extremely low growth rate of employment in some of the larger States like Tamil Nadu, Himachal Pradesh, Andhra Pradesh, Karnataka, Maharashtra, Rajasthan and West Bengal is very disturbing. Incidentally, Maharashtra, Andhra Pradesh and Karnataka which had registered very low rural employment growth during 1993-94 to 1999-2000 had also certain Hot Spots where many farmers have committed suicides during the last five years.

3.5.4 Another important aspect is that almost all the employment growth, in the last few years, took place in the unorganized non-farm sector. Between 1993-94 and 1999-2000 the growth of employment is agriculture was only about 0.2% whereas the
growth in the non-agriculture sector was 0.59% in the organised sector and 3.15% in the unorganized sector.

3.5.5 Dr. Sheila Bhalla in her paper on Generating Employment in India’s Rural Non-Farm Sector- A Perspective has stressed three points for growth of the non-farm sector besides the development of a prosperous agriculture sector. She has observed: “[a] The foundation for accelerated employment and labour productivity growth in the non-farm sector, is infrastructure investment. For the non-farm sector, the key components are a reliable electricity supply, all weather roads and access to a landline telephone facility. A regular bus service is an important additionality [b] For non-farm sector activities, access to affordable credit is crucial. It should be available for medium scale as well as tiny and small scale units and for expansion of existing units as well as for start up of new units. Programmes providing credit needs to pay special attention to productivity raising investments; for example, the motorization of previously manual labour operations in carpenter’s shop, the electrification of small retail shop, investment in pucca structure of repair shops; motorization of human and/or animal powered transport equipment and so on [c] The non-farm development thrust should be directed to particular sector and sub-sectors where demand for the product or services is growing namely: (i) trade, (ii) restaurants and hotels, (iii) transport, (iv) construction, (v) repairs and (vi) certain services. Artisan activities and very small scale manufacturing, in general produce goods which, either because of high costs or poor quality or both cannot compete in the market. There are of course, many exceptions, but they need to be identified and promoted with caution.”

3.5.6 As regards the manufacturing activities the draft paper referred to above suggests the following: (i) Isolated, rural tiny units are a poor bet. For some closely related activities, the development of clusters may be the answer. But these must not be located in the middle of nowhere. Instead locate clusters in or near large market towns, on the peripheries of cities and along major highways or railway lines. There are nearly 6000 block headquarters as also about 7415 APMCs. Many of these centres as well as many existing industrial clusters present favourable location for focused
development and could be the starting point for concentrated action and investments.

(ii) Pessimism about the prospects of locating large scale, organised sector units in rural areas may be misplaced. In recent years roughly one million jobs have been created in the organised manufacturing in rural areas despite the job losses recorded in urban organised sector.

(iii) Proactively encourage development of ancillary units by supporting such ventures and possibly by offering tax breaks to large units which sponsor the development of small units on a contractual basis.

(iv) Promote field-to-market logistical and processing chains for perishable products of agriculture and allied activities. These could be run by cooperatives/producer’s associations or by private enterprises, but the regulation of large private enterprises entering into contractual relationship with small producers is essential. Cold storages and chilling plants may be located in large villages with reliable electricity supplies but most processing, collection or marketing centres need to be in larger market towns and cities.

3.5.7 The generally held belief among the economists is that rapid growth of rural non-farm employment would largely depend on a higher growth rate of agriculture and large public investment in rural infrastructure. A very slow rate of growth of agriculture [2% from, 1996-97 to 2001-02 and only 1.1% for the first three years of the Xth Five Year Plan] and decline in profitability in agriculture noticed during the nineties are likely to limit the purchasing power in the hands of the rural population as also surplus for investments, both of which are not conducive to the growth of the rural non-farm sector.

3.5.8 In the Fourth Report of the National Commission on Farmers a suggestion has been made to integrate all programmes for generating off and non-farm employment into one initiative like China’s Town and Village Enterprise [TVE] Programme and launch a Rural Non-Farm Initiative particularly for families without land or other productive assets. The need is for a counterpart to the National Rural Employment Guarantee Programme [NREGP] in the skilled employment sector. The initiatives like the Small Farmers Agribusiness Consortium [SFAC], Agri-clinics and
Agri-business Centres, Food Parks etc could be strengthened and made more effective. The Rural Non-Farm Livelihood Initiative [RNFLI] could have as its core the KVIC and the restructured and strengthened SFAC and bring all rural non-farm employment programmes together, in order to generate convergence and synergy among them. A Consortium approach may be considered for the purpose involving the Central and the State Governments, Academia, NGOs, public and private sector industry, banks and financial institutions etc. The programme may have to be market driven and at a massive scale to have impact across the country.

3.5.9 Though the rural non-farm sector is providing almost all the new employment opportunities in the rural area, there is no specific ministry/department to focus exclusively on this sector. The Ministry of Rural Development has been running various self employment and wage employment programmes like the Pradhan Mantri Rozgar Yojna, Swarn Jyanti Rozgar Yojana, etc. while the Small Scale Industries and the KVIC etc are looked after by the Ministry of Small Scale Industries and Agro and Rural Industries. In addition there is also the Ministry of Food Processing Industries. Keeping in view the importance of the rural non-farm sector and the need for undivided focus, it may be useful to consider some reorganization and consolidation of all programmes concerning rural industrialisation in one Ministry/Department.

3.6 Agro-Processing

3.6.1 Development of agro-processing is important to increase farmer’s income and also to create employment. It would however, be necessary to introduce reforms in the agriculture sector to facilitate greater private corporate sector investments in agro-processing not only in new units but also in modernizing the established units. The processing industry requires adequate and continuous availability of raw material for processing. Direct purchase from the growers is not possible under the existing APMC Act in many of the States and hence it has to be either routed through the APMC or the concerned State Govt. have to specifically permit the same. Further, there are many other barriers to interstate trade and commerce which come in the way of development of food processing industry. Some of these relate to poor road infrastructure, detention of vehicles, interstate and national permits and other barriers in trucking operations. There are check posts for Regional Transport Offices and Police Check-Posts [for checking documents,
driving and traffic safety etc.], Goods related Check-Posts [for taxes, octroi, sales tax, entry permit, tolls etc.] and others [checking by Flying Squads, Movement of Essential Commodities etc.]. The delays caused by these check-posts are substantial and involve payment of bribes etc. The paper work involved in trucking operations is complex, time consuming and leads to disputes etc. Simplification of the rules/procedures and limiting the check-posts only for matters relating to national security could greatly benefit movement of goods and lead to reduction of transport costs and time.

3.6.2 Further, the traditional varieties may not be suitable for processing because the requirements of food processing are different from food for direct consumption. This necessitates research back up for development of suitable varieties. There could be other cases where suitable varieties are available and the processor may want the farmers to grow the same under supervision and a specific agreement. In the case of perishable commodities, in particular, the processing industry would like contract farming arrangements or some other institutional arrangement so that adequate quantities of appropriate raw material is available in an area preferably at a predetermined prices from where it could be transported to the factory without loss of time and quality. Though various models of ‘contract farming’ have been tried in India, the success has been rather limited. The need is to develop comprehensive, clean, equitable and farmer centric model agreement which could not be abused against the farmers. Special care is required regarding clauses dealing with quality standards, withdrawal conditions, pricing standards, paying arrangements, acts of God clauses and the arbitration mechanism. Till such a code of conduct is introduced and the farmers are empowered by formation of groups/ cooperatives to deal with the agribusiness unit on their behalf, one has to be rather cautious about these arrangements.

3.6.3 The food processing sector is dominated by small-scale producers including traditional village industries. However, the link up of small units with the large units including MNCs has not developed adequately. A system where initial processing could be decentralized in the rural areas in small units [creating employment and reducing transport costs] and the final processing, quality control, packaging and marketing under brand name could be done in a centralized manner
[by a farmer’s organisation or other business unit] has not developed. One reason for this is the lack of assured electric power in the rural area and also the high cost of power to the industry. Poor road connectivity is another constraint in developing decentralized food processing units in the rural areas. There is need for policy environment to support the above developments.

3.6.4 There is also a need to rationalise the tax structure for food processing industry and value addition. The agriculture sector is exempt from all taxes [like excise, income tax etc] but there are inter-State differences in agriculture cess, sales tax, mandi tax, octroi, inter-state transfer regulations etc. At the point of conversion i.e., value addition, excise, income tax and other taxes are levied. The packaging material used is also subject to taxation. All these taxes add to the costs which make processed food quite costly limiting its demand/market. The world demand of processed food is increasing. The need is to develop a competitive food processing sector. Though it may not be easy to build up a large export component in processed food, at least all attempts are needed to ensure that our growing market for processed food is not completely lost to imports.

3.6.5 Quality standards in food processing sector are extremely important for the market particularly the export market to bring our food products at par conforming to international safety and quality standards, it would be essential to set up a network of quality testing/certification laboratories across the country and also build the awareness level of our farmers, processors and traders regarding codex requirements in respect of food hygiene, food additives, pesticides residue, contaminants, labeling, presentations and methods of analysis and sampling. All products meant for sale have to be packed and labeled as per codex requirements.

3.7 The General Employment Strategy for India

3.7.1 Dr. C. Rangarajan in his V.V. Memorial Lecture [2005] has indicated that the overall employment strategy in India must seek to achieve two things. First, create productive employment opportunities to absorb the annual addition of 8 million or more labour force and second to improve the ‘quality’ of employment in several sectors such that real wages rise through improved productivity. According to him the four components of the employment strategy should be:
i) Accelerating the rate of growth of the economy;

ii) Special emphasis on relatively more labour intensive sectors and inducing a faster growth of these sectors

iii) Improving the labour skill endowment in general, paying particular attention to identifying specific skill gaps and taking effective steps to fill them; and

iv) Improving the functioning of the labour markets through such modification as may be necessary without eroding the core labour standards.

3.8 Conclusion

3.8.1 There is a general feeling of being ‘left behind’ in large parts of rural India. The widening disparity in per capita income between farm and other than farm sector, the very slow rate of growth in agriculture, the declining profitability, extremely weak social security arrangements, weakening family and community based mechanism of social protection, lack of employment opportunities etc., and the rising aspirations are building up social unrest which if not arrested could lead to threats to internal peace and security. Economic growth which bypasses a large population is joyless growth and not sustainable in the long run. Equity considerations can not be ignored for too long. Faster growth in agriculture with improvement in welfare of the rural population is important. The need is not only to register increase in agriculture production in million tons but actual improvement in rural incomes. The promises that a 9 or 10% growth rate for a decade would solve employment problem may be mathematically correct but may leave many serious problems in its trail if we do not build an effective social security net and take appropriate policy steps to improve the income of the assetless or those with very limited assets. The need is to ensure a faster and more inclusive growth as indicated in the draft approach paper to the XIth Five Year Plan. It is not too late to mount a major offensive against the deepening crises in rural areas. However, let us not forget, the time for action is also fast running out.
Appendix - I

Break-up of average monthly income (excl. rent, interest, dividend etc.) per farmer household by source in each of the major States during the agricultural year 2002-03.

CHAPTER 4

ATTRACTING AND RETAINING YOUTH IN FARMING:
UNCOMMON OPPORTUNITIES

4.1 Introduction

4.1.1 Agriculture continues to be central to the livelihood security of a majority of the people of India. As poverty is more extensive in rural areas and is concentrated in the small, marginal and landless farming households, which account for nearly 60 per cent of the country’s population, efforts towards its alleviation must have in place an explicit agricultural growth strategy aimed towards remunerative employment and sustained income growth. With the persisting serious yield and productivity gaps on one hand, and the centrality of high competitiveness on the other, our agricultural development must become increasingly knowledge-intensive and efficient. For this, the youth, especially the agricultural graduates, practising science- and knowledge-based agriculture, should constitute the torch-bearers of agricultural transformation in the globalised world. But, the agricultural graduates and other educated youth, although unemployed, are rarely taking to farming as a profession and it is difficult to retain even a small number of them in rural areas.

4.1.2 The worsening cost-risk-return structure of farming, the low and stagnating income of farmers and the huge and widening income divide between farmers and non-farmers are the main deterrents. So much so, as per the 59th Round of NSSO, 40 per cent of the farmers wish to quit farming. This is a serious concern and must be addressed urgently. The youth can be attracted to and retained in farming only if farming becomes economically rewarding and intellectually satisfying, and only when the rural settings encompass the barest minimum necessary energy, infrastructural, educational and primary health care facilities. In this context, the Provision of Urban Amenities in Rural Areas or PURA programme proposed by the President of India becomes important. Moreover, the process must be accompanied with suitable policies
and access to appropriate technology, services, institutional support including credit, and markets and remunerative prices.

4.2 Youth in India

Number, Literacy and Employment Status

4.2.1 Ours is a land of the youth. The National Youth Policy 2003 defines the youth in the age group of 13 to 35 years, but classifies them in two sub-groups viz. 13-19 years (adolescent age group) and 20 to 35 years. In 1997, the number of youth was about 380 million, 37% of the total population, and is anticipated to increase to about 510 million in 2016, about 40% of the total population. Nearly two-thirds of these will be rural youth. The availability of such a huge highly active human resource offers unique opportunities for achieving equally huge socio-economic transformation. But, this will call for commensurate training, skill and knowledge development opportunities, technological excellence and enabling mechanisms.

4.2.2 By the year 2016, about 246 million youth will be female and 264 million will be male. The gender divide is particularly sharp in literacy rate. Against 25% illiterate males, 46% of the female are illiterate (11th Plan Approach Paper, 2006). As a whole, India is home to one-third of the world’s illiterate youth (UNESCO, 2004), and more than 60% of these are female. Consequently, and also due to other reasons, more women than men work in low-status jobs. Thus, the differences in educational status and economic empowerment will have to be narrowed and eliminated as we move towards more inclusive growth. With the increasing feminization of agriculture, women contribute more than 50% of the agricultural workforce, particularly in hill areas. Considering the prevailing gender inequality, special effort must be made to empower women technologically for increasing their work efficiency, reducing drudgery and increasing income. Women’s education and training, thus, should receive greater emphasis.

4.2.3 With about 13% of its youth unemployed, India has the largest number of unemployed youth in the world. The figures vary from State to State, being as high
as 35% in Kerala. There has been increasing concern among policy makers that the frustration that accompanies long-term unemployment among groups of young people feeds political and ideological unrest and violence. It has also been argued that unemployed and idle youth, who have emerged in society as part of a large “demographic bulge” may question the authority of government and endanger its stability. The upsurge in naxalite movements and terrorism in recent years may partly be ascribed to the increasing high unemployment. These “left out” human resources should be empowered to employ themselves in farming and allied activities, thus mainstreamed in the nation building process.

4.2.4 India’s labour force generally remains low-skilled and illiterate – on an average the labour force has 4 years of education; more than 42% has no education and only 6% has tertiary (college) education (Table 1). Women have education attributes that are significantly worse – the vast majority have no education and only 4% have college education. The high illiteracy and unemployment or underemployment rates are closely linked with the high incidence of poverty and hunger in the country. Currently, about 80 million youth, age group 15 to 24, live on less than one dollar a day, and about 200 million young people live on less than two dollars a day accounting for about 35 per cent of the world’s youth in these categories. Likewise, nearly 45 million or 28% of the world’s 160 million undernourished youths have their homes in India (Curtain, 2004).

| Table 1: Levels of Education of the Labour Force (1999/2000) |
|-----------------|-----------------|-----------------|
| **Average years of education** | **No education [%]** | **Tertiary Education [%]** |
| All | 3.9 | 42.4 | 6.3 |
| Male | 4.6 | 33 | 7.3 |
| Female | 1.9 | 68.3 | 3.7 |
| Source: Ghose (2004) |

4.2.5 As regards the sectorwise distribution of the labour force, about 56% is engaged in agriculture, down from 65% in the early 1990s. It is important to note that although the share of agriculture in total GDP has dropped to about 20%, its share in employment is still very high, emphasizing the social value of the sector and its
importance for livelihood security of the average citizen – the social inclusion dimension.

4.2.6 Of the remaining labour force, about 13% are engaged in manufacturing and the balance are employed in the service sector which has grown from 25% to 32% of total employment over the past two decades. The organized sector provides about 8% of the total jobs and the remaining 92% is provided by the informal or unorganized sector. It is estimated that the country’s labour force is currently growing by 7.5 to 8 million persons per year. But, sadly enough, only about 6% of India’s workforce has received formal training in vocational skills, compared with 60% or more in developed and most rapidly developing countries.

4.2.7 Even though the economy has been growing at 6 to 8 per cent per annum during the past few years, there has been limited impact on job creation in the rural economy. The process of growth in the future thus must pay attention not only to the GDP growth rate, but also to growth pattern of employment. The employment growth rate in the rural areas is continuously decelerating, dropping from 2.12 percent during the decade ending 1983 to 0.68 percent during 1993/94 to 1999/2000 (Sheela Bhalla, paper prepared for NCF, 2005). The fall was much steeper in the agricultural sector as compared to that in the non-farm sector. A reduction in proportion of the population employed in the primary sector is a natural and inevitable trend that is spurred by rising expectations and changing attitudes as much as due to rising levels of farm mechanization. However, this does not mean that the potential for employment in the agriculture sector is being fully exploited. Strategic initiatives to modernize and diversify Indian agriculture, both horizontally and vertically, particularly in the areas of post-harvest management and farm-level processing and value addition, can generate quality employment opportunities for a very large number of rural people. The livestock, horticulture and fisheries sub-sectors are growing at about 3 to 5 per cent per annum, against growth rates of 0 to 1.0 per cent in crops, thus offer greater employment opportunities.
4.2.8 The State-wise data show that there was overall negative annual growth of rural employment during 1993-94 to 1999-2000 in Goa, Himachal Pradesh, Tamil Nadu, Tripura and Arunachal Pradesh. In Andhra Pradesh, Karnataka, Maharashtra, Rajasthan, West Bengal and Meghalaya the growth rate was positive but below the national level of 0.68%. The negative or extremely low growth rate of employment in some of the larger States like Tamil Nadu, Himachal Pradesh, Andhra Pradesh, Karnataka, Maharashtra, Rajasthan and West Bengal is very disturbing. Incidentally, Maharashtra, Andhra Pradesh and Karnataka which had registered very low rural employment growth during 1993-94 to 1999-2000 are also States where many farmers have committed suicides during the last five years, and the tragedy continues.

4.2.9 One of the main considerations of the youth in adopting farming as the means of his/her livelihood security is its economic viability. At the national level, the average monthly income of farmer household is Rs. 2115, with considerable inter-state variation, ranging from around Rs. 5,000 in Jammu and Kashmir and Punjab, around Rs. 4,000 in Kerala, Rs. 3200 in Assam, between Rs. 3000 and 2000 in most States and between Rs. 2000 and 1000 in Bihar, Andhra Pradesh, Uttar Pradesh, Chhattisgarh, Rajasthan, Madhya Pradesh and Orissa, in that order being only Rs. 1062 – the lowest in Orissa (NSS, 2002/03). On an average, nationally, cultivation, wages, non-farming business and animal farming, respectively, contributed 46, 39, 11 and 4 percent of the total monthly income. The scope of livestock for increasing farmers’ income and employment is generally highly under-exploited. Agricultural and non-agricultural employments must complement each other. For an agricultural graduate to return to village, he/she should have diversified opportunities for income generation. Therefore, we suggest an integrated Rural Livelihood Initiative.

Educational and Training Institutions

4.2.10 **Agriculture, Veterinary, Animal Sciences and Fishery Universities:** The National Agricultural Education System, one of the largest in the world, comprises 39 State Agricultural Universities (SAUs), 5 Deemed Universities (DUs), 1 Central Agricultural University (CAU), 3 Central Universities with Agricultural Faculty, 207
Agricultural Colleges and 50 Private Agricultural Colleges. The SAUs include 2 Veterinary and Animal Science Universities, 2 Animal Science and Fisheries Universities and 1 Horticulture and Forestry University. In addition, one Indian Institute of Technology and 16 State General Universities offer degrees in Agriculture and Allied Disciplines. The System imparts Bachelor’s level education in 11 broad disciplines which include Agriculture, Horticulture, Fishery, Forestry, Home Science, Sericulture, Dairy Technology, Agricultural Engineering, Food Science Technology, Agri-Business (including Marketing), Banking and Cooperation, Master of Science (M.Sc.) degree in as many as 95 specialized disciplines of Agriculture and Allied Subjects and Doctor of Philosophy (Ph.D) degree in 80 agricultural disciplines.

4.2.11 While the agricultural education grid of the nation has produced a large number of talented graduates and post-graduates, over 40 per cent of the farm graduates are unemployed. The mismatch between employment and education may be assumed partly to the following weaknesses in the education system:

- Lack of desired responsiveness to the changing scenario and temporal needs, especially in the Home Science
- Lack of competence, confidence and entrepreneurial ability
- Paucity of required upgradation, competence and skill development opportunities
- Inflexible, mismatch between theory and practice leading to the lack of risk bearing capacity and confidence
- Lack of adequate updating and modernisation of curricula and resources.
- Recalcitrancy to broaden the base of education for agriculture.

4.2.12 Skill development is important especially for the knowledge-based precision agriculture. Strengthening education and skill building need the attention of both the Government as well as the private sector in association with the academia. Isolation of education (even training) from the ground realities is the basic flaw of the Indian system. A serious mismatch is observed between the needs of the modern agriculture and the availability of skilled manpower. In spite of surplus graduates in general agriculture, deficits were witnessed in post-harvest management, agroprocessing, value
addition, packaging, marketing, veterinary care, integrated management of pests and diseases, handling of bioagents and application of quality standards. If Indian agriculture has to grow at around 4 per cent per annum, it will be necessary for the education and training system to produce at least 100,000 technically-skilled people every year. Notwithstanding the need for an analytical analysis and estimation of number, quality and discipline-wise requirement of trained and educated agricultural experts and preparing the necessary roadmap to achieve the target, it is estimated that the country would need an incremental requirement of about 1.5 million skilled technicians by 2015. As we move up the technology ladder and begin to produce modern products in greater volumes and provide efficient services, particularly in the fast expanding private sector, qualitative growth in skilled manpower is essential.

4.2.13 Towards women’s technological empowerment, Home Science education needs to be totally reorganized. The training during the first 3 years can deal with general topics in science and nutrition. But the final year should provide a number of options such as management of biodiversity and biotechnology, Horticulture, seed technology, food technology, renewable energy management, information technology and GIs mapping. Home Science Colleges should be named and structured as Colleges of Agricultural Technology and Nutrition for Women so as to reflect the technological and skill empowerment of women in market-driven technological enterprises and sustainable management of natural resources, and not just home occupation. Since, issues relating to nutrition security and post-harvest technology are equally important for men, some of the Home Science Colleges can be developed in Colleges of Human Sciences.

4.2.14 ICAR Institutes: The Indian Council of Agricultural Research (ICAR) is the apex organisation for conducting and coordinating agricultural research, education and extension. It comprises 4 National Institutes, 45 Central Institutes, 31 National Research Centres, 12 Project Directorates, 5 Bureaus and 91 All India Coordinated Research Projects, besides nearly 500 KVKs. With more than 20,000 scientists working for the system, the Council is one of the largest agricultural research systems in the world. Alleviating hunger, providing employment and increasing farm income through the development of new technologies, their effective transfer and the generation of
appropriate human resources are the major mandates of the Council. Each ICAR institute has a strong component of training for generating adequately trained boys and girls to strengthen agrarian economy in the country. The effort has succeeded to a considerable extent, but, in recent years, employability of the educated agricultural human resources has declined rather sharply.

4.2.15 **Krishi Vigyan Kendras (KVKs):** Krishi Vigyan Kendras (KVKs), numbering nearly 500, each district likely to have at least one KVK, constitute one of the most eminent institutional networks to impart technical literacy by using the pedagogic methodology of learning by-doing. Presently, KVKs are functioning almost independently with overall direction and supervision of the ICAR/or State Agricultural Universities. Their coordination with State Government is not up to satisfaction. It is essential to restructure the KVKs so that their activities are integrated with those of other relevant institutions for more effective agriculture extension and human resource development efforts. It is understood that ICAR is considering Report of a Committee set up for this purpose. In view of the resources, expertise and infrastructure facilities available with KVKs, it is necessary for them to take higher responsibility in providing better quality services to the farmers both at the production and post-harvest phases of farming.

4.2.16 With the onset of an era of low external input sustainable agriculture (LEISA) imparting new skills and information empowerment has become vital. Organic farming and ever-green revolution are also more knowledge intensive than chemical farming. The KVKs should thus become the hubs of the agriculture led transformation of Indian economy. They should train large number of **Soil Health Practitioners** in villages and should provide services to safeguard soil, plant and animal health and irrigation water quality. They should provide training in precision farming methods leading to land and water-saving farming practices. They should develop expertise in post-harvest technology, particularly in perishable commodities like vegetables, fruits, flowers and animal products. Accordingly, as suggested in the First Report of NCF, **the Krishi Vigyan Kendras should be renamed and restructured as Krishi Vigyan and Udyog Kendras.**
4.2.17 Young graduates and entrepreneurs can be trained by KVKs to set up their self-employment ventures and enterprises for providing quality service to farmers with superior technology. In collaboration with the restructured and reinvigorated Small Farmers Agri-business Consortium (SFAC), KVKs can prepare model project reports for such ventures to take up entrepreneurial activities. They should generate awareness about issues relating to bio-conservation, bio-security, safe application of biotechnology and the rights enjoyed by farmers under law. They may also impart training on issues relating to credit, insurance and other related areas. Depending on location, some KVKs may specialize in specific areas like agroprocessing and post harvest management of specific commodities, organic farming, medicinal and aromatic plants, and rural infrastructure for better learning. They should be connected to Village Knowledge Centres (VKC) or Gyan Chaupals and actively promote gene, biosafety, quality and food safety literacy of the farmers and other stakeholders. Finally, KVKs should function as a resource center for Agriculture Technology Management Agency (ATMA) and other such agencies, and work in congruence with them.

4.2.18 **CSIR Institutes Related to Agriculture and Food:** More than a dozen Institutes of the Council of Scientific and Industrial Research (CSIR), such as, Centre for Cellular and Molecular Biology, Hyderabad, Central Food Technological Research Institute, Mysore, Central Institute of Medicinal & Aromatic Plants, Lucknow, Institute of Microbial Technology, Chandigarh, National Botanical Research Institute, Lucknow, Central Leather Research Institute, Chennai are conducting quality technology generation and transfer programmes related to agriculture, food and rural development.

4.2.19 The ICAR, Ministry of Agriculture, Ministry of Rural Development and Ministry of Food should be closely linked with these Institutes and laboratories which have tremendous impact on training, attracting and retaining youth in farming and other rural enterprises. For instance, the Central Food Technological Research Institute (CFTRI) offers an extensive range of programmes of academic as well as industrial importance that attract participants from many regions of the world. The International Food Technology Training Centre (IFTTC) and the International School of Milling
Technology have trained a large number of national and international young scientists, several of them being self-employed entrepreneurs. The Institute also runs continuing education programmes. Its Industry-Oriented Short Courses offer national as well as international level short-term courses (of 1-3 weeks duration) on a continuing basis for technical staff from food and allied industries, academic centres and R&D units, to keep them updated on the current and emerging trends in specialized as well as general areas of food technology. Eighteen of these courses are of particular interest to farm graduates and Farming Youth. These courses also provide a forum for the R&D scientists to interact and build synergy with the industry.

4.2.20 Jamsedji Tata National Virtual Academy for Rural Prosperity: The Jamsedji Tata National Virtual Academy (NVA) of the M.S. Swaminathan Research Foundation has taken key steps of training grassroot workers to use ICTs for agriculture and rural development. The NVA aims to convey such knowledge directly to villages thereby empowering rural and tribal families to achieve a better control of their own development and to build skills and capacities relevant to enhancing opportunities for sustainable livelihoods. These trained persons will constitute the “core competence of rural India” and serve as agents of change in rural India. The Academy is emphasizing pedagogic methodology of learning by doing to bring about a learning revolution in villages. NVA Fellows represent a wide range of competencies and expertise – agriculture, education, micro-finance, environment, health, marketing, disaster management and numerous other fields. Some have, with tremendous grit and determination, raised themselves out of dire poverty or difficult life circumstances to undergo training and acquire skills for self-employment, which they have in turn shared for the benefit of their community. The aim of NVA is to enroll one million Fellows (about one woman and one man for every village) by the year 2010. They will become the torchbearers of the Rural Knowledge Revolution.

Farm Graduate and Post Graduate Outputs and Employment Status:

4.2.21 India annually produces nearly over 22,000 Agricultural Graduates and Post Graduates. One-fourth of these are women. About 40% of the Graduates remain
unemployed or highly underemployed or misemployed. Often, they hail from rural areas belonging to poor to average farming families. However, this is not true uniformly throughout the country. For instance, one-fourth to one-third of the horticultural graduates from the Karnataka Agricultural University get employment, mostly in banks and private sectors, and most of the remaining two-thirds proceed for higher studies. However, this is not the case for a large number of graduates coming out from private agricultural colleges in the North. For instance, in Haryana, there is hardly any opening for farm graduates in the public sector, about 5 percent are getting absorbed in private sector, about 10-15 percent are proceeding to do M. Sc. Ag, about 8-10 percent are diversifying for MBA and other professional Master degrees and remaining about 70 percent are unemployed. A good number of the unemployed end up doing M.Sc. Ag without adding to their employability.

4.2.22 Employment potential of the various fields of graduation differs significantly. Currently, the potential is: Good in: Veterinary, Dairy Technology, Food Technology and Fisheries; Intermediate in: Agricultural and Engineering and Horticulture and Forestry; and Poor in: Agriculture and Home Science.

4.2.23 The World Science Report (UNESCO, 1993) had revealed that during the 1980s, total number of agricultural and veterinary graduates in India had registered a growth rate of 4.1 percent and 3.4 percent, respectively. Availability of scientists in agricultural research and education was 0.028 per 1000 population against 0.1 per 1000 population for the world as a whole. A survey (1994) of supply-demand scenario of trained manpower in agriculture by 2005 had projected a shortage of trained manpower by 113,000. The M.S. Swaminathan Committee on Education for Agriculture, ICAR, 1998, had observed that (i) There is need for at least one farm graduate for each Gram Panchayat and Nagar Palika, projecting the requirement of 0.7 million farm graduates, (ii) There is an urgent need for increasing the number of Veterinary Graduates, (iii) There are serious regional disparities in the availability of farm graduates, and (iv) Private sector is emerging as a big employer in agriculture and allied fields, including R&D, farm production, seed development and multiplication, agro-processing, post-harvest
technology, dairy production and processing, poultry, meat and meat products, food-processing, biotech products, health products and extension services.

4.2.24 As per available estimates of Applied Manpower Research Institute (AMRI 2000), up to the year 2000 the country produced about 166,200 graduates in agriculture and allied areas, 78,200 post graduates and 11,400 doctorates. The employment pattern of agricultural graduates during this period has been to the tune of 50 per cent in public sector, 20 per cent in private sector, 12 per cent in research and academics, 6 per cent in financial institutions including NGOs, only 2 per cent self-employed and the remaining 10 percent in other spheres. The AMRI analysis had revealed that 43 per cent of agricultural graduates and 23 per cent of the post-graduates were unemployed. Due to economic shifts and changes in growth pattern, the employment situation has worsened. The temporary positions of Research Associates and Research Fellows in time bound short term projects add to the gravity of the problem and the uncertain prospects of regular employment of thousands of such graduates and mostly post-graduates is indeed pathetic. The paradox of co-existence of the huge unmet demand on one hand, and the huge “idle” supply (unemployed graduates) on the other, is a matter of great concern and calls for urgent and priority redressal of the mismatch.

4.2.25 Regional imbalances in agricultural growth are increasing. North East India is a case in point. The Swaminathan Committee on Agricultural Research (Planning Commission, 2004) has recommended the creation of a sub-cadre in the Agricultural Research Service (ARS) of ICAR for the North East. This will help a large number of young women and men farm graduates to render life-long service to their respective States in this natural and human resources rich region.

4.3.0 Pre-requisites for Attracting and Retaining Youth in Farming

Rural Infrastructure

4.3.1 Fortunately, several significant initiatives have been taken by the Government in recent years to improve the situation on the infrastructural and other related fronts. Some of the important initiatives are: Bharat Nirman, National Rural Employment
Guarantee Programme, Sarva Shiksha Abhiyan, National Rural Health Mission, Enhancement of Agricultural Credit and Lowering of Interest Rate, National Horticulture Mission, National Rainfed Area Authority, National Fisheries Development Board, Changes in the APMC Act (to make it farmer-friendly), Warehouse Receipt Act (making warehouse receipts a negotiable instrument, thereby helping to prevent distress sales), and Knowledge Connectivity through the e-governance and Every Village a Knowledge Centre/ Gyan Chaupal programmes. The time is therefore opportune for the graduates to avail of the above initiatives and return to rural areas for helping to revitalize our agricultural progress by making agrarian prosperity the bottom line of government investment and agricultural and rural development policies leading to increased employment opportunities for farm graduates.

4.3.2 **Bharat Nirman**: Bharat Nirman is a time-bound programme to foster job-led economic growth in villages and to bring about a shift from unskilled to skilled work in the case of women and men without assets like land, livestock or fish pond. Improved communication (roads and telephones) and provision of electricity will help to open up new opportunities in the rural manufacturing and trade sectors. Ten million hectare additional agricultural land will be brought under irrigation, thus greatly enhancing agricultural productivity and sustainability and farmers’ income. Bharat Nirman’s thrust on knowledge connectivity through Gyan Chaupal or Village Knowledge Centre will bring unprecedented knowledge-driven socio-economic transformation in our villages, particularly in the removal of many intermediaries causing the market and income slippage.

4.3.3 **PURA (Providing Urban amenities in Rural Areas)**: PURA is an example for creating rural wealth and prosperity. Knowledge powered rural development is an essential need for transforming India into a knowledge power and high bandwidth rural connectivity is the minimum requirement to take education, health care and economic activities to the rural areas. Knowledge society leading to knowledge super power can prosper and survive only in the environment of economic security and internal security. Physical connectivity by providing roads, electronic connectivity by providing reliable communication network and knowledge connectivity by establishing professional
institutions and vocational training centers will have to be done in an integrated way so that economic connectivity will emanate, as exemplified by the Byrraju PURA (Andhra Pradesh), Periyar PURA (Tamil Nadu), Loni PURA (Maharashtra) and Chitrakoot PURA (Madhya Pradesh) the Hon’ble President had observed, “The operational PURA system has increased the literacy rate, brought down the infant mortality rate, created employment opportunities for the people, increased the per capita income of the villagers and brought the smiles in the faces of villagers in that PURA cluster. In all these three PURAs, employment generation was the focus using technology experiences from the colleges and educational institutions and through assessment of markets, which can absorb the products and services.” The experience is being replicated at a faster rate and would prove instrumental in attracting and retaining the youth in farming.

4.3.4 Sarva Shiksha Abhiyan (SSA): Education is the most critical element in empowering people with skills and knowledge and giving them access to productive employment in the future. A major step was taken by the Government of India in 2004-05 to ensure effective funding of elementary education by the levy of 2% Education Cess earmarked for the Sarva Shiksha Abhiyan. The Mid Day Meal Scheme, Integrated Child Development Scheme and Early Childhood Education should be integrated with SSA and education should universalized upto High School or Class X. Agriculture should be made a compulsory subject upto High School. Specific educational curricula focusing on the needs of rural youth can enthuse them towards agriculture and enhance their skills.

4.3.5 Government Programme on Youth for Leadership in Farming (GPYLF): The ICAR should hold hands of selected rural school children at secondary level who have an aptitude and means to adopt farming as their profession. To begin with, depending on size of the State, about 50 to 150 boys and girls should be identified from each State to participate in one-week programme at an ICAR Institute or SAU or a Farm School in the region. The young minds should feel the thrill and excitement of science-based agriculture and critical appreciation of scientific principles. It should also aim at active participation in the learning process through experimentation and putting into practice the knowledge acquired in the classroom. The efforts should motivate young
people to take to agriculture as a profession. This will expose the young-ones to the multi-functionality of agriculture and the thrill of making a good living in a healthy and vibrant green environment. The interested ones should be supported to undertake repeat visits to sustain and further intensify their confidence in knowledge-led agriculture.

4.3.6 **National Rural Health Mission:** A seven year National Rural Health Mission (NRHM) has recently been launched to address infirmities and problems across rural primary health care. The Mission would converge the public health approach into primary health care and aims to empower and support Panchayati Raj institutions to manage, administer and be accountable for health services at community levels. It aims at effective integration of health concerns with determinants of health like safe drinking water, sanitation and nutrition through integrated District Plans for Health and aims to introduce effective risk proofing mechanisms and social health insurance and take advantage of local health traditions. **A Nutrition-cum-Drug Based Approach** to support rural families affected by HIV/AIDS, tuberculosis, malaria and leprosy is needed to assist in recovery and restoration to a productive life. The “sick” farmer is not able to undertake his farming duties. Therefore, is Approach should become an integral part of the National Rural Health Mission.

4.3.7 **National Horticulture Mission:** The Government has accorded high priority to horticulture by having launched the National Horticulture Mission (NHM). The Department of Agriculture and Cooperation has allocated Rs 1951 crore to NHM for the Annual Plan 2006-07 out of the total allocation of Rs. 4800 crore to Agriculture as a whole. While this huge 41 percent of the total outlay allocated to NHM underscores the pivotal role that the horticulture sub-sector is expected to play in the national economy, we hope that, unlike its forerunner project “Horticulture Technology Mission”, the benefits of NHM will reach the small and marginal farmers as well as to landless agricultural workers.

**Non-Farm Employment**

4.3.8 NSSO data 1999-2000 had revealed that in rural areas, of the employed 305 million people, 232 million people or 76% were employed in agriculture as compared to
73 million or 24% in non-farm sector. The employment elasticity of labour in the agriculture sector is now very low. Almost all the rural employment growth in the last few years took place in the unorganized Non-Farm sector - between 1993/94 and 1999/2000 almost 12 times of that of Agriculture. The opportunity in the Non-Farm sector must be captured so as to improve the income and livelihood security of the rural people and also to provide stimulus to agricultural growth, thus attracting more and more youth to take to farming and related businesses in villages and rural townships, integrating the on-farm and non-farm employment.

4.3.9 Thus, there has to be a two-pronged strategy for attracting and retaining educated youth in farming. Farm graduates who own land should be encouraged to take to farming as a profession. Farm Schools on the lines recommended by NCF in its First Report, could be established in the fields of such farm graduates who are operating agricultural enterprises efficiently. Secondly, farm graduates who do not own land can be assisted to provide demand driven services through Agri-clinics, Agri-business centres, Food Parks, etc. There should be Capacity Building and Mentoring Centres to assist farm graduates to set up Agri-Clinics and Agri-Business Centres. To the extent possible, groups of 3-4 Graduates can be formed for running these enterprises. For providing Mentoring and Hand-holding Services, professors and scientists as well as NGOs could be enlisted. Arrangements should also be made for the farm graduates to undergo apprenticeship in suitable Companies. Concurrent attention should be given to on-farm and non-farm employment so as to optimise their synergism.

4.3.10 A study commissioned by the NCF had revealed that three pillars are important for creating non-farm employment opportunities. Firstly, the foundation for accelerated employment and labour productivity growth in the non-farm sector is infrastructure investment. For the non-farm sector, the key components are reliable electricity supply, all weather roads and access to landline telephone facility. Secondly, access to affordable and timely credit is crucial. It should be available for medium scale as well as tiny and small-scale units and for expansion of existing units as well as for start up of new units. Credit should be provided by formal sources which should pay special attention to productivity raising investments, for example, the motorization of previously
manual labour operations in carpenter’s shop. Thirdly, the non-farm development thrust should be directed to particular sector and sub-sectors where demand for the product or services is growing, namely, trade, transport, construction, repairs and certain services.

4.3.11 The food-processing sector is dominated by small-scale producers including traditional village industries, although some very large companies have lately entered this sector. However, the link up of small units with the large units has not developed adequately. A system should be developed where initial processing could be decentralized in the rural areas in small units [creating employment and reducing transport costs] and the final processing, quality control, packaging and marketing under brand name could be done in a centralized manner [by a farmer’s organisation or other business unit] near or in a city in an integrated manner. In order to bring our food products at par conforming to international safety and quality standards, it would be essential to set up a network of quality testing/certification laboratories across the country and also build the awareness level of our farmers on food safety, quality and trade. Thousands of suitably trained human resources are required towards this movement.

Mechanisms and Institutions for Non-Farm Employment

4.3.12 A series of institutional, structural and strategic arrangements have been made and proposed from time to time to provide non-farm employment. These include: Khadi and Village Industries Commission (KVIC); National Rural Employment Guarantee Programme (NREGP); Agri Export Zones (AEZs); Technology Parks such as Biotech Parks, Food Parks, Textile Parks; Small Farmers’ Agri-business Consortium (SFAC); and Food, Fodder, Feed, Seed and Gene Banks.

4.3.13 Khadi Village Industries Commission: KVIC, with its 30 State khadi and village industries boards, over 3,500 institutions, over 29000 cooperative societies, 14200 sales outlets and its Boards assisting over 5 lakh artisans and having reached 2.35 lakh villages, is perhaps the largest retailing system in the country. But, its potential in the marketing system has not been fully exploited. To bridge this gap, a good number of
corporate houses have entered the retailing sector. KVIC should modernize and strengthen itself to energize the rural marketing system. SFAC, started by Dr. Man Mohan Singh, the then Finance Minister in 1992; which is yet to prove its utility of enabling small farmers to take to market driven agri-business, should join hands with KVIC in the process of setting up technical back-up units interface (TBU/Interface) with several institutes in the country to provide thrust to entrepreneurship programmes supported by strong science and technology research inputs for production activities utilizing local resources and local skills of the people. This modernized huge network should be able to provide quality employment to thousands of Farm and other Graduates in the rural areas and provide the missing market infrastructure to directly link farmers with the market.

4.3.14 **National Rural Employment Guarantee Programme (NREGP):** Work, water and power are the triple needs of rural India for accelerating economic development. NREGP will particularly promote inclusiveness and help in building rural assets particularly in these areas which would increase sustainable income generating opportunities in the rural areas and the programme should favour the unemployed youth, rural women, the tribals and the other distressed people. The ultimate aim of NREGP must be to train/retrain and improve the human capital from unskilled to skilled so as to enhance employability of rural people who could more effectively and sustainably contribute to the rural reconstruction process.

4.3.15 **Agri Export Zones:** The 60 AEZs already notified by the Government in 20 States also provide unique opportunities for self-employment of educated youth who could deliver an appropriately priced and attractively packaged quality product in the international market. APEDA supplements, within its schemes and provisions, efforts of State Governments for facilitating such exports. The products covered are mostly horticultural – fruits, vegetables, potatoes, flowers, medicinal and aromatic plants. Basmati rice, quality wheat in Madhya Pradesh, sesame seeds, vanilla, seed spices, lentil, gram and Darjeeling tea are also included. Performance of the AEZs has, however, been uneven. A peer evaluation has been conducted to assess the strengths and weaknesses and to suggest remedial measures. Action plan to give impetus to the scheme is being
framed. This initiative should be linked with related KVIC Programmes and activities to leverage employment of farm graduates and other educated youth. Some of the non-performing AEZs could be converted into Rural Economic Zones (REZs) with a broader objective of attracting the private sector to develop rural infrastructure, efficient and reliable inputs supply and rendering effective extension services geared for competitive and enhanced agricultural production and distribution. The Government should provide necessary fiscal and other concessions to the private sector, as being currently done for the AEZs. The move will create a good number of both on-farm and non-farm jobs. If successful, the model should be widely adopted. The recent initiatives of some of the leading corporate houses, the moves on farmer-friendly contract farming, NREGP and Rural Business Hubs should converge within the Rural Economic Zones through the Pan- Ministerial arrangement proposed by NCF.

4.3.16 **Technology Parks:** In order to provide end-to-end connectivity and to ensure backward-forward linkages among various components of production-processing-marketing chains, Technology Parks – Biotech Parks, Food Parks, Textile Parks etc are being rapidly established. As far as possible, these parks may not be located in large cities but should be strategically established in smaller or satellite towns contiguous to rural areas with effective transport, communication and market linkages. A good example is the Womens’ Biotechnology Park functioning in Siruseri village near Chennai. These parks should work on the lines of IT Parks so as to attract farm graduates and other Graduates with experience in Agri-Business and entrepreneurial development. The parks must become hubs of outsourcing of products of international quality, such as designer hybrid seeds, vitrocultured material, bio-pesticides, bio-fertilisers, etc. which will be particularly conducive to the expansion of organic farming. With the termination of the textile quota regime in textile importing countries, textile parks in India have huge opportunities to expand textile and garment export and thus generate sufficient additional employment. **Such parks will exert a “pull” for provision of quality raw materials and promote congruence between off-farm and non-farm employment.**

4.3.17 **Food, Water, Fodder and Feed Banks:** Food Banks or Community Grain Banks are an important component of food security package. These are congruent to the
Public Distribution System (PDS) to enhance access to food on part of the poor as well as to widen the food security base by including wide range of millets, grain legumes and tubers. Likewise, Community Water Banks, consisting of augmented supplies, demand management through the principle of “more crop per drop”, and harnessing new technologies for enhanced water use efficiency, should be established. As detailed in NCF Second Report, about 1200 Fodder and Feed Banks should be established at strategic sites, with priority in rainfed arid and semi-arid zones. These Banks should be created at Panchayat Samiti level and managed preferably with the help of SHGs and Small Farmer Estates involving also farm graduates and other youth.

4.3.18 **Seed Banks:** Seed Banks, particularly established and managed by farm graduates, could be a full time quality Non-Farm employment avenue. The Seed Banks are important especially for ensuring contingency crop production in the event of droughts and floods and other natural disasters as well as for ensuring timely planting. Seed villages for different crops, strategically located throughout the country, with at least one Seed Bank located in each large village are cluster of small villages, will ensure better income not only from seed production but also from enhanced and sustained production.

4.3.19 **Gene Banks:** Under the National Protection of Plant Varieties and Farmers’ Rights Act, the farmers and other rural communities should collect, conserve, document and utilize the indigenous genetic resources and establish Community Gene Banks. These Banks should be operated by farm graduates and other enlightened youth and should be linked with the National Gene Fund and National Biodiversity Fund. The efforts of the grassroots people in conserving the genetic resources should be duly rewarded under the Farmers’ Rights. State Farms could be used for developing **Living Heritage Gene Banks** of the Germplasm of local breeds of cattle, sheep, poultry, etc. and, wherever possible, they should be handed over to farm graduates or farmers’ organisations or NGOs for management on scientific lines and should be monitored by a committee consisting of local farmers’ representatives, scientists and NGOs.
Synergy Among Employment Programmes: Pan Ministry of Agriculture- Ministry of Rural Development Initiative

4.3.20 All programmes for generating off-and non-farm employment should be integrated into one initiative like China’s Town and Village Enterprise [TVE] Programme, and a Rural Non-Farm Initiative should be launched particularly for families without land or other productive assets. The need is for a counterpart to the National Rural Employment Guarantee Programme [NREGP] in the skilled employment sector. The initiatives like SFAC, Agri-clinics and Agri-business Centres, Food Parks etc could be strengthened and made more effective. The Rural Non-Farm Livelihood Initiative [RNFLI] could have as its core the KVIC and the restructured and strengthened SFAC and bring all rural non-farm employment programmes together, in order to generate convergence and synergy among them. A Consortium approach may be considered for the purpose involving the Central and the State Governments, Academia, NGOs, public and private sector industry, banks and financial institutions etc. The programme may have to be market driven and at a massive scale to have impact across the country. In order to achieve desired synergy among various Ministries presently dealing with Non-Farm Employment, it may be useful to consider some reorganization and consolidation of all programmes concerning agriculture-led rural industrialization preferably in a Pan Ministry of Agriculture-Ministry of Rural Development Mode.

4.3.21 The process of preparation of the Eleventh Five Year Plan has started. In the Eleventh Plan there is need for an integrated strategy of providing the services needed by farm families and for making our agriculture knowledge intensive. The strategy developed for this purpose should include providing space for self-employed farm graduates in undertaking enterprises and agri-services which will help them to earn their living. At the moment Government is running parallel services which are mostly free and therefore opportunities for earning by farm graduates are very limited. Therefore while designing the new strategy for the scientific transformation of crop and animal husbandry, fishery, agro-forestry and agri-business, there is need for integrated planning and action so that the different actors (Government, industry and farm graduates) all have
well defined spaces. There must be synergy and convergence in the different initiatives. In fact, increasingly the Government should play the role of a facilitator and withdraw from directly running agri-services particularly in those areas where successful SMEs run by rural youth have come up. Service cooperatives should play a proactive role in the REZs.

4.4.0 Generic Opportunities

Home Market

4.4.1 Nearly 94 per cent (in value terms) of our total agricultural produce is distributed and consumed domestically, and with a 1.1 billion population, we have a huge home market. NCF had recommended in its Third Report the establishment of an Indian Trade Organisation (ITO), which will safeguard the interests of farm and fisher families by providing a Livelihood Security Box to ensure fair trade. It should be emphasised that there is no level playing field between the capital, subsidy and technology driven mass production agriculture of the industrialised countries, and the ‘production by masses’ agriculture of India characterised by weak support services, heavy debt and ‘resource and technology poverty’. Reiterating that 65% of consumers in India are also producers, majority of them marginal farmers, we must jealously protect the interests of the majority producers-consumers instead the interests of traders-importers. The steps recommended by NCF for promoting an Indian Single Market need to be examined and implemented. The livelihood entitlements notwithstanding priority should be given to infrastructure development and services support for achieving sustained livelihood security. Moreover, nothing should be done which will destroy job opportunities in rural India.

Export Market

4.4.2 In relation to commodities that are exported, it will be essential to conform to WTO regulations. At present, such commodities constitute about 7 per cent of total agricultural production in the country. Quality and trade literacy programmes have to be launched across the country. Farmers’ Associations and SHGs should be helped to export on competitive terms by spreading awareness of the opportunities available for external
agricultural trade. In such cases, cost, quality and reliability of supply will determine long-term trade relationships. The agri export zones should be further strengthened and should become places where farmers will get the best possible price for their produce.

4.4.3 **Horticulture:** Registering a steady growth of about 4 per cent annually, horticulture is hoped to enhance returns to the farmers, generate rural employment, increase farm exports and expand agro-industrial base. Despite the satisfactory growth, India’s share in the world export of horticulture commodities and products is only 1 per cent. As mentioned earlier, the AEZs, most of which are structured around horticultural crops, including the fast growing floriculture industry, must convert this challenge into a great opportunity. Organic horticulture holds great promise for pushing up exports and farmers’ income. The highly diverse agro-ecological settings in the country, matched with equally diverse and rich germplasm and aromatic plants offer unlimited opportunities for niche production, such as seabuckthorn in Ladakh (leh berry), value addition and distribution (domestic and export) of veritable horticulture species, providing new opportunities for youth employment. Several of the KVKs should be designated and restructured as *Udyan aur Udyog Vigyan Kendras* to generate desired human resources and technology transfer, emphasising backward-forward linkages. In the context of very many technologies developed for a diverse range of horticulture crops, it is essential to focus on a few priority technologies and species whilst addressing establishment of primary processing centres. Establishing primary processing centres at the selected rural centres of select fruit and vegetable crops for production in sizeable quantity would serve to protect the crop from perishability and reduction in bulk, and will promote easy transportation, storage and trade including value addition, and finally greater return to the farmer. Post-harvest losses in horticultural crops are estimated at Rs. 50,000 crore annually – a huge loss. The NHM thus must concentrate on prevention of post-harvest losses, processing and value addition, and quality, biosafety and trade literacy must be actively promoted throughout the production-distribution-consumption chain. The scope of employment generation for farm graduates and other Graduates is high mainly in the upstream areas, namely, basic processing, minimal processing and extended storage and processing.
4.4.4 **Medicinal and Aromatic Plants:** Medicinal and aromatic plants provide a window of opportunity to farm graduates and other youth to be employed in concurrent strengthening of health, food, nutrition, and livelihood security of farm families. India, as one of the biodiversity rich countries with a rich heritage of traditional medicine, whose demand in developed countries is expanding exponentially, has the potential to be a leading player in this sector. But the resources are not being judiciously harnessed. Global market of MAPs is estimated at about US$ 100 billion. India’s share in this market is hardly 3 per cent. China’s annual export of MAPs is valued at nearly US$ 50 billion. In order to harness this huge potential, investment must be made to ensure safety and efficacy of products, standardization of products and suitable regulation, proper pricing for harvested and cultivated produce, and to promote a market oriented cultivation for the home and external markets. Documenting and recognition of traditional knowledge on medicinal plants, and setting up a single window information portal are the areas needing immediate attention. In addition to the AEZ on MAP, community-based herbal gardens and enterprises and **Herbal Biovalleys** on the model of the Silicon Valley may be nurtured for providing the infrastructure needed for the conservation and sustainable use and export of medicinal plants. Organic and Contract Farming are particularly suitable for MAPs, especially in hill States, and deserve necessary technological institutional and marketing support.

4.4.5 **Biological Software for Sustainable Agriculture - Biopesticides:** Biopesticides industry is yet another highly underutilized employment opportunity for educated youth. About 700 products of different microbials are currently available worldwide. In India the utilization of microbials in pest management is in a take off stage with the commercial registration and availability of at least 16 bacterial preparations, 38 fungal formulations and about 45 insect viruses’ formulations. A study carried out by the National Centre for Integrated Pest Management in 2004 has shown a wide gap between the demand and supply position of these microbials. The entire chain from production, marketing, quality control to utilization needs to be established and vitalized to ensure that the farmers have an easy, timely and cost-effective access to quality biopesticides. At present, biopesticides represent approximately 4.5 % of the world insecticide sales. The
growth rate of biopesticides over the next ten years has been forecast at 10-15% per annum in contrast to 2% for the chemical pesticides. The targeted growth rate can be achieved only if the serious constraints in the widespread adoption of biopesticides are overcome. Biopesticide registration procedure must be simplified. Trained personnel and well-equipped laboratory should comprise a network of accredited Referral Laboratories. Unemployed agricultural graduates can be trained in production, marketing and use of biopesticides and empowered to establish and operate Bioclinics, where biopesticides as well as biofertilizers could be produced and marketed. NABARD and other nationalized banks should support this initiative to establish viable small-scale cottage industries in rural area sector with technical support and provision of nucleus cultures of effective strains from SAUs and ICAR Institutes. Krishi Vigyan Kendras can function as hubs to network the rural producers in each district. Biopesticides have a crucial role to play also in organic cultivation. Due to the very nature of biopesticides, being live products, there are risks at different links of the production-utilisation chain, which should be covered through suitable insurance provisions. All the entrepreneurs/agricultural graduates engaged in biopesticide production should be given marketing help, sales and other tax waivers, and various target oriented incentives.

4.4.6 Biofertilizers: Biofertilizers, live formulations of agriculturally beneficial microorganisms, which on application to seed, root or soil can mobilize the availability of nutrients by their biological activity and help to improve the soil health, increase TFP, microbial life and soil stability, are other group of highly under-exploited biological software. India is one of the important producers of biofertilizers, annually producing 12,664 tonnes. Maharashtra, Karnataka, Tamil Nadu, Madhya Pradesh and Gujarat accounted for 30, 22, 21, 11 and 6 per cent of the national production, respectively. Several of the States, such as Punjab, Haryana, Himachal Pradesh, Assam, Bihar, Uttarakhand had negligible or nil production. Ironically, hill States, viz. Himachal and Uttarakhand, which have declared themselves as organic states, have zero production of biofertilizers. On the other hand, the country has enough scientific excellence, rich germplasm, and protocols for bulk productions. Realizing that TFP growth is declining as the soil carbon content is depleting fast, enhanced use of biofertilizers should be promoted to improve soil carbon, nutrient utilization efficiency, soil structure and product
quality. Integrated use of compound biofertilizers in combination with chemical fertilizers and other organic manures should be popularized as per the need of the cropping system prevalent in a given agroclimatic zone. In order to further enhance the effectiveness of biofertilizer use, there is a need to shift from carrier based inoculants to liquid inoculants as they have high cell count, longer shelf life and minimum contamination. Further, formulations should be developed which could be stored at room temperature for 1-2 years and quality of the product must be protected by opting for BIS standards and employing technically skilled personnel. All the suggestions made above for marketing, training, awareness raising, certification and institutional support for strengthening the biopesticides industry are equally applicable to the biofertilizer industry, and should be implemented.

4.4.7 Vaccines and Diagnostics: Vaccines and sero-diagnostics provide yet other exciting avenue for self or salaried employment in the fast expanding livestock industry. In order to avail this opportunity, the following aspects must be kept in mind:

- The consistent production of high quality, safe, potent and efficacious vaccines requires quality assurance procedures to ensure the uniformity and consistency of the production process;
- Vaccine quality, safety, potency and efficacy must be ensured by consistency in the production process; Control procedures selected should be those that best fit the conditions under which vaccines are produced and should comply with good manufacturing practices; and
- Worldwide harmonization of standards for veterinary biologicals will be of help to chief veterinary officers who must follow the instructions given in the OIE International Animal Health Code, as they apply to all biological products for use in international trade; worldwide harmonization of registration rules should be ensured to simplify and facilitate international marketing of the products.

4.4.8 Fisheries: The fish industry is also expanding fast and may prove economically rewarding to young fishers. As recommended in the NCF’s Second Report,
the National Fisheries Development Board (NFDB) will be a professional body and function on the lines of the National Dairy Development Board (NDDB) for assisting fisher families to enhance the productivity, profitability and sustainability of both inland and marine fisheries. The Board is supposed to give highest priority to infrastructure for post harvest handling, quality, processing and promotion of sanitary and phytosanitary measures towards increasing hygienic production and trade of fish. In particular, in order to enhance the market value of Indian fishes, production and marketing of special organic fish products and air-breathing fishes as health food should be given high priority. Recognising that fish production has been growing at relatively high rate of 4-5% per year, the strengthening of processing, value addition and export of fish and fish products will provide new employment opportunities particularly in coastal zones. However, with the rapid growth of aquaculture, this trend will be equally visible in inland fish production throughout the country. For instance, the large water-logged areas in Haryana could be most profitably utilized for scientific fish production, offering not only judicious use of unexplored resources but also significantly adding to the States’ income as well as to the income of the fish farmers and other associated persons in the industry.

4.5.0 New Technologies

4.5.1 Access to market and innovative technologies will not only be intellectually stimulating but also a major motivating force for the young graduates to harness new technologies. The rural women and men must be self-employed with new skills and powers, such as biotechnology, information and communication technology, space technology and renewable energy technology. On the lines of ICT revolution in which India is the main outsourcing country in the world, the developments in the cutting-edge agricultural technologies could similarly be used by the huge trained manpower in India to provide need-based products, such as high quality hybrid seeds, *vitro* plants, vaccines, diagnostics, biofertilisers, biopesticides, etc. Necessary infrastructure and technology transfer mechanisms to establish integrated production-processing-marketing system will be essential for harnessing these opportunities. In every village at least one woman and one man should be trained to be Farm Science Manager so that army of grassroot enlightened and committed people could launch an eco-technology revolution – marrying
traditional wisdom and frontier science and technology, leading to an evergreen revolution.

**Information and Communication Technology (ICT) - Gyan Chaupals**

4.5.2 Ecologically sound and economically rewarding agriculture is knowledge intensive. Fortunately, based on the recommendations of the NCF, as contained in its First Report, the Government has already taken steps to establish knowledge connectivity through the e-governance and to develop **Every Village a Knowledge Centre**. For this, the Government is committed to provide a slew of measures so that rural user can access information of value and transact business. This will include connecting block headquarters with fibre optic network, using wireless technology to achieve last mile connectivity and operating information kiosks through a partnership of citizens, Panchayats, civil society organizations, the private sector and Government.

4.5.3 Effective implementation of the Every Village Knowledge Centre Movement and management of *Gyan Chaupals* will empower rural men and women by promoting and enhancing literacy and awareness at grassroots level especially on new and appropriate farming systems and season specific technologies, prices and marketing of inputs and agricultural produce and products and on disaster management and mitigation. New ICT technologies, such as e-agriculture, whereby agricultural information can be presented in multimedia formats to improve knowledge sharing in local cultural context, should be promoted.

4.5.4 Moreover, ICT systems must strengthen research-extension-education-farmer-market linkages through public private partnerships including the synergies with KVKs (KVUKs), ATMs, SHGs, SFEs etc. With a greater emphasis on facilitating transparent and timely adoption of various regulatory standards and guidelines to enhance access to quality inputs and markets, the public sector extension and ICT system should play a leading role in the **Agricultural Renewal Movement**. The NCF recommendations on Community Radio for enhancing the access to the unreached and to harness “air waves or frequencies which are not private properties”- a sort of revolutionary development in the ICT sector, shall certainly attract farm graduates to these connectivities which will
instantly link them with the world and directly enhance their competitiveness in the domestic and international markets.

**Biotechnology**

4.5.5 Biotechnology is a revolutionary and high pace technology with unprecedented opportunity. But, its progress in India has not been satisfactory. So far the country grows only one commercial biotech crop product, namely, Bt. Hybrid Cotton, that too the technology was imported from a foreign multinational. Moreover, a part of the Bt Hybrid Variety seed distributed by some companies to the cotton farmers is “illegal.” However, when quality authentic seed was used, the technology has certainly demonstrated its impact in significantly enhancing yield and fiber quality and in reducing environmental pollution and crop maturity duration, even though the seed was highly priced and the bio-safety measures adopted by the farmers have often been unsatisfactory. Bt. Detection Kits are available and should be used judiciously and transparently to confirm truthfulness of the seed and to build up quality control and faith of the farmers in the technology.

4.5.6 The biotech revolution is primarily propelled by the private sector. As per our needs, prospects and capacity, India should adopt an appropriate policy on biotechnology which must map out ways to benefit all stakeholders, especially small farmers, and minimize potential negative effects. The potential of biotechnology should be approached with a balanced perspective by integrating it with national development priorities, private sector interests, market possibilities, potential for adoption by farmers, public perceptions of safety, and consumers' views. An autonomous **National Biotechnology Regulatory Authority**, on the lines recommended by the Swaminathan Committee in 2004, should be established. The National Commission on Farmers, based on consultations with farmers and farmers’ organisations, September 2005, suggested that the **National Policy on Biotechnology** must address the following issues: (i) value, usefulness and appropriateness of biotechnologies, (ii) risk and biosafety aspects and their management, (iii) equity and ethical dimensions, overall awareness and promotion of pro-poor features of biotechnologies, gene literacy, (iv) control of and access to
biotechnologies, the role of public and private sectors, harmonization of various regulatory provisions, and (v) investment in research and other institutional supports and partnerships for transparent and balanced harnessing of biotechnologies. It had emphasised that **Pro-poor features of biotechnology should be judiciously harnessed to attack directly the issues of food insecurity, malnutrition, and poverty.** These recommendations and the draft Policy should be firmed up and announced without any further delay. The safe and responsible use of the tools of genomics and genetic engineering will help to launch the country on the path of an ever-green revolution. The organic agricultural movement has also accepted Marker Assisted Selection as an important research tool.

**Renewable Energy: Fuel Security**

4.5.7 The spiralling high prices of petroleum and other fossil fuels have severely stressed the country’s economy. Development and judicious use of renewable energy should thus be an extremely high priority for the nation. India’s need for energy is projected to triple over the next 20 years. Energy that is now a severe drain on the growth of the local economy can be converted into an engine for economic growth by an alternative approach. Farmers and rural people have extremely poor access to regular energy supplies, which has been adversely effecting both agricultural production and on-farm agro-processing. Renewable energy technologies relevant for application in rural areas are Biogas Plants, Solar Photovoltaic Technology, Biomass Gasification, Mini Hydro Power and Biofuel Technologies. In particular, If the country makes a strong commitment to the development of bio-mass power and bio-fuels, it can act as a powerful stimulus to rural job creation and prosperity, while radically reducing India’s dependence on imported fuels. Farm graduates can lead the national bio-energy drive and help transform their own fate as well as the agrarian and overall energy economy of the country.

4.5.8 India also has the capacity to generate bio-fuels in massive quantities based on Curcas (*Jatropha curcas*). The cost of production is competitive with other fuel oils. Cultivation of 10 million hectares of this crop, often utilizing wasteland, could produce 12 million tons of bio-fuel annually, while generating year-round employment for 7.5 to
10 million people. Only proven genetically superior high oil-yielding clones should, however, be commercially popularized, otherwise the outcome will be unsatisfactory as already seen in some of the States.

4.5.9 Ethanol, which can be produced from maize, tapioca, sugarcane, sugar beet, sweet sorghum and other crops, is another bio-fuel with enormous potential. It can be mixed as a pollution-free blend with petrol and diesel. Ethanol-petrol fuel blends are utilized in more than 20 countries including Brazil, Canada, Sweden and USA. USA consumes 4 billion litres of ethanol as motor fuel per annum. Brazil consumes more than 16 billion litres of ethanol annually and meets 41% of demand for transport fuel from this source. Between 1979 and 1992, an ethanol fuel strategy enabled Brazil to reduce reliance on imported oil by 70 per cent.

4.5.10 India presently consumes approximately 40 million tons of diesel fuel and 6 million tons of petrol per annum. Assuming a 10% blend of ethanol with petrol and diesel, the total requirement of ethanol would be 4.6 million tons per annum. With engine adjustments, much higher ethanol blends can be utilized, creating a potential demand for more than 10 million tons of ethanol per annum. India’s sugar economy has been fluctuating between surpluses and deficits. The strategy for sugarcane production for sugar and ethanol production should be worked out on economic considerations keeping in mind income of the farmers and consumers’ need and economic access to sugar. Sugarbeet (tropical varieties) and sweet sorghum may offer better alternatives, which should be examined scientifically and economically and a national programme of biofuels should be developed. Likewise, maize holds promise for ethanol production in Punjab. A systems’ approach is necessary for ensuring synergies among the various components of national biodiesel programme to delineate farming areas of crops used in ethanol and other biofuels. ICAR, CSIR and SAUs should jointly undertake to work on developing suitable processes for the purpose.

4.5.11 As suggested by NCF, the Planning Commission is proposing to establish an Integrated Rural Energy Programme (IREP) in the Eleventh Plan. An outlay of Rs. 1.2 crore per year per district would be provided for the implementation of the Programme,
total outlay being of the order of Rs. 4000 crore. The funds are proposed to be mobilized from the State Plans, as well as from NABARD, RBI and the communities and their beneficiaries. A major human resource development component would be included in the programme benefiting all stakeholders – from farmers upward. It is projected that as a result all India’s villages will be energized during the next ten years.

**Space Technology - GIS and Precision Farming**

4.5.12 Space technologies, particularly Remote Sensing (RS), Geographical Information System (GIS), Global Position System (GPS), etc. are being used for forest cover monitoring, biodiversity mapping, regulating pollution, land and water resources management, pest forecasting, developing decision-support systems and disaster management. These developments will go a long way in estimating gaps between current production and agroecological potential by systems’ modeling and in generating and transferring technologies to promote precision agriculture, leading to efficient use of resources and inputs for attaining sustainability and enhanced productivity. Monitoring of the Himalayan eco-system will greatly help in monitoring climate change and its management. But, are these technologies being adequately used in the country?

4.5.13 Using the various technologies and tools, emphasis should be placed on precision agriculture leading to the development of agricultural management system that takes care of within-field site-specific variability. It is the only viable alternative to optimize input and maximize output – a necessity for increasing India’s agricultural competitiveness in the globalised and liberalized world. Adequate financial and human resources should be provided to develop necessary hardware and software. These should be made available to each KVK and ATMA center. The Farm graduates and other educated youth should find these developments particularly stimulatory to attract them to science-led precision farming. Synergistic interventions of scientists, field functionaries and farmers are called for. A National Institute for Space Applications and Precision Farming should be set-up jointly by ISRO and ICAR to provide the necessary technological leadership to assist the States and decentralized institutions in different...
agro-ecological zones of the country to apply the new techniques towards precision agriculture and resource conservation and use.

### 4.6.0 Opportunities in Major Agro Ecological Zones

#### Hill Areas

4.6.1 Mountain and Hill ecosystems cover nearly 50% of the total national geographic area and occur in almost all the agro-ecological zones of the country. The Himalayas, extending 2,500 km in length and 250 to 400 km in breadth, the tallest water tower of our planet, occupy about 80% of the mountain and hill area of the country. This ecosystem is the richest repository of biological and agrobiological diversity, and the snow and glacier fields act as reservoirs for terrestrial and aquatic species and snow micro-organisms. Pashmina goats, yak, aromatic rices, landraces of sorghum, veritable fruits and vegetables, multicob maize, saffron, orchids, bamboos, cold water fishes and the like constitute unique germplasm treasures of the hills and mountains. Several rare genes have been used from Himalayas and Western and Eastern Ghats for enriching our major crop species.

4.6.2 **Organic Farming:** Some of the hill States have declared themselves as organic States. The world trade in organic agricultural products is currently of the tune of about US$ 40 billion and has been growing at an annual rate of 15% in the recent years. India’s share in the global trade is, however, only 0.3%, but has the potential to be raised to 20%. Several national and international enterprises, business houses and investors are attracted to organic farming, besides individual organic farmers and organic farmers’ associations. Organic farming is ideally suited to hill agriculture, especially for MAP and horticultural species and to jhuming. Around 50 tonnes of different varieties of organic spices were produced annually under the auspices of the Spices Board which has formulated well-developed protocols for organic production of spice crops, their certification system and market links. To begin with, the hill States should concentrate on production of organic spices (ginger, turmeric, black pepper, large cardamom) and different medicinal and aromatic plants. Assuming that a market growth of organic spices in Europe, US and Japan is approximately 10% per annum, export of organic spices will
get a significant production boost in the coming years. Same is the case of organic tea, where international demand is very high and smallholders’ organic tea gardens promise high socio-economic returns. About 25,000 model Organic Villages or contract farms of the strategic commodities should be developed in the hills during the next five years, and local farm graduates and other youth should be assisted to lead this movement.

4.6.3 Although the GOI has already taken steps to have indigenous certification system to help small and marginal growers and to issue valid organic certificates through certifying agencies accredited by APEDA / Coffee Board / Tea Board / Spices Board, the situation is far from satisfactory. A focused national movement on organic agriculture with a credible certification of the process and produce, coupled with quality and trade awareness and literacy is a sine qua non for mainstreaming and integrating organic farming in the national agricultural economy. In many countries, certification is covered by legislation, and commercial use of the word organic, outside of the certification framework, is illegal. It must be emphasized that establishing and running credible organic farming systems is much more complex and demanding than the usual inorganic-based agriculture. But, it is do-able and should be done for harnessing the unique opportunities in India and abroad. The National Programme for Organic Production (NPOP) has already developed internationally agreed standards for products and labelling. The Hill States should not only be linked with the NPOP, but should be given priority because of the obvious comparative advantages.

4.6.4 Debate on institutional back up support for organic farming to succeed in the hills or in other agro-eco systems should be widened and intensified. R&D institutions are still very weak and States will need to work out policies providing enabling environment for promoting organic farming. Also, organic agriculture research and technology generation is changing the whole concept of innovators. The International Federation of Organic Agriculture Movement (IFOAM) has defined organic agriculture as “all agricultural systems that promote the environmentally, socially and economically sound production of food and fibres”. It does not permit use of any chemical agents or transgenic crops in the schedule of organic farming. Therefore, much of the Green Revolution technology protocols, methodologies and perspective, which are
based on seed-agrochemicals-irrigation synergy, are of little relevance to organic agriculture. However, the concept of Evergreen Revolution, which necessarily involves pathways which do not adversely affect soil health, water quality, biodiversity, atmosphere and renewable energy sources, is compatible with organic farming concept where the emphasis is on precaution and responsibility and not on risk assessment and management (Kesavan and Swaminathan, Current Science, July 2006). Since organic agriculture is about following ecological principles in farming and its technological options are sensitive to ecological conditions of a farm, a farmer –scientist partnership is a must to undertake on-farm technology development and refinement.

4.6.5 For farm graduates, the following opportunities in organic farming exist:

• Organic farming – a value addition *viz.* Tarai Organic Farmers Amity is exporting organic Basmati Rice and is pursuing organic essential oils agribusiness
• Organic Enterprises
• Consultancy Services
• Supply chains management
• Trading linkages, both in the home and external markets
• NGOs – service provider
• Jobs with organic agencies/Consultancy services
• Own agribusiness/retail stores/trade.

Organic farming requires greater scientific inputs than chemical farming. This area of research hence needs high-level multidisciplinary attention. Internationally recognized food safety analysis and certification procedures are also needed at affordable cost. Further, organic farming zones could be created particularly in medicinal plants, fruits and vegetables, spices, tea, aromatic high quality rice, cotton and other crops which are likely to be in demand in national and international markets.

4.6.6 In order to realise the self-employment and entrepreneurship opportunities in organic farming, adequate training and retraining opportunities for graduates should be established. Courses on organic agriculture and agribusiness both for degrees and
diplomas should be included in academic programmes of the State Agricultural Universities and other Universities/institutions. Most importantly, appropriate policy and financial support for investment in organic farming would be essential for encouraging the young graduates to take to organic farming. The Graduates could particularly be helped in preparing and using Organic Farming Tool Kits based on IFOAM principles, which will prove extremely helpful in inspiring international confidence in the quality of organic processed foods and other products from India.

4.6.7 Mini Hydro Energy: The mountain topography and the water richness manifested through various waterfalls and fast flowing streams and riverlets provide unique opportunities for harnessing this renewable, low cost and clean source of electricity. A small plant of about 10 KW, costing between Rs. 10 lakh and 15 lakh could be most appropriate for electrification of an average size village. Recently, some leading private sector agencies have shown interest in harnessing the water energy by developing hydro energy plants. The mini or micro units could be linked with the macro units constituting a power grid. As energy is often a limiting factor for establishing and operating energy-based rural and agro based industries, local availability of assured and cost effective energy will greatly contribute to rural industrialization and create large number of jobs. The Central Government as well as State Governments and beneficiaries should provide necessary financial and services inputs for the establishment and operation of micro hydro energy networks.

4.6.8 Mega-Biodiversity Areas: The rich natural resource endowments of the hills and mountains include the bulk of the country’s forest resources/reserves, timber and non-timber forest products, besides possessing rich reservoirs of medicinal and aromatic plants and tremendous opportunities for various kinds of tourism, including agro-ecotourism. Due to the high pace of deforestation and other development pressures, the biological treasures of hill and mountains are eroding fast. Several of the species have entered the Red Data Book. These must be saved on highest priority through an integrated germplasm conservation approach. All concerned institutions and universities and college students in the region should be mobilized for the purpose, in collaboration with local communities. Necessary training, logistic support and conservation facilities,
including in situ conservation, should be provided. Although commercialization of forest products can help mountain communities achieve sustainable livelihoods, sustainable use of these bio resources should be ensured through appropriate institutional support and awareness raising. Panchayati Raj Institutions should be suitably strengthened to mobilize local communities to lead the conservation and utilization. Gene sanctuaries for selected species, using IK, TK and scientific knowledge, should be established and judiciously managed in a participatory mode. The local communities should be a partner in the conservation process and duly compensated as per the PPVFR Act. New crops from the Himalayan wild biodiversity constitute the greatest strength of the medicinal plants farming sector, and their end-to-end development should be institutionalised. Biovalleys should be organised in the Himalayas and in Western and Eastern Ghats to enable the local population to convert biodiversity into bio-wealth.

4.6.9 **Biovalleys:** The Silicon Valley of USA is well-known for the heavy concentration of the forward-edge companies in digital technology. What USA has done in Information Technology through the Silicon Valley, we should do in Biotechnology through Biovalleys. Biovalleys are areas rich in biodiversity and where the necessary infrastructure and venture capital funds will be provided for assisting young entrepreneurs and Women Self Help Groups to initiate enterprises designed to convert biodiversity into bio-wealth in an environmentally sustainable manner. Enterprises in the Biovalley will include the production of herbal products, health foods, biopesticides, veterinary pharmaceuticals, etc. The enterprises chosen should have market linkages. The following Biovalleys may be organized during the 11th Plan period:

a) **Himalayan Biovalley:** Suitable areas in Western, Central and Eastern Himalayas may be identified for this purpose.

b) **Western Ghats Biovalley:** This may cover the Konkan area, Goa, Karnataka (Malnod area) and Kerala (Silent Valley – Wayanad area)

c) **Eastern Ghats Biovalley:** This may cover Orissa, Andhra Pradesh and Tamil Nadu.
Enterprises in Biovalleys may be organized by **Biovalley Cooperatives or Companies**. Government should provide the infrastructure under Bharat Nirman. The private sector through CII, FICCI, etc. should extend marketing support to the Biovalley enterprises.

4.6.10 **Horticulture**: Horticulture is a very high priority in the mountain and hill ecosystem. Fruits like apple, pear, plums, peaches, oranges, cherry; new emerging fruits like passion and kiwi fruits in some States; and speciality species like seabuckthorn in cold arid zone, cardamom in Sikkim, organic tea in SFEs of Assam, ginger and turmeric in Meghalaya and Mizoram offer unique employment and economic opportunities. In some States, however, there is high concentration of one or two fruit crops, which may not be advisable in the long run. For instance, in the post WTO regime, import of apple from China, Australia and New Zealand is competing out the Himachal apple – the backbone of the State’s agrarian economy. The very special niches for other lesser known but native/indigenous horticulture crops, if promoted, will provide exclusive comparative advantage over markets and ecological suitability. Based on market research and agro-ecological mapping and matching, through inter-State consultations, commercial production and distribution of selected priority species should be systematically undertaken by commodity-specific SHGs or SFEs or through contract farming. High value crops like saffron and *Kala Zeera*, with due R & D support, can prove much more remunerative. Considering profitability, low perishability and ecological compatibility, greater attention should be paid to the production and marketing of fruit nuts *viz.* walnut, pecan and hazelnut. Anthuriums and orchids, through group farming and marketing, could become major commercial enterprises in the Himalayas.

4.6.11 The Land Use Boards, NHM and NHB and the concerned States should play a proactive role in delineation of production regimes and promotion of marketing to create win-win situation for all the partners. The Agriculture and Horticulture Universities and Colleges and other concerned institutes in the hills should design course curricula to internalize the local realities and possibilities. Their vocational and agribusiness courses and programmes should have commodity-specific hands on training programmes to
enable their Graduates and other trained youth to take to entrepreneurial activities around the speciality commodity.

4.6.12 Creation of clientele clusters with integration of production-processing-marketing will be helpful in generating meaningful employment and retaining the hill youth in their villages linked with their lands and families rather than migrating to cities in large numbers. It is proposed to train 300,000 farmers and 500 trainers at various levels in specialized areas to promote production, processing and marketing of the priority species. Farm graduates could particularly be engaged in establishing and maintaining quality mother plant nurseries both for root stocks and desired scion materials. State Plans for flow of quality planting materials of apples and other priority crops should be number one priority of Himachal Pradesh and Uttaranchal. The National Horticulture Mission should, in close consultation with the stakeholders, allocate desired financial and technical supports to this most critical area. In a public-private partnership mode, Seed Villages, Horticulture and Plantation Crop Rural Nurseries, Seed and Planting Material Self Help Groups, especially Women Self Help Groups, should be organized and supported. At least 30,000 such units should be established. Their stocks should be inventorised and the list made available for general use. Incentives should be provided to the nursery growers at least in the early stages. Individual institutions, Universities - public or private, and Government Departments should be responsible and duly empowered to timely supply breeder and mother planting materials and foundation seeds. Each State should develop annual plan for timely, quality, adequate and rationally priced production and distribution of seeds and other planting materials and should have a credible system of monitoring and correcting the unhindered flow of quality seed from the breeder/originator to the farmer.

4.6.13 Ecotourism: The landscape, water bodies, waterfalls, lakes, snow covered hills and unique flora and fauna should be harnessed to promote eco-tourism. Some of the unique livestock resources such as yak and local horses are of great tourist attraction and utility. Flower and fruit farms and arboretums conserving local wild flora are other tourist attractions. Necessary infrastructure facilities and logistics should be in place for
harnessing the opportunity. But, all care should be taken to avoid any damage to the environment.

4.6.14 **Farm Tourism:** Farm tourism can be promoted by farmers for generating additional income. This will on the one hand help address the lacuna of people in urban areas and especially the urban children not getting an opportunity of knowing what farming and farm life is all about – **Holidays on the Farm** could become a national movement. On the other hand, it will generate more employment on the farm and youth engaged in farming will gain pride in talking about their profession. Farm Tourism Hostels may be put up in suitable farms. There are a few farmers in our country who are already practicing and popularizing farm tourism (for example see www.sagunabaug.com). We need many more such initiatives across the country.

4.6.15 **Agroforestry:** In the North Eastern Region, agroforestry is a major source of livelihood and employment security. The indigenous tribes like Lepcha and Limbu used to collect large cardamom from natural forests, which were later on domesticated. Among three dozen shade tree species in large plantation areas, alder (*Alnus nepalensis*) is most abundant and preferred tree, which is a non-leguminous nitrogen fixing tree. Besides large cardamom, many food crops like maize, millet, potato, barley, chillies and colocasia are grown with alder. If a village with 100 families could set aside about 120 ha of land to grow alder trees, all families would be able to get sufficient fuelwood every year and at the same time raise crops under the alder in about 30 ha area every year. Cultivation of coffee, ginger, cardamom, turmeric and medicinal plants under the shade of naturally growing trees in Meghalaya is one of the best examples of successful combination of trees with annual crops. Many trees are lopped for their green fodder which is rich in crude protein and calcium, thus integrating the livestock sector. These are mostly grown on terraces which are widely spaced, thus causing least yield reduction of inter-crops. Different trees provide fodder at different times of the year sustaining the supply of fodder throughout the year. Department of Agriculture in Mizoram has developed its own contour trench-farming for jhum areas on hills where top portion is of undisturbed forest, middle portion is with horticultural crops and down the hill, terraced rice is cultivated with pineapple and grasses on contours, thus providing diverse options.
Many species of bamboo, palms and rattans are cultivated widely in north-eastern areas as mixed or boundary plantations. Pasture in forests is also a common practice. Sericulture based system must be a highly relevant and attractive system to the youth. Mulberry with frenchbean-groundnut followed by mustard is a profitable cropping system. With mulberry, guava/lemon/pear and pineapple in paired rows and grasses on the bunds is an ideal system for silk production and additional income from fruits and cattle rearing. Pedi-cum-sericulture is said to be more viable as the cash returns are more frequent. Agroforestry is an extremely important component of biomass generation and income gain throughout the country. A leguminous MPT, *Accacia nilotica*, is an excellent agroforestry species and should be promoted for soil protection and enrichment, charcoal making, fodder and wood.

4.6.16 In the North Western Himalayas, 60 to 70% requirement of the firewood is met from the arboreal components and several MPTs along the bunds of agricultural lands or scattered trees on the pasture lands are common agroforestry system. High rate of net primary productivity has been reported in agri-hortisilvicultural systems or agri-horticultural systems and the species number in these systems is as high as 15 tree species. Hedge-row intercropping is feasible and important on sloping hilly lands when prunned biomass during cropping season can be used for fodder and fuelwood. Kinnow based horti-silvi-agricultural system at Dhaulakuan is a model programme. To accommodate the demand for wood for packing of horticultural produce in the region, a horti-silvi-pastoral system has also been developed growing trees of Santa Rosa plum and field boundary were utilized for growing *Populus deltoids* with excellent economic returns. The strategy to develop Agroforestry systems in Western Himalayas should be based on the economy of fruits supplemented with cattle, keeping in view the soil conservation aspect. Therefore, fruit trees must be grown with forages, food crops, vegetables and MPTs on small watershed basis. The timber woodlots for supporting cottage industries may help to improve the socio-economic status of rural people. The establishment of Y.S. Parmar University of Horticulture and Forestry, Solan, Himachal Pradesh, is a laudable development to meet the training and research demands of the
State. However, the Business and Post-Harvest components of the University programme need to be strengthened. This experience should be replicated by other States.

**Arid Zone: Convert Arid Land into Oasis**

4.6.17 **Horticulture:** In Arid Zone also, Horticulture is the most important sector, along with Livestock to provide diverse employment and economic opportunities. Fruits like aonla, custard apple, pomegranate and citrus (kinnow, sweet orange), medicinal plants like isabgol and seed spices like cumin are the income leaders and export items from Rajasthan and Gujarat. The cold arid region is suitable for quality production of temperate and rare fruits such as seabuckthorn, exotic vegetables and vegetable seeds. Apricot is a commercial crop in Ladakh and sold as dried apricot. Kargil area is well known for dried apricot. Top working of seedling trees of apricot with improved cultivars amenable for drying has been standardized, thus helping in upgrading the quality of the produce and income from the existing orchards. Post-harvest technologies for drying through osmotic dehydration have also been developed. The youth should be trained and provided assistance for establishing small dehydration units which will provide additional employment as well as increase income of the growers - returns from osmotically dried apricot is about five times of that from traditionally dried fruit.

4.6.18 Farm graduates in cold arid areas have excellent opportunities for employment and income from vegetable and vegetable seed growing under **low cost polyhouses. The ‘trench technology’** has also revolutionized off-season cultivation of vegetables and strawberry. Among spice crops, identification of high yielding genotypes of *Kala Zeera* and standardization of agro-techniques including propagation have helped its commercialization. Similarly, R&D efforts in standardising both production and post harvest technology in saffron have already started paying dividends by enhancing production and quality of saffron in J&K. Hand holding by SFAC and NABARD will go a long way in promoting gainful self-employment of graduates in production and marketing of the high value low volume commodities in J&K and help in bringing prosperity and peace in the valley. The AEZs in Rajasthan for seed spices are yet other employment channel.
Livestock: Livestock is the main source of livelihood in semi-arid zone. For instance, it provides income support to two-third of the population in arid Rajasthan and is the mainstay of desert people. Most importantly, ownership of livestock in arid agro-ecosystem is positively egalitarian. Livestock-based agro industries, producing and marketing milk and milk products, leather goods and other by-products, are main source of off-farm and non-farm employment. Drought-hardy breeds of cattle, sheep and goats are required to be integrated in farming systems of the region, looking into the aspects of breeding, feeding and management of livestock. Farming systems involving animals + grasses + crops + trees + shrubs + horticulture, may bring about perceptible change in the socio-economic status of the people. Off-farm employment and per capita income of the rural people can be considerably increased through appropriate farming systems involving livestock.

The arid region constitutes 30 percent of total sheep, contributing around 40 per cent of total wool production of the country. The sustainability of the sheep production, however, is facing challenges as the pasture and common grazing lands are shrinking everyday and there is increase in pressure on these lands. Intense effort is required to develop research based, regionally relevant, ecofriendly and economically viable sheep rearing practices, meat and wool technologies that could be adopted in different arid settings of the country with varying scale of inputs and investments. Socio-economic survey of sheep and goat breeders undertaken by ICAR’s Central Sheep and Wool Research Institute, Avikanagar, has shown that average annual real income of sheep breeders has been increasing by 8 percent per annum. This magnitude of return should entice youth, especially Animal Husbandry Graduates, to take to sheep-husbandry, handling end-to-end management.

Arid agro ecosystem, with nearly 23 million goats, accounts for about 16 per cent of the country’s goat population, against 12 per cent of the total geographic area, highlighting relatively higher concentration of goats in arid agro ecosystems. Goats in the cold arid contribute about 40 metric tonnes of Pashmina, the costliest animal fiber for garments. Goat meat has the advantage of being preferred by all the communities and the demand invariably exceeds the supply. The goat milk contributes more than 4 percent of
total milk produced in India, yet its greatly dietary value and superior milk products have not been recognised and exploited for export. The skins of Indian goats are considered to be of very high quality. **The poor man’s cow, especially in arid zones and in isolated cold hilly regions, goats offer new nutrition, income and employment opportunities.** The SAUs in Rajasthan and the adjoining Gujarat and concerned ICAR Institutes in the region should establish model training, production, processing and product utilization centers on livestock, especially sheep and goat. Their academic programmes must have production-processing-business courses both theory and practical to generate need-based humanwares.

**Semi-Arid Zone**

4.6.22 **National Rainfed Area Authority (NRAA):** Yield, productivity and income gaps are particularly large in rainfed areas. Keeping this in mind as well as recognizing that rainfed areas have much higher concentration of poverty than the irrigated areas and their potential is highly under exploited, the NCF had recommended (Second Report) the establishment of a National Authority to holistically address the challenges of rainfed areas. Fortunately, the Government has now cleared the establishment of the National Rainfed Area Authority (Box I).

4.6.23 **Preparing to Meet the Challenges of Climate Change:** Climate management could be another area where educated youth can perform a valuable role. **Climate Management Centres** may be promoted by the National Rainfed Area Authority, where young farm graduates will be engaged in preparing **computer simulation models** of different weather possibilities, particularly with reference to temperature and precipitation. Based on the simulation model, they can help in fostering anticipatory action both to mitigate the adverse impact of aberrant weather, and to take advantage of good monsoons. NRAA could promote village-level Climate Manager by giving them appropriate support.

4.6.24 The extremely low and uncertain income is the main cause of reluctance of the younger generation to enter rainfed farming. Therefore, the basic mandate of NRAA should be to help farm families to achieve income and work security by promoting
farming system approach to foster water harvesting, conservation and sustainable and equitable use of rainwater to provide income and livelihood security to rural communities through increasing sustainability and productivity of crops, livestock, forestry and fisheries. The NRAA should be a highly professional body to synergise ecology, economics and employment to meet its mandate. Management of food, feed, seed and water banks, risk management and promotion of conservation farming should be vital functions of the Authority. Increasing imports of oilseeds and pulses - the predominant rainfed crops (livelihood crops), amount to importing poverty and hunger for the rainfed people. The NRAA must develop and strive to implement rational policies on import.

Box I

National Rainfed Area Authority (NRAA)

The problems of rainfed agriculture have received the attention of the Government at the highest levels with Prime Minister announcing to the Nation in his Address on 15th August, 2005, “Large parts of our country are still dependent on rainfall and we will focus on removing the problems of farmers in dryland areas. We are considering setting up a ‘National Rainfed Area Authority’ for this purpose.”

A series of high-level meetings, including the First and Second Meetings of the Agriculture Coordination Committee (ACC), Chaired by the Hon’ble Prime Minister, had deliberated upon the structure and function of the Authority. The Cabinet has now approved the Note for setting up the Authority.

The NRAA will be an experts body to provide the much needed knowledge inputs regarding systematic upgradation and management of country’s dryland and rainfed agriculture. The Authority will be a Policy-making and monitoring body. Besides, it will bring about convergence and synergy among the numerous ongoing programmes and will advise, guide and monitor their implementation as its mandate will cover all aspects of sustainable and holistic development of rainfed areas, including appropriate farming and livelihood system approaches. It would also focus on issues pertaining to landless and marginal farmers as they constitute the large majority of inhabitants of rainfed areas. However, each participating Ministry will be responsible for implementation of its line programmes after clearance from NRAA, based on the common guidelines.

The NRAA will be a two-tier structure. The first tier is a Governing Body that will provide necessary leadership and appropriate coordination in implementation of programmes. The second tier would be the Executive Committee consisting of technical experts and representatives from stakeholder Ministries. The Agriculture Minister will be the Chairman of the Governing Board of NRAA and Minister for Rural Development its co-Chairman. Ministers in-charge of Water Resources, Environment & Forests and Member (Agriculture), Planning Commission alongwith Secretaries of Agriculture & Cooperation, DARE, Rural Development, Water Resources, Environment and Forests, Panchayati Raj, Chairman, NABARD and one farmer representative/organization (to be nominated by Ministry of Agriculture) would be the Members of the Board. The Chief Executive Officer would be the Member Secretary of the Governing Board. The NRAA would be serviced by Ministry of Agriculture.

unholy nexus of poverty, hunger and resource degradation. The NRAA should be structured somewhat like National Dairy Development Board with clear-cut functions in the areas of policy formulation, resource mobilization, employment generation,
coordination with all concerned Ministries, Centre – State linkages as well as with Bharat Nirman, NREGP, etc.

4.6.25 The main goal of NRAA should be more crop and income per drop of water. It should seek and promote effective indulgence of the youth in managing this most vital resource. Increasing supply through rainwater harvesting, recharge of the aquifer and water conservation should become mandatory. Demand management through improved irrigation practices and crop planning and care, should receive priority attention. The youth must be trained and empowered to lead this movement and should launch a water literacy campaign particularly for the sustainable use of ground water and conjunctive use of water. Seawater farming should be promoted in coastal areas. They may assist the Panchayats in launching water literacy and water quality management programmes and in promoting participatory irrigation and efficient water use management.

Irrigated Zone: Evergreen Revolution

4.6.26 The future of our agriculture and food security and even national sovereignty depends on our ability to increase productivity per units of arable land and irrigation water in perpetuity without associated ecological harm, a process known as “Evergreen Revolution”. The national agricultural research, education and extension, development, marketing, pricing and institutional system must focus on the small farmers who are most concentrated in irrigated areas, and the holding fragmentation continuing unabated, and whose toil is the engine of nation’s food security - ushering in Small Farm Revolution. Building on the gains of the Green Revolution and avoiding its pitfalls, we must move towards an Evergreen Revolution by concurrently resorting to a three-pronged strategy: (i) Protecting yield and productivity gains, (ii) Extending the gains to new areas, and (iii) Enhancing yield ceilings and achieving new productivity gains. Bridging yield gaps, minimizing post-harvest losses, augmenting value addition and improving productivity and farmers’ income; and promoting eco-technologies, including conservation farming, rooted in the principles of ecology, economics, equity and employment are the major synergistic and converging pathways towards Evergreen Revolution. Integrated crop
care encompassing integrated pest management, integrated plant nutrient management and integrated natural resource management is the way to “Green Agriculture.”

4.6.27 The farm graduates and other educated youth will be called upon to use the latest developments in biotechnology, ICT and other cutting edge technologies and synergistically link these technologies with conventional and traditional technologies and knowledge. The need for orienting training and tooling of our Graduates to get actively linked with the various steps and components in the research-education-extension-farm-market-business chain can hardly be overemphasised. They must become the service providers and mobilise the community to practice green agriculture with high pay off. The educationists, research and technology developers must ask themselves as to whether the Graduates and field workers are equipped enough to launch the Ever-green Revolution. If not, the human resource development programme must be revamped, as discussed later.

Coastal Zone and Islands

4.6.28 More agro-based industries should be developed in coastal areas to create more employment through value addition to products based on coconut, oil palm, honey, cashewnut, rubber, fruit, fish and shrimp, milk, beverage, medicines, poultry, sea food and mangrove products. Large areas under coconut plantations are neglected and remain open for grazing. Through self-employment or leasing arrangements, the youth may convert these areas under multistoreyed cropping systems. The rural youth should be trained also to take to skilled planting of mangroves. All along the coast as well as in the Andaman and Nicobar Islands and Lakshadweep Group of Islands, agro-aqua farming systems will open up great opportunities for income and employment generation on a sustainable basis, provided they are based on sound ecological principles. The tyranny of distances of islands could be somewhat economically moderated by promoting eco-tourism, conserving the genetic heritage and by establishing offshore quarantine. The youth should be sensitised to help adopt proactive measures like the erection of mangrove and non-mangrove based bioshields in order to safeguard the lives and livelihoods of island populations in the event of sea level rise due to global warming.
To provide integrated training in all aspects of capture and culture, fisheries ranging from capture/culture to consumption, Fish for All Training Centres should be established.

7.0 Young People’s Mission and Action: India A Major Agricultural Outsourcing Hub of the World

4.7.1 Ours is a “rich country inhabited by poor people.” The challenge before us is as to how to convert the rich human capital, natural recourses wealth, gene reservoirs and agro-ecological diversity into more jobs and income in perpetuity. As already experienced under the ICT revolution, the Evergreen Revolution can render India as a major agricultural outsourcing hub of the world, particularly for hybrid seeds, in vitro culture propagation material, biological softwares (biofertilisers and biopesticides), botanical medicinal and aromatic products, organic products, such as organic fruits and vegetables, organic wine and beer, eco-textiles and processed foods. Thus, today’s Agriculture must be seen also as an important source of quality employment and global outsourcing hub. Excellent opportunities exist also for global outsourcing hub in the areas of plant and animal genomics and ICT, involving large number of village people linked through the Gyan Chaupals.

4.7.2 Young graduates should be duly trained for specialized production of the various products and dynamically linked with the world information on their agri-business. Appropriate Regulatory measures, particularly Sanitary and Phytosanitary measures, Food Safety Standards, IPR, Geographical Indicators, TRIPS, etc. should effectively be in place and fully functional. Selected SAUs and ICAR Institutes may establish Centres of Outsourcing Business in Agriculture. Some of the KVKs could take lead in specializing in specific commodities in one or the other of the areas mentioned above and develop the necessary expertise and infrastructure to ensure production and supply of quality standard products as per international standards. A campaign to promote gene literacy, bio-safety literacy, IPR literacy, etc. should be undertaken to sensitize all the partners in the production-distribution chain. As mentioned under the Section, “Organic Farming”, internationally-recognised certification facilities must be provided before starting large-scale outsourcing of organic products.
4.7.3 With the above developments, Indian villages and even small farmers can be linked with the global markets and agri-business centers in USA, Japan, Europe, etc. In several of these domains, there are tremendous opportunities for farm graduates and other educated youth to be self-employed or regularly employed. For instance, in the seeds sector, the value of planted seed in the world has reached staggering proportions – an estimated US$55 billion annually. At the same time, the demands of biotechnology, communications, and intellectual property protection have created new challenges and opportunities. This underlines the necessity for creation of world-class infrastructure for competitive quality production, accessing and assessing the global market through critical agri-business analysis, thus linking science, technology, industry and market.

4.8.0 Institutional Structure

Small Farmers’ Agri-business Consortium (SFAC)

4.8.1 The Small Farmers’ Agri-business Consortium (SFAC) was started by the Prime Minister Dr. Manmohan Singh in 1992, when he was the Union Finance Minister of India, to enable small farmers to take to market-driven agribusiness. But, unfortunately, such an excellent programme never took-off though explicit budgetary provisions for the programme still exist. We need to have the situation critically assessed and render it effectively functional and professionally-managed so that the graduates and other educated young farmers could receive the guidance, training, tooling and initial hand-holding for establishing rural entrepreneurial activities to expand rural markets and direct access to market. The SFAC should work closely with selected KVICs, AEZs and Agri-business centers for their enhanced efficacy.

Agri-clinics

4.8.2 The Central Government has launched agri-clinic and agribusiness centres programmes to provide a single window access to multiple inputs, expert services and advice to farmers on cropping practices, technology dissemination, crop protection from pests and diseases, market trends and prices of various crops in the markets and also
clinic services for animal health etc. which would enhance productivity of crops and animals. Some of the programmes of the private sector, such as Haryali Bazar, also provide diesel/petrol pumps and banking facilities. However, before setting up agriclinics and agribusiness centres, interested agricultural graduates are supposed to be provided specialized trainings to inculcate in them required managerial and some technical skills for setting up and running the center/ venture. The training courses would be provided free of cost in various State Agricultural Universities and Departments and public sector institutes. Initiated by Small Farmers Agri-business Consortium (SFAC) and coordinated by National Institute of Agricultural Extension Management (MANAGE), the courses comprise entrepreneurship development, business management as well as skill improvement modules in the chosen areas of activity. There are several projects/ ventures in agriculture which can be taken up by any unemployed youth with some prior training from an appropriate institution.

4.8.3 While necessary support should be extended to farm graduates to establish and operate agri-clinics, including extension advisory activities, input dealership should primarily be given to agriculture graduates who besides ensuring timely distribution of quality inputs would also be proactively involved in rendering extension services to their clients. A single licensing system should be put in place. Those agri-clinics which do not have farm graduates on their establishment, should be obliged to hire agricultural graduates. As regards institutional support, quality credit packages and their delivery and comprehensive farm family insurance plans must be in place to strengthen the programme. **One Agricultural Supervisor (Agricultural Graduate) for every 2 Panchayats is recommended.**

**Agri-business Centres**

4.8.4 Agricultural, Veterinary, Fisheries, Rural and Women’s Universities should restructure themselves to be able to help every scholar to become an entrepreneur so that they can organize Agriclinic and Agribusiness centers. The Universities should expand their current Placement Bureaus in order to provide a special **one-stop window** for generating awareness of self-employment opportunities. Job Fairs can also be organized.
Industry representatives feel that there is considerable unmet demand in relation to the range of services needed to farm families. There is therefore considerable scope for training farm graduates to provide demand-driven services. Agricultural entrepreneurs are needed in large numbers for achieving successful farming systems diversification and value addition and for providing the right inputs at the right time and place. Mobile phones have made communication easy. Farmers will be willing to pay for value-added services.

**Harnessing Group Dynamism**

4.8.5 The National Commission on Farmers (NCF) had recently organised a National Consultation on Attracting and Retaining Youth in Farming. Over 50 participants, including Vice Chancellors of selected Agricultural Universities, heads of private companies, senior representatives of the Govt. of India and ICAR, representatives of international organisations, executives of banks and 17 agricultural graduates both employed and unemployed, had participated in the Consultation. It was heartening to note that several of the farm graduates and other Graduates have joined hands and formed Groups and are operating and managing agriclinics and agri-businesses as well as are involved in precision agriculture including greenhouse production of high value crops/commodities and vitroplants, honey, mushroom and fingerlings. These Groups are particularly helpful in ensuring the supply of quality seed and other inputs and in undertaking integrated pest management, integrated nutrient supply, scientific water management and adoption of improved post-harvest technologies. Some of them are successful in forging backward linkages with latest technology and credit and forward linkages with processing and marketing organisations.

4.8.6 Some of the farm graduates are participating in contract farming. This is particularly encouraging as with their participation the interest of other partner farmers is expected to be safeguarded. Needless to mention, contract farming based on a well-defined Code of Conduct will be helpful to small producers in getting good quality input, a fair price as well as prompt payment for their produce. **A Code of Conduct for Contract Farming** will have to be developed for major groups of farm commodities like
vegetables, fruits, flowers, medicinal plants, tuber crops, pulses, oilseeds, sugarcane, cereals, cotton etc. Both production and marketing contracts are growing. Available evidence indicates that direct contract between the producer and purchaser is more advantageous to small farmers than indirect contract through intermediary agencies.

4.8.7 A National Federation of Farmers entering into contract cultivation will be useful to identify the best pro-farmer practices that will ensure a win-win situation for both producers and purchasers. As also emerged at the State-level Consultations, many prefer a tripartite contract involving the farmer or farmer group, the procurer and the concerned Government, the latter required primarily for dispute settlement, if any. Though various models of contract farming have been tried in India, the success has been rather limited. The need is to develop comprehensive, clean, equitable and farmer-centric model agreement which could not be abused against the farmer. Special care is required regarding clauses dealing with quality standards, withdrawal conditions, pricing standards, paying arrangements, acts of God clauses and the arbitration mechanism.

4.8.8 In its earlier reports, NCF has recommended the formation of Small Holders’ Cotton, Horticulture, Herbal, Poultry and Aquaculture Estates. The aim is to promote group cooperation among farmers living in a village or watershed or the command area of an irrigation project in improving productivity, reducing the cost of production and entering into marketing contracts with textile mills, food processing industries, pharmaceutical companies, fish marketing agencies etc. Such Small Farmers’ Estates can also manufacture products under brand names and enhance income security. Group insurance will then become feasible. Agri-clinics and Agribusiness Centres run by farm graduates could be linked to such Estates. Cooperatives, particularly service cooperatives, and SHGs are other group mechanisms which could provide power and economy of scale to small farmers and the youth in their production-distribution ventures. While the reforms are overdue in the cooperative sector, the SHG could be upgraded to sustainable Livelihood Group through training and monitoring.
4.9.0 Education and Training

Education for Agriculture: The Need of the New Millennium

4.9.1 Establishment of a large number of SAUs and the resulting human resources have played an important role in strengthening and spreading the Green Revolution since the 1960s. Now new demands are being put up on the system, which it must meet in order to remain responsive and relevant. Generally, the knowledge explosion in ICT, Biotechnology, Space Technology, nanotechnology, etc. and the fast changing international environment, particularly in the globalised and liberalized world, and trends and implications of increasing divides on the income, digital, gender and social fronts have not been internalized in curricula of most SAUs and colleges and the graduates are becoming increasingly removed from global realities. Basic and strategic research is drying fast and the teachers, especially the senior ones, are not abreast of the latest developments, hence routine and mundane teaching continues. The agricultural education at SAUs and agriculture colleges must be revamped to become education for agriculture. For this, multidisciplinary teaching, adequate infusion of basic and social sciences and linkages with relevant institutions in the country across Ministries should be ensured to develop holistic and enriched education for agriculture to increase awareness on the challenges and opportunities of new and complex interrelated issues and developments.

4.9.2 Since Independence, the annual output of farm graduates has swelled 15 fold. The number of unemployed graduates has also multiplied likewise. There is a mismatch between employment and education. While the number of employment opportunities is rising more or less at the same rate, as the growth rate of the work force, the type and quality of these opportunities hardly match the expectations of many educated job-seekers. This reflects inadequacies both in the type of employment generated and the type of education being imparted to youth.

4.9.3 Reorientation of education for agriculture within a reasonable timeframe and its visible impact on employability should be launched as a mission to introduce necessary structural changes in the system so as to capture modern realities, challenges
and opportunities. Reforms to forge partnership with various stakeholders, who influence and are influenced by the quality of agricultural education, should receive high priority. Emphasis of futuristic agricultural education should be on introduction of a revised course curricula embracing new teaching and learning areas (typical examples being agribusiness and entrepreneurship, biosecurity, diversification of farming, processing and value addition, natural resources and environment management, marketing, international trade and treaties and biotechnology) and delivery systems (information and communication technology), deployment of highly qualified faculty, creation of infrastructure for extensive practical sessions and linkages with private partners to support career-building training. Genome clubs may be formed in schools to promote genetic literacy and the opportunities opened up by the new genetics for strengthening food and health security.

4.9.4 There is need for a few Centres of Excellence in Agriculture (Crop and Animal Husbandry, Fishery and Forestry) on the model of IITs and the IIMs. The Agricultural Universities Association should not only bring about curriculum reform for imparting more practical training, but also reforms in the pedagogic methodology taking into account the new opportunities opened up by ICT for promoting a learning revolution among our students. By suitably restructuring the pedagogic methodology using ICT tools, it will be possible to save time for practical work. Agricultural Universities should also organize more non-degree training programmes. All Farm Universities should adopt the motto “Every Student an Entrepreneur”. Entrepreneurship and innovation must be the key goals of Universities.

4.9.5 Adequate financial support should be made available to the SAU’s and other educational institutions which are acutely starved of funds. While the State Governments have rather liberally been establishing new agricultural and related universities, there is negligible increase in the overall financial allocation to agricultural education. It is suggested that one time substantial catch up grant should be provided to the agricultural education institutions for establishing State of the art equipment, training modules and their deliveries and other facilities. Centres of distance education should also be
strategically established. In order to avoid inbreeding, a certain percentage of faculty and
students must be recruited and admitted from outside the State.

**Revamping University curricula – Mainstreaming Business Management and
Applied Courses**

4.9.6  The Universities must adjust the formal and non-formal training programmes,
syllabi and outreach programmes, particularly of their **KVKs for employment oriented
activities related to agro-processing, value-addition and other post-harvest activities**
which are bound to create additional employment opportunities. The Universities could
promote not only entrepreneurial abilities of the graduates but also help them establish
businesses for themselves, such as agriclinics, soil and water-testing facilities, agri-
machine hiring and repair facilities, seed production and distribution, etc. **University
centres should establish employment and business advisory services** and promotion
centres not only for their own graduates but also for other youths. As seen from Box II,
convergence between science and agribusiness, University curricula and course
contents are fast evolving towards enhancement of employability of the
professionals and for the mutual benefit of the science and industry – a win-win
situation.

4.9.7  The following key issues must be addressed towards increasing employment
and retention and attraction of farm graduates in farming:

i)  Poor and deteriorating quality of graduates and deficiency of practical and
business skills for self-employment.

ii)  Poor infrastructure and facilities in rural areas, especially irregular and highly
inadequate electricity and other energy resources and the lack of desired
educational and health care facilities.

ii)  Poor communication and information connectivity; lack of technology-
market-and employment-related database.

The main reasons for the above shortcomings are:-

i)  Routine, mundane, static and stale university curricula; mismatch between the
dynamic need/demand of new skills, expertise, talent, tool and techniques and
the actual formal training imparted and technologies/approaches available or developed for the purpose.

ii) Shortage of competent and spark-creating teachers, and large number of teaching, research and extension positions lying or kept vacant.

iii) Intake quality compromised, as in several States no minimum is fixed for entrance examinations.

Box II

Master of Science in Seed Technology and Business
Iowa State University of Science and Technology
College of Agriculture, Seed Science Centre, Ames, Iowa, USA

Iowa State University – College of Agriculture and Business have teamed up to meet up to meet the needs of seed industry, professionals with four-year degrees: the new Online Master of Science Degree in Seed Technology and Business.

Programme Features:

- Science, technology and business courses with a focus on decision-making in the seed factor.
- Flexible and convenient for working professionals: content available on CD’s for flexibility.
- Student remain part of an interactive group
- Creative component replaces thesis.
- 33-month study course – 36 to 37 credits depending on scope of creative component – paced for working professionals.
- Administered by the ISU Seed Science Centre through Continuing and Distance Education.
- Quality content taught by highly regarded faculty.

The Centre also offers two graduate certificates: one in Seed Science and Technology and another in Business Management.

4.9.8 The curricula revision stems from the fact that the setting-up of responsive curriculum systems is a key step by which the target of training qualified personnel can be accomplished. New curricula may include the components like physical conditions, broad knowledge including knowledge of humanity, ideological accomplishments, practical ability, scientific theory, professional knowledge, knowledge of related disciplines, and technical skill training.
4.9.9 The education and teaching methods must be improved to do justice with the contents, as suggested below:

- Teaching methods are the ways of carrying out curricula which directly influence the effects of knowledge transformation.
- Using heuristics and discussions in teaching may be adopted in classrooms.
- Obtaining new knowledge, analyzing and solving problems through full use of various resources and a computer-aided teaching system are essential components of improving all-round abilities with a practical outlook.

4.9.10 Practical teaching links must be improved, as suggested below:

- Practical teaching links include teaching practice, scientific research, technical development, extension activities and social services.
- Practical teaching is an important link not only in examining the exact results of curriculum systems and teaching methods being used, but also in training the abilities of innovation, experience and creativity.
- The contents of experimental curriculum systems should be reformed and new teaching practice systems should be established to train operational ability according to specialty or discipline.

4.9.11 The curricula changes should duly reflect national and global visions of food and agriculture and the most appropriate farming system to enhance income, profitability and sustainability under the ever-increasing competitiveness. As the employment in the private sector is fast increasing and also keeping in mind the need for enhancing self-employment, the curricula should emphasize skill development aspects. The major employer and other main stakeholders, namely, the public sector, private sector, industry, agri-business and progressive farmers should be involved in curricula development. For hands on experience due emphasis should be placed on internship.

4.9.12 Emphasising skill development, vocational education is expected to create middle level trained human power, particularly trained persons to run agri-clinics and to serve as technology agents and to meet the varying demands of private sector and for promoting entrepreneurship. In this context, experiential learning of about 1 year integrated skill orientation following 3 year courses during the graduation programme
will be essential. For Home Science graduates, 2 years course work followed by 1 year each for courses and attachment to industry etc. is recommended. Under the WTO regime, specialized courses on export procedures, quality control, management of agri export, commodity trade, commercial agriculture and precision farming should be emphasized. New and emerging areas like value addition, marketing, biosecurity, IPR, INM, SPS, quality standards should be adequately covered.

4.9.13 Hands on experience of developing agri business management modules towards enhancing confidence and analytical skill of farm graduates is essential for promoting new enterprise ventures. In order to give the necessary boost to post harvest management, processing and value addition, adequate training facilities and hands on experiences in these areas should receive highest priority. KVKs, ATMA Centres and other such institutions should be duly strengthened for training in post-harvest management and marketing.

4.9.14 Farm graduates, empowered through need-based vocational training, should be encouraged to embrace agriculture-related and other manufacturing activities. They should be organized in groups and helped to establish clusters of small units. These clusters should be located in or near large market towns, on the peripheries of cities and along major highways or railway lines. There are nearly 6000 block headquarters as also about 7415 APMCs. Many of these as well as many existing industrial clusters present favourable location for focused development.

4.9.15 In the case of medical and veterinary sciences, there is a system of registration of practitioners. It would be useful to develop a system for according recognition to farm graduates to provide Extension and other services by recognizing them as Registered Farm Practitioners. It may be necessary to set up an All India Agricultural Council on the model of the Medical and Veterinary Councils to give such accreditation. This will also be an oversight mechanism to ensure the quality and credibility of the services provided by farm practitioners.
4.9.16 Areas like the North Eastern Region and Jammu & Kashmir requires special attention from the point of view of providing Fram Graduates with opportunities for gainful self-employment. For this purpose each State should organize a Recognition and Mentoring Programme (RAMP). In the hilly areas there is a particular need for service centre for farm machinery. A sub-cadre of agricultural graduates may be established for the NER under the ICAR’s ARS to recruit scientists from the region and for the region so that the positions could be filled effectively. Special training and tooling should be done for these graduates on a regular basis.

4.9.17 The Tenth Plan has called for paradigm shift from food security at the national level to nutritional security at the individual level. There are very large numbers of Home Science Graduates who are unemployed or in-appropriately employed. A new scheme should be formulated for organizing Nutritional Clinics on the model of Agri-clinics which will provide an opportunity for Home Science Graduates to ensure the success of ICDS and mid-day meal programme and to fight hidden hunger caused by the deficiency of micro-nutrient in the diet.

4.9.18 The facilities for practical training for farm graduates must be expanded. The Vidya Dairy at Anand which impart end-to-end training as well as the Fish For All Training Centre which is being established by MSSRF at Nagapatnam are good examples of imparting skills through learning-by- doing. This move could be extended to all important commodities like lac, sericulture, ornamental fish production, etc.

National Alliance For Self-employment of Farm graduates

4.9.19 There is need for a National Alliance for facilitating self-employment. Such an alliance can bring together all the stake-holders – Private and Public Sector Institutions, Commercial and Cooperative Banks and farm graduates Associations. Such a National Alliance can provide oversight for the implementation of a national strategy for the knowledge and skill empowerment of rural families and for imparting quality and trade literacy. They can also monitor progress in achieving the goal of every student entrepreneur in our Agricultural and Veterinary Universities.
4.9.20 We have to achieve the following revolutions, as we wish our agriculture to become economically rewarding and intellectually stimulating to attract and retain educated youth in farming:

- Productivity revolution
- Quality revolution
- Income and livelihood revolution
- Management and marketing revolution,

In the above context, we should review how our vast research, educational and extension infrastructures could be retooled and restructured to meet the challenges of today and tomorrow. The most urgent tasks today are enhancement of productivity per units of land and water and farmers’ income as well as achieving a quantum jump in quality improvement. Quality has to be judged by culinary, organo-leptic, nutritional and processing characteristics. The management and marketing thrust must confer on small producers the advantages of scale both in the production and post-harvest phases of agriculture.

4.9.21 Central and State Governments should not expand official extension departments, if opportunities for remunerative self-employment are to become available to farm graduates. We need a new deal for the self-employed in terms of public policies which promote and not obstruct socially relevant enterprises. Private sector industry can help agricultural progress, particularly in the area of perishable commodities like fruits, vegetables, flowers, fish and animal products by undertaking contract cultivation and entering into buy-back arrangements, duly covered under a Code of Conduct. In their respective catchment areas, industries could provide a wide range of services, as is already being done by the tobacco and sugarcane industries. In particular, private sector should give management and marketing support to agriclinics and agribusiness centres and set up in major production centres computer-aided market information system.

4.9.22 Groups of motivated, like-minded and skilled farm graduates, by themselves or through public sector support or through partnership with established industrial houses,
could create organized large-scale manufacturing units in rural areas. Moreover, they can proactively encourage ancillarization. The Government should support such ventures possibly by offering tax breaks to large units which sponsor the development of small units on a contractual basis. Such farm graduates, even though not directly involved in hardcore farming, their mere presence in rural areas will be a great moral-booster to their own as well as to other families, besides rendering occasional extension and advisory services to the farmers.

4.9.23 China has succeeded in providing work opportunities for its vast rural youth, through an integrated approach to on-farm and non-farm employment. China’s twin strategy comprises of: (a) improve small farm productivity and profitability and (b) withdraw surplus labour from unskilled on-farm to skilled non-farm employment through Township Village Enterprises (TVEs). We suggest that the Ministries of Agriculture and Rural Development may initiate a Pan-Government of India Programme Designed to Provide Work Opportunities for All in Rural India.

4.9.24 The vast trained manpower now being created in the areas of agricultural biotechnology and information technology, provides an uncommon opportunity for India becoming a world leader in taking up assignments on behalf of other countries – both developing and developed – in the areas of software development for agricultural ICT, hybrid seed production, tissue culture propagated plants, biological software for sustainable agriculture, genome mapping, gene mining, Indian health systems like Ayurveda, Unani and Siddha. We should ignite a spirit of imagination, pride and innovation in our youth, so that they become the torchbearers of the New Agriculture Movement.
CHAPTER 5

IMPROVING COMPETITIVENESS OF INDIAN AGRICULTURE

5.1 Introduction

5.1.1 The issues connected with competitiveness of Indian agriculture have assumed considerable importance in the light of the WTO Agreement on Agriculture. Given the limitations of a developing country and inadequate investments in infrastructure and frontier areas of science and education, Indian farmers are being exposed to international competition in an unequal playing field. However, there is also no doubt that if appropriate infrastructure combined with adequate incentives and support becomes available, Indian farmers are quite capable of producing many crops and animal and fish products efficiently and competitively. The globalization and opening of trade could therefore also offer new opportunities provided focused attention is given to improving competitiveness of Indian agriculture with a sense of urgency.

5.1.2 There has been a major change in the macro policy framework after launching of the economic reforms in 1991. The sharp devaluation of Indian Rupee [about 24 percent in June 1991] improved competitiveness of many agricultural commodities [though export subsidies were withdrawn] and resulted in a fairly rapid growth of their exports, leading to an impression that Indian agriculture would greatly benefit from economic liberalization. The annual export growth for agricultural products in value terms was most significant during 1992-97 at 16.04 percent as compared to 5.34 percent during 1986-91 and -3.08 percent during 1980-85. During 1992-97 the import value index of agricultural products also increased by 25.76 percent as compared to -13.91 percent during 1986-91. Another development was the large increase in input prices and also the Minimum Support Price [MSP]. The MSP of wheat and rice increased from a level of Rs. 225 [per qtl] and Rs. 205 [per qtl] in 1990-91 to Rs 475 and 380 respectively. The increase in MSP of wheat in six years was over 111% and in paddy over 85%. Since

---

1 Summary of major provisions under the Agreement on Agriculture [AoA] as were applicable to developing countries by 1995 – 2004 are indicated at Annexure – I.
in the beginning, the world prices of agricultural commodities were rising, it did not adversely affect their competitiveness. However, after 1996, the world prices started falling due to heavy subsidies in EU & USA which led to fall in competitiveness of Indian agricultural products and a slow down in exports.

**Competitiveness of Agricultural Products**

5.1.3 In no trade situation, comparative advantages and allocations of land within agriculture can be decided by the value of output per acre of land or per unit of input cost. The higher the ratio, the greater is the internal comparative advantage or efficiency in producing the commodity under consideration. However, as land is restricted within the borders of a country and the movement of labour, particularly the unskilled, is restrictive, the above mentioned measures of competitiveness cannot be used to achieve efficiency of allocation of resources between different countries. On the other hand, in a fully liberalized and globalised situation, unlike most factors of production, the commodities could be freely exported or imported. Therefore, the prices in other countries, transportation and marketing costs and the cost of processing influence the resource allocation. With increasing globalization, assessment of global competitiveness has become one of the tools for taking resource allocation decisions.

5.1.4 In due course, the globalization would be characterised by exploiting comparative advantages of nations and by reliable assessment of demand and supply in relation to commodities of importance in international trade and integrating them into global management of the value chain. It would mean a very strong drive for performance competitiveness among countries and between producers within a country. However, the road is long and participating in the long march is not without serious local problems and also constraints.

**Measurement of Competitiveness**

5.1.5 How is competitiveness measured? The idea of comparative advantage focuses on the cost of production of different commodities in the country vis-à-vis in the major trading countries of the world. However, the actual trade takes place on the basis of
prevailing prices rather than the costs. These prices are distorted due to market structures and business strategies. The standard system for assessing the competitive advantage is to assess the effective rate of protection provided by a country. It is also necessary to make the assessment on the basis of say, 5 to 15 years data so as avoid abrupt fluctuations in prices in some years. There are various measures of competitiveness. The Net Protection Coefficient [NPC] could be used for measuring the competitiveness of domestically produced goods with imports and also for exports. The transport costs have to be added to the export price while assessing the competitiveness for imports and exports. For import competitiveness, the agricultural produce of India at the port should be cheaper than the import price at the same port of the same quality goods and vice-versa for exports. In operational terms, for assessing the import competitiveness, the exporter to our country pays the freight, transport charges etc. while if we were to assess export competitiveness of our products, the freight, transport and handling charges to the destination will have to be added to our local cost of production. The transportation and handling costs both internal and international could make a big difference in the international competitiveness. Another method of assessment of competitiveness is the Effective Protection Coefficient [EPC]. This is a refinement of the Net Protection Coefficient as it takes into account the variation in domestic and international prices of the tradable inputs. It is the ratio of value-added at domestic prices to the value added at border prices expressed in local currency. In simple words it is the ratio between the value added commodity at domestic prices [domestic price of a commodity minus the value of all inputs required to produce a unit of that commodity] divided by value added at world reference price of all traded inputs at border price equivalent minus prices of all traded inputs at border price adjusted for transportation, handling and marketing expenses etc.

5.1.6 The most widely used and comprehensive measure of resource use efficiency is the Domestic Resource Cost [DRC] method. The DRC is the value of domestic resources [primary, non-traded factors of production] needed to earn or save a unit of foreign exchange through import substitution by production of a commodity. The value
of non-traded inputs like land, labour and capital has to be in terms of their shadow prices or opportunity cost to take-care of the market distortions.

**Competitiveness of Indian Agriculture**

5.1.7 As per on early work of Dr. A. Gulati\(^2\). India was moderately to highly competitive in rice, wheat, bananas, grapes, sapota, litchi, mango, onions, tomato, mushroom etc. in 1989-90 to 1992-93. In sorghum, apple, mango pulp and apple juice India was not competitive, while maize was a marginal case. The situation became different in the analysis based on 1990-91-1997-98 data. While rice and banana remained highly competitive, wheat, gram, mango, grapes, sapota, onion and potato were only moderately competitive and maize, sorghum, bajra, barley, arhar, groundnut, rapeseed mustard, soybean, sunflower, apple, tomato were non-competitive [NPC above 1 and ranged between 1.14 for tomato to 1.85 for barley].

5.1.8 The study of competitiveness of crops over 1990-91 and 1999-00 for selected commodities in major producing States by Prof. G.S. Bhalla\(^3\) reveals that based on the Net Protection Coefficient [NPC] calculations, India was an efficient producer of wheat, rice and maize and could effectively compete against import of these commodities. In the case of tur, gram, rapeseed and cotton India was import competitive but the same could not be said of sugarcane. During 1997-98 to 1999-2000, groundnut was also import competitive. wheat, rice, tur, gram, maize and jowar were also export competitive. However, in case of cotton, while Punjab and Karnataka were export competitive during 1995-96 to 1998-99, Andhra Pradesh, Gujarat and Maharashtra were not export competitive in 1998-99. However, due to large variations in international prices of cotton, the degree of competitiveness keeps on changing.

5.1.9 The competitiveness of most of our agricultural commodities would change very favorably of the developed countries withdraw the huge domestic support which they extend to their agriculture. However, it may also be noted that import

\(^2\) Export Competitiveness of Selected Agricultural Commodities, 1994  
\(^3\) Prof. G.S. Bhalla-State of Indian Farmer-Millennium Study-Globalization and Liberalisation of Agriculture
competitiveness of our agriculture is getting reduced due to various factors like increase in input prices and consequent hike in their MSP year after year, the deceleration of the productivity growth rates and the world trend of downward movement of prices of agricultural commodities till recently.

**Box I**

**Bright Spots and Some Concerns**

As stated earlier, India is competitive in several major agricultural commodities. However, the movements of international prices are continuously influencing India’s competitiveness. India’s traditional exports such as tea, coffee, tobacco and spices are likely to continue as significant constituents of our agri-exports. However, there are emerging exporters challenging us and eating into our export markets like Vietnam. In rice, wheat, cotton etc. we could increase our exports as also in certain fruits, vegetables and fish. However, the productivity levels could be further improved with focused attention to add to our competitiveness. Pulses and other cereals are generally import competitive. The major non-competitive commodity is oil seeds and edible oils. However, we are very short in pulses and oilseeds for our domestic consumption. Per capita consumption of pulses is very low in relation to dietary needs.

Competition from cheaper imports would be a serious concern for our farmers and the Government will have to be very vigilant.

We have to also take care that we do not move from higher value addition to lower value addition in our exports. There is need to guard that the safety standards are not abused as non-tariff barriers against our exports. Needless to say we also have to be more quality conscious and our farmers need more knowledge and training in the matter. The future lies in demand management. The idea is to first identify an international demand and then move backward to the farm. Along the way, identify short comings/weaknesses and attend/rectify those to capture the market.

5.1.10 Huge subsidies provided by the developed countries has greatly affected international prices and the competitiveness of our agriculture. Some indications of domestic subsidies provided by these countries can be seen from the following table:

**Table 1: Agriculture subsidies [PSE] and its percentage of Agriculture GDP in select countries**

Source: Agriculture Statistics At a Glance: 2005, Ministry of Agriculture, GOI
The per hectare subsidies in Japan in 1999 were \( $11,792 \) in EC, \( $831 \) in OECD, \( $218 \) in USA. In India it was \( $53 \). Similarly, the per farmer subsidy in 1999 was \( $26,000 \) in Japan, \( $21,000 \) in USA, \( $9000 \) in Canada, \( $17,000 \) in EC and \( $11,000 \) in OECD. In India, the same was \( $66 \). The aggregate subsidy for agriculture in India was estimated at \( $8.50 \) billion in 2001-02 as against \( $49.08 \) billion in USA, \( $47.20 \) billion in Japan and \( $115.33 \) in European Union.

5.1.11 The Aggregate Measure of Support [AMS]\(^6\) does not include support directly to producers, infrastructural services, pest control, environment programmes, inspection and market intelligence etc., which are clubbed under green box and exempted from reduction commitments. The developed countries have been providing very substantial support to their agriculture under ‘Green Box’ so much so that it would appear to be more apt to term Aggregate Measure of Support as Partial Measure of Support\(^7\). As per available data, out of total domestic support provided by developed countries very large amounts are included in Green Box [Table 2]

<table>
<thead>

</tr>
</tbody>
</table>

\(^4\) \$ is US $  
\(^6\) WTO agreement envisaged two kinds of support to agriculture, viz. domestic support and export subsidies. The domestic support is classified into five categories: [a] Aggregate measure of support [AMS] which includes product specific and non product specific support, [b] Green box support [c] Blue box support [d] De minimum support and [e] Special and differential [S & D] treatment box. Out of these, agreement requires reduction only in AMS and export subsidies, whereas support under all other heads is exempted.  
The AMS includes [a] sum of total subsidies on inputs like fertilizers, water, credit and power etc. and [b] market price support measured by calculating the difference between domestic administered price. Normally, the term AMS gives the impression that it is the sum total of all kinds of support. But in reality it is not and huge subsidies provided by developed nations to its agriculture are hidden in blue box.  
\(^7\) Dr. Ramesh Chand- Trade Liberalisation WTO and India Agriculture.
In view of the above, it is clear that the AMS covers only a part of the support extended by the developed countries and unless all kinds of support are clubbed together and reduced, the developing countries would find it extremely difficult to improve their trade.

5.1.12 The competitive advantage is a dynamic concept and the position changes with the changes in prices and yields. **However, the competitiveness in costs alone is not enough to succeed in exports. The quality of the produce and reliability of supply are other very important factors.** A significant increase in productivity could improve competitiveness of products which are not competitive at the current levels of yields and prices. The large gaps between the domestic and world yields reflect that the potential for raising productivity is immense provided appropriate steps are taken. **Table 3** shows the average Indian yield as a percentage to the average world yield and to the yield of top five exporters.

5.2 Measures to Improve Competitiveness

A. Crop Productivity Related

Deceleration in Growth Rate – Need to Strengthen the Resource Base of Agriculture - More Investment Needed

5.2.1[i] The slow down of yield growth rate of crops in India during the nineties is very clearly is shown in Table 4.

Table 4: Trend Growth Rates of Yields 1970-71-2000-01

<table>
<thead>
<tr>
<th>Period</th>

Source: FAO

5.2.1[ii] The slow down in capital formation in agriculture in the eighties and nineties, was one of the major reasons for deceleration in agricultural growth. The gross capital formation in agriculture which formed 15.44% of the total capital formation and 9.92% of the Agriculture GDP in 1980-81 came down to 7.96% of the total capital formation and 8.02% of the Agricultural GDP in 1999-2000. Further, trend rate of growth of Gross Capital Formation in Agriculture [GCFA] which was 5.05% per annum in the 1960s accelerated to 8.7% per annum during 1970s, fell to 0.331% in the 1980s and marginally recovered to 2.89% per annum during the 1990s. The share of public sector capital formation to the total capital formation in agriculture also came down from 51.3% in 1980-81 to 25.34% in 1998-99. It is important to remember that private sector investment is not a substitute for public sector investments. Private sector investment is mainly in well endowed irrigated areas [almost bypassing rainfed areas] and in projects with comparatively shorter gestation period. The public and private sector investments need to compliment each other. The investments in storage, post harvest management, processing, tubewells etc. could be more efficiently handled by private sector and the Government needs to encourage it by creating enabling/encouraging environments for the purpose. Measures like developing a suitable scheme for compensating the farmers on
failure of borewell and encouraging development of water markets i.e., sale of well water by farmers owning/installing tubewells etc. could help in private sector capital information. However, the public sector investments in agriculture related infrastructure particularly irrigation including assured supply of water, power, research and other development works is crucial for a well spread and sustainable high growth rate. Completing incomplete irrigation projects, modernizing and improving irrigation structures where necessary and improving the quality of irrigation should get a very high priority besides the creation of new irrigation facilities. The need to improve productivity of public sector investments [roads, irrigation, power etc.] by better management including maintenance/distribution can hardly be over emphasized.

**Box II**

**Infrastructure Investment fund for Farmers (IIFF)**

The investment in agricultural sector has nearly stagnated during the last three five year plans. However, the Government have paid attention to investment in agriculture of late. It set up Rural Infrastructure Development Fund (RIDF) in NABARD in 1995-96 to provide loans to the State governments for projects in irrigation, electricity supply, marketing of agricultural products and rural roads, rural development etc. The RIDF investment falls short of requirements for rural infrastructure needs of the country. There is need to have an Infrastructure Investment Fund for Farmers (IIFF).

Can the funds be raised from any other sources? Is there such a source available?

India has accumulated foreign exchange reserves (FER) of $165 billion equivalent to about Rs.7.2 lakh crore. These have been sterilized. A part of FER is non-debt creating which means there is not much fear of flight of foreign exchange in respect of such amount. Considering the need to utilize the idle FER, Dy. Chairman, Planning Commission, took up the issue with the Ministry of Finance for utilizing FER for increasing investment in industrial infrastructure. Appreciating this novel move, the Finance Minister in his Budget 2005-06 made provision of Rs.10,000 crore for funding viable infrastructure projects through Special Purpose Vehicle (SPV) for utilizing FER for roads, ports, airports and tourism sectors at low interest and long maturity period. The pattern of earnings of FER shows that the return on FCA and gold, after accounting for depreciation, decreased to 2.1% in 2003-04 from 3.1% during 2002-03.

The proposed IIFF could be used mainly for infrastructure investment for farmers, targeting and monitoring income generating schemes, and improving marketability of their produce. The IIFF can also be funded by floating Farmers’ Development Patras (FDP) and other resource raising measures.

India is not the first country to use its FER for infrastructure investment. The Chinese government used FER of $45 billion to fund a new institution, the Central Huijin Investment Company, like our SPV, which in turn funded the Bank of China and China Construction Bank for infrastructure development. Recently in April 2005 Chinese government authorized a $15 billion bailout package to financially weak lender-Industrial and Commercial Bank of China-(ICBs).

5.2.1.[iii] During the nineties the profitability in agriculture declined by 14.2% mainly due to stagnancy of yield growth and increase in prices of purchased inputs outpacing
increase in output prices. The declining profitability in agriculture also led to stagnation of private sector capital formation from towards the end of the nineties. The private sector investment in agriculture during 1999-00 was Rs 35,319 crore (New series at 1999.00 prices) which increased to Rs 38,215 crore in 2001-02 and consistently fell thereafter and reached a low of Rs 30,532 crore in 2004-05 (quick estimates). The data regarding capital formation from 1990-91 is given in Table 6.

Source: Central Statistical Organisation - Published in RBI, Annual Report 2005-06.

These trends have to be reversed and the resource base of our agriculture needs to be strengthened and private investments encouraged on a priority basis.

**Soil Health Enhancement**

5.2.2 Soil health enhancement holds the key to improve productivity and returns from investments in inputs like seeds, fertilizers, other nutrients and water. As recommended in the Action Plan for the Year of Agricultural Renewal [Second Report of
the National Commission on Farmers] the need is to re-tool and re-equip all Soil Testing Laboratories [STL] in order to enable them to provide each farm household with a Soil Health Card, containing integrated information on the physics [soil structure, occurrence of hard pan in subsoil etc.] chemistry [soil organic matter, macro and micro nutrient status] and microbiology [occurrence of earthworms, soil microorganism etc.] of the soil and also establish new STL where needed. The soil health cards should stimulate efficient use of plant nutrients and amelioration of micro-nutrient deficiencies which could go a long way in improving competitiveness of our agriculture by improving productivity and reducing cost per unit of output.

**Extension Services**

5.2.3 Extension has become extremely weak [the vigour of the Green Revolution years is no more visible], with nearly all the States keeping large unfilled vacancies in the Department and the available staff being engaged in sale/distribution of seeds etc. rather than doing extension work. The role of the extension system is to act as a conduit between the scientists and the farmers. With the near collapse of the extension services and only a few instances of private enterprise entering the field of extension of technology, the main source of information on modern inputs for the farmers are the input suppliers who have a field day in ‘educating’ farmers in the use of purchased inputs. They naturally have a vested interest in increasing the use of inputs they might be dealing in irrespective of their impact on productivity. Field studies are suggestive about the disproportionate use of all inputs on farms, leading to excessive costs without corresponding increase in productivity. While efforts need to be continued for encouraging private entrepreneurs in extension services, the present situation is not satisfactory. The Krishi Vigyan Kendras [KVKs] have also not performed to their potential. The Central Government and the State Governments need to work together to improve their effectiveness. The State Agriculture Department at the district level needs to have close and effective linkages with the KVKs. The KVKs should also have well equipped laboratories for detailed soil testing and also trained manpower for the purpose of testing and advising the farmers.
Research and Technology Related Issues

5.2.4[i] Another important aspect is that international research is increasingly getting privatized, the outcomes [seeds and other scientific inputs] are likely to be supplied by multinational companies at a very high price [as experienced by Indian farmers in respect of Bt Cotton seeds] leading to various problems. Dependence on multi-national companies for supply of seeds including genetically modified seeds would place the small and marginal farmers to a great disadvantage due to the very high prices. As nearly 80% of farm holdings in India are less than 5 acres [small and marginal holdings] the costs of purchased inputs have a strong bearing on its usage. It is crucial that research efforts in frontier fields are increased within the country, which would require much larger investments and a high degree of accountability of the research institutions. The research has to be market oriented with focus on technology development and reaching the farmers. The progress in achieving yield growth need not wait till new technologies become available. However, different approaches based on local socio-economic and agro-ecological conditions would be required. According to Prof. M.S. Swaminathan, technologies should aim at three time dimensions-

- **Immediate:** Technologies already developed and available for immediate dissemination
- **Medium-term:** Technologies in the pipeline which need testing, incubation and adaption.
- **Long-term:** Strategic research aimed to develop new technologies through the use of new genetics and other areas of frontier science and technology. Anticipatory research is also needed to meet potential changes in climate, particularly temperature and precipitation.

5.2.4[ii] There is a silver lining to otherwise gloomy situation. With a large pool of capable scientists available across the country, it is possible to considerably improve the in house research and technological support to our agriculture. According to Prof. M.S. Swaminathan,\(^8\) “Among the frontier technologies relevant to the next stage in

---

\(^8\) Enhancing our agricultural competitiveness – Current Science, Vol 85, No. 7, 10 October 2003
agricultural revolution, the foremost is biotechnology.” In his view, India has a natural advantage in becoming a world leader in food and agricultural biotechnology due to a large biodiversity which serves as feedstock to biotechnology. According to him, the work already done in India in molecular breeding techniques etc. reveals the immense potential for breeding new Genetically Modified varieties [GM varieties] possessing tolerance to salinity, drought, some major pests, diseases with improved nutritional value. The National Commission has already recommended developing a National Food and Agricultural Biotechnology Policy together with implementation structures including an autonomous, professionally manned and managed Biotechnology Regulatory Authority.

Bridging the Technology Gap

5.2.5 Another important area is the dissemination of existing research knowledge and bridging the technology gap between different areas in the country. There is huge yield variation in different areas [For example, more than two thirds of the crop areas have an average yield below national average] which shows that the untapped production reservoir in the country even with the available technologies is quite high. The need is for special attention to dissemination of known technologies and reach in all parts of the country.

Knowledge Revolution

5.2.6 There is a need for greater stress on harnessing power of information and communication technologies for enhancing our agricultural competitiveness. Knowledge revolution in rural India would hold the key to improving productivity and competitiveness. The farmer has not only to have knowledge about various measures to increase productivity in the area of research/technologies, availability of inputs, their prices but also trade literacy regarding the market, time of demand, export practices etc. and the quality norms [codex standards and the sanitary and phytosanitary measures [SPS] applicable in the importing country]. The SPS conditions in different countries for different commodities also need to be consolidated for widespread dissemination. The

---

9 sanitary and phytosanitary' measures mean any measures adopted by a country to protect human, animal or plant life or health within its territory from risks arising from the entry or establishment or spread of pest or disease-carrying or causing organisms, animal, plants or beverages or foodstuffs.
Government of India have recently decided to support the Common Service Centre [CSC] Scheme as a national programme under the national e-governance Plan. This scheme [establishment of 1,00,000 CSCs] is integral to providing knowledge connectivity to farmers. Some of the basic guidelines suggested for knowledge resolution are:

- Connectivity and content should receive constant attention;
- Training should be imparted to farmers to access information;
- Information provided should be demand-driven and should be relevant;
- The Centres should operate on the principle of social inclusion and a revenue model.
- To be effective, linkages of lab to lab, lab to land, land to lab [flow of traditional knowledge and wisdom from farmers to technical experts] and land to land [lateral learning among rural families] have to be developed and maintained.

Input Use-Quality of Delivery-Improvements Needed

5.2.7 Precision farming techniques and improvement in qualitative aspects in the delivery of inputs including seeds, fertilizers, farm machines and implements water, energy, credit would increase productivity and reduce per unit cost of production. Qualitative aspect of seeds, pesticides/insecticides and their pricing needs urgent attention. Matters concerning seeds in relation to research, multiplication, availability, assurance regarding the qualitative aspects and prices have become extremely important and deserve urgent attention. Availability of quality seeds in different parts of the country in time and at appropriate prices is crucial. Availability of quality farm machinery and implements is also important. Most of the farm implements continue to be reserved for small scale industries [SSI]. The policy requires a relook to improve the quality of inputs and lowering of prices which could be possible with scale economies of production. The potential for export of these implements to Asian and African countries also needs to be explored. While credit delivery and increasing credit flow and the interest rates are getting considerable attention for the last 3-4, years the need for improving outreach, flexibility, simplification and timeliness of institutional credit requires a much
greater focus. Doubling of institutional credit without adequate attention to bringing in new borrowers and adequate expansion of investment credit would not be of great significance keeping in view the agricultural growth rate of less than 2% and nearly stagnating yields.

B. Marketing, Trade and Quality Related Issues

Efficient Marketing System

5.2.8 Marketing is becoming increasingly important. If appropriate technologies and remunerative marketing opportunities get integrated, impressive production gains and improvement in competitiveness could be achieved. In international trade, in addition to competitive cost and desired quality, the stability in supply is equally important. An efficient marketing system requires cost effective channels of transfer of produce, good infrastructure support, liquidity and market orientation among the producers. Extremely poor infrastructure, connectivity and a complete absence of market information means that the farmers can in no way respond to market signals. High transport and other market related costs could negate advantages of a cost effective production system. While commercialized agriculture is the basis of globalised agriculture, the Indian farmers are operating with a support system which is at best suitable for subsistence farming. This needs attention. Our agriculture marketing system is restrictive and regulated due to a plethora of laws which have also restrained private sector investments in this sector. The APMCs and State Agriculture Marketing Boards need to change their role from regulatory to promotional and developmental. These agencies should focus more on developing new markets for the local products. Their entire functioning, management, operations and disposal of surplus need a relook. The need is also to encourage and support the farmer’s cooperatives and private sector to operate the wholesale agriculture produce markets and provide competition to APMCs. [Various aspects connected with agricultural marketing reforms have been discussed in detail in the Second Report of the National Commission on Farmers, Aug 2005]
Box III

Quality Literacy on Codex Alimentarius Standard and SPS Measures among Farmers

The Agreement on the Application of Sanitary and Phytosanitary Measures (SPS) and the Agreement in Technical Barriers to Trade (TBT) both encourage the international harmonization of food standards. The SPS Agreement cites Codex standards, guidelines and recommendations as the preferred international measures for facilitating international trade in food. As such, Codex standards have become the benchmarks against which national food measures and regulations are evaluated within the legal parameters of the Uruguay Round Agreement.

The word Codex Alimentarius is taken from Latin and means a code of food standards for all nations. Codex was established in 1962 when the Food and Agriculture Organization of the United Nations (FAO) and the World Health Organization (WHO) recognized the need for international standards to guide the world’s growing food industry and to protect the health of consumers. The significance of the food code for consumer health protection was further underscored in 1985 by the United Nation Resolution 39/248, whereby guidelines were adopted for use in the elaboration and reinforcement of consumer protection policies. The Codex Alimentarius Commission (CAC) is an intergovernmental advisory body under FAO/WHO with current membership of 174 member countries.

The Government of India has been harmonizing its standards with the Codex requirements for food products. For the overall development and economic growth of the country it is essential that all players down to level of farmers and growers, food processors and trade understand the essence of international food regulations and standards such as Codex and WTO. A farmer has tremendous responsibility to produce agri-product of quality which satisfies the Codex requirement.

The Codex Alimentarius includes standards for all principal foods, whether processed, semi-processed or raw for distribution to the consumer. It includes provisions in respect of food hygiene, food additives, pesticide residues, contaminants, labeling and presentation, methods of analysis and sampling. Codex Food Standards, codes of practice and other guidelines protect consumers from unsafe food and fraudulent practices. At the same time, they allow food producers, processors and traders access to markets by breaking down artificial non-tariff barriers to trade. All products meant for sale have to be packed and labeled as per code requirement.

The benefits of international trade can be reaped only when the messages of Codex and SPS and TBT requirements reaches the farmer. This can be taken up as a societal programme by the Government and non-governmental agencies to disseminate the standard requirements and rules and regulations under Codex and WTO agreements. Emphasis may be given to them regarding how to reach the standard requirements by adopting Good Agricultural practices in the Farm and HACCP in the processing of agriproducts. Farmers must also be informed about the higher dividend he/she gets by adopting such practices consistently and continuously.

Post Harvest Operations and Value Addition

5.2.9 Post harvest infrastructure is grossly inadequate resulting in huge inefficiencies and wastages. In the Third Report of the National Commission of Farmers it was suggested that about 60,000 lab to land demonstrations may be organised in the post-harvest handling, processing and value addition. Help of CSIR and the Central Food Technology Research Institute [CFTRI], Mysore may be taken by the ICAR while designing these programmes. It was also suggested that a post-harvest technology wing should be added to every Krishi Vigyan Kendras. Poor quality standards, and
absence of grading, low value addition make our products comparatively uncompetitive/unacceptable in the international markets. This is also partly due to the obsolete methods of processing which need to be modernized. Agriculture and food processing activities require modernization and standardization not only in terms of investments but also in terms of enabling rules and regulations and a policy framework for operating in the globalised environments, attract greater investments and encourage the exports. **World over, the demand of processed agricultural products appears to have great growth prospects.** Being a very large producer of agricultural commodities, India can not continue to be a spectator in this sector. There is a need to harness export potential in the processed food sector and also more importantly to ensure that the domestic market is not lost to imports. However, entering or building export markets in processed food is not likely to be easy and require a strong policy support including liberal tax benefits/concessions etc. to start with and maintaining high standards of quality to meet Codex standards.

**Box IV**

**Lab to Land Technologies**

Utilising science for value addition for agricultural resources for sustainable livelihoods is crucial. Several technologies have been developed by the Central Food Technological Research Institute (CFTRI), Mysore, many of which have also been implemented successfully. The Agricultural Engineering Division of the Indian Council of Agricultural Research (ICAR) is also supporting a programme for developing region and commodity specific post harvest technologies through All India Coordinated Research Project on post harvest technologies with 33 centres across the country and is expecting to cover 60,000 farmers over a period of three years.

The lab to land programme has to aim at plugging the gaps between demonstration of feasible technologies and make farmers understand the need for total adoption of the package. The ultimate objective is that the innovation of the laboratories must reach the farmer and the grower for value addition to their agriculture products and lead to increased farm incomes. A large number of technologies are available off the shelf with CFTRI. The available technologies range from processing of fresh fruits and vegetables to cereal based products like rice flakes and papads, spices and condiments, with the capital investment required ranging from Rs. 1 lakh for papad to Rs. 35 lakhs for making jowar flakes.

Any fruit and vegetable processing unit requires a license from the Ministry of Food Processing Industries and all products have to comply with regulatory standards of the country viz, Agmark, BIS. Transfer of Technology also has to be accompanied by training on Good Harvest Practices and Good Manufacturing Practices and packaging.

Availability of such off the shelf technologies backed by technical and financial support can lead to growth of a large number of small, tiny, cottage and village industries providing employment in rural areas and help cascade the production by masses into mass production.
Trade Responsive Measures

5.2.10 Indian agriculture will have to become progressively more and more trade responsive to meet the challenge of globalization. For this purpose reliance may have to more on market related instruments like tariffs, credit policies, public investments complimenting community initiatives and to develop market structures etc. The need is, therefore, to build markets, design financial institutions and strategic organisational structures which work and provide finances for communication, processing, standardization, quality upgradation and trade.

Box- V

Common Commodity Organizations (CCO)

Out of 178.25 million farmers, 138.85 million (76.7%) are food grain farmers and 13 million farmers produce cotton and sugarcane. They have suffered income erosion during the last five years and prospects of improvement does not appear to be very bright. The specific commodity-farmer centric measures that will improve their lot will have to be designed. The CCOs could evolve supply demand management suitning the market changes and thereby increase farmers’ incomes. CCOs will work as pressure group to monitor farmers’ income and safeguard their economic interest.

The need has arisen for CCOs when surpluses have arisen in agricultural commodities and markets are getting unfriendly to farmers resulting in falling incomes of the farmer and sometimes suicides. The CCOs is a common feature in European Union (EU) and USA such as the National Cotton Council, American Soyabain Association etc. Recently American Soyabain Association prevailed on President of USA to increase Soya fuel mix with petrol to 20% that benefited the Soya farmers by $2000 per farmer. The Tea, Coffee and Spices Boards are examples of such CCOs in India.

C. Other Issues

Small and Marginal Farmers – Institutional Support

5.2.11 Institutional measures that could help the small and marginal farmers in sharing the potential gains of growth and increase the exports are needed. According to Prof. G.S. Bhalla, a proactive policy should be designed to involve the small and marginal farmers in deriving the benefits of exports through innovative institutions like the milk co-operatives of Gujarat and contract farming etc. However, contract farming arrangements are often a contract between two unequal players. Complaints about inadequate guidance in input use and farm practices as well as non-enforcement of contract are voiced frequently. However, where contract farming is organised in the cooperative mode, with major say of the producers at all the stages of value chain, it may
help in improving productivity and give a better share to the producer from the consumer’s rupee besides insulating him from the market risks. The efforts on production front have to be supported by creation of specialised institutions like trading houses, market intelligence services and creation of network of information regarding national and international prices for benefit of farmers and more particularly small farmers. Cooperatives could be a good organisational structure for these institutions.

**Priority for Switching Over from Low Value Agriculture to High Value Agriculture**

5.2.12 The need is to move Indian agriculture from low value agriculture to high value agriculture and from low yielding activities to a dynamic competitive sector capitalizing on its inherent advantages. **Dr. Y.K. Alagh**\(^{10}\) has suggested that to make the agriculture competitive, the farmer has to be supported in terms of cost of production of efficient farming. Those costs monetize existing practices, meet the immediate cost of technology adoption and learning and would sometimes embody in new inputs. Many of these would be of immediate kind and after initial thrust and support; the farmer would compete on its own. While the capital cost for such an economy at the margin would be higher than the historical costs, the current output costs would be lower per unit of output. This shift would require larger working capital.

5.2.12[i] **India could also become a potential outsourcing hub for agriculture due to its vast size and diverse agro-climatic conditions provided we take steps to enhance global competitiveness of some selected commodities in specific areas where we have strength.** For that purpose apart from taking general steps like improving productivity, support of research and extension and market reforms, a broad strategy as under could be considered.

- Identifying specific regions having strengths in particular commodity to promote exports by improving competitiveness [for example organic spices, niger and other products in tribal areas of Orissa, Chattisgarh or “basmati” rice in Punjab and Haryana or fruits in Maharashtra].

\(^{10}\) “Prospects and Problems” in Yojana, August 2006.
• Value addition through vertical integration of farmers with agro-processing industries since efficient value addition would enable the processed product to focus on appropriate market segment to gain competitiveness. Agro-processing and value addition can also be taken up by Farmers’ companies, cooperatives, groups with professional management.

• Improving rural infrastructure in these identified regions to ensure production of international quality processed goods.

Need for Proactive Advice – Land Use Boards – Restructuring

5.2.13 The existing Land Use Boards are not equipped to provide proactive advice to farmers on land use planning. Without economically and ecologically sound and proactive advice on land and water use, farmers have to fend for themselves in taking decisions on what to grow, how much to grow etc. With the spread of agricultural globalization, this could be disastrous to the economic health of the farmers. **There is urgent need for National Land Use Advisory Services, linked to State and Block Level Land Use Advisory Services on a hub and spokes model.** As recommended in the Second Report of the National Commission on Farmers, these could be virtual organisations with capacity to link land use decisions with ecological, meteorological and marketing factors including exports/imports on location and season specific basis.

Indian Trade Organisation [ITO]

5.2.14 The National Commission on Farmers has recommended establishment of the Indian Trade Organisation [ITO]\(^\text{11}\) specializing in WTO affairs and ensuring adequate livelihood protection of Indian farmers. It could be a virtual organisation to serve and assist the Government in taking informed and proactive decisions. The proposed National Land Use Advisory Service and the ITO may have to work in close coordination to be able to render proactive advice on land and water use keeping in view the local and international markets and trade opportunities.

---

Agriculture in the Concurrent List

5.2.15 Agriculture by its nature cannot be centrally managed in a very efficient manner even at a local level. At the same time a vast number of farmers cannot effectively confront liberalized and globalised market condition; they must come together to safeguard their interest and also to make a better deal for themselves. The European Union [EU] has handled agriculture differently than the industries. The members of EU have virtually given up their independent decision making as relating to agriculture and introduced a Common Agriculture Policy [CAP]. This is in sharp contrast to the situation in India where agriculture is a State subject, although crucial decisions relating to credit input, output pricing and research and extension are made at the centre. The States could have different and even conflicting policies with respect to issues like standards, environment etc. As a matter of fact, the States do have differences in octroi, local taxes, charges levied by APMCs for marketing, levies etc. The need is perhaps to bring more uniformity and move towards a Single Market\(^\text{12}\) by facilitating/simplifying movement of goods [replacing annual road tax and removal of fitness certificate by a life time payment/system, introducing National Permit for plying commercial vehicles anywhere in India], fiscal matters [introduction of uniform VAT all over the country, uniformity in taxes on commodity, withdrawal of octroi and local taxes] matters relating to tax administration [avoid using the border posts for collection/verification of payment of taxes] etc. These measures would help in enlarging small regional markets into a large national market, reduce transportation cost and improve competitiveness of our agriculture. It may be useful to consider bringing agriculture to at least the Concurrent list, so that the principles of an India Single Market as well as issues relating to prices, production, diversification etc. could be examined by the Centre and States in a participatory mode in the overall interests of farmers and farming.

5.3 Need for Greater Support to Backward Regions/Communities

5.3.1 While agriculture is moving towards liberalisation and globalization let us not forget that agriculture is a way of life for most of our rural population and their only

means of livelihood [most of them have neither education nor skill nor capital to take up any alternate livelihood]. Agriculture is also the embodiment of country’s culture and environment. **We need to give highest priority to our people and local requirements.** About 120 million farming families represent over 60% of our population. It is absolutely necessary to take care of the interests/concerns of this vast rural population and particularly the economically [mainly agriculturally] backward regions and communities. The vast majority of our farmers have very small holdings [less than 5 acres] and do not have either the resources or capability to easily move away from the crop rotation being followed by them and take up new crops. The cost of making such changes in terms of crop specific investments, arranging seeds/other inputs and marketing is likely to be beyond them. These farmers would find it difficult to respond to take advantage of market signals and are likely to suffer greatly from cheaper import of crops produced by them howsoever, small the imports may be. The Government would require to closely watch such imports and take prompt and appropriate tariff measures to minimize the adverse impact on them. Further, the developed countries have exploited various exemption clauses and the ‘Green Box’ under WTO and are able to protect their farmers and farming. [Annexure II gives details of various programmes which support farmers and are exempt from the AMS]. We have therefore to be very careful in tariff related matters to ensure that the livelihood of our farmers is not adversely affected.

### 5.4 Conclusion

5.4.1 Indian agriculture is undergoing structural changes in recent years and this has enhanced the market induced vulnerability of a large section of our farmers. The progressive integration with global economy means that our farmers are also increasingly being exposed to price fluctuations at the international level. These changes have taken place when the rate of growth in agriculture production is decelerating, farm sizes becoming smaller and smaller, inputs becoming costlier and the farmer having to rely more and more in purchased inputs for cultivation. The cost-risk return structure of farming is becoming increasingly adverse. **As the risk mitigation measures are not effective across the country and the prevailing safety net provisions, are either**
grossly inadequate or delivered very inefficiently, it leads to a near crises situation for farmers in many regions of the country.

5.4.2 Various measures are necessary mainly in insurance, credit, employment creation, social security, empowerment, education, skill building and improving sharing of information and knowledge to save the vulnerable sections of our rural families on an urgent basis [most of these could be WTO compatible as already stated in earlier paragraph]. **We also cannot ignore the challenge being faced by Indian agriculture in the wake of liberalisation and globalization.** The process of integration with the world economy would continue bringing many more challenges and also some opportunities.

5.4.3 **The need is to build on our strengths to take advantage of some opportunities that come our way.** The diverse agro-climatic conditions, the rich biodiversity, one of the World’s largest agriculture research system, a vast domestic market, largest irrigated area in the world, huge land size and arable area, innovative and hard working farmers who have a record of succeeding in adverse conditions present a huge potentials and opportunities to our agriculture. **Improvement in delivery of services (credit, insurance, extension, research/technology support) availability of quality inputs like seed, energy and water, increased investments for strengthening the resource base of agriculture, relook at the various laws/enactments and policies would be needed to take advantage of the developments by improving competitiveness of our agriculture.** These developments coupled with regular supplies, quality consciousness and reducing transport costs, statutory charges, market handling charges, processing costs etc could improve our exports more so if the developed countries reduce their subsidies and play the game as per the spirit of the game and give increased market access to the developing nations. It would be equally necessary to be watchful in the international front regarding imports which could seriously impact the livelihood of our farmers by watching the subsidies given by other countries and fine tuning our tariffs.
5.4.4 Let us also not forget that international agriculture markets are not perfectly competitive in character. Trade in agricultural commodities is dominated\textsuperscript{13} by a few very large international companies [mostly from US, Western Europe and Japan etc.] which enjoy considerable clout and unique position. The agricultural trade liberalisation could minimize tariff and non-tariff barriers to trade but cannot ensure perfectly competitive market structures. The apprehensions are that the developing countries would end up paying higher price [than what it would have been in a perfectly competitive market] for their imports and get lower price than what would have been possible for exports in a perfectly competitive market [Indian experience so far is not much different]. Further, the improvement in exports may also not translate much to the growth of welfare of the farmers as their supply response is not very elastic. The need is, therefore, to try for very substantial reduction in the export subsidies and domestic support given in the developed countries and simultaneously improve our irrigation, power supply, research support, extension, input supply etc., to bring about improvement in factor productivity to reduce the cost of production and improve competitiveness of our agriculture. However, we would require a differentiated approach to meet the emerging challenges of liberalisation. Our agricultural exports form only about 6.2\% of the value of our agricultural production. Thus, only a small proportion of our agricultural commodities enter the global market. It is of utmost importance that we take care of the farmer who produces to meet nearly the entire requirements of our population of 110 crores. The crops, including by products/processed products where we have export competitiveness need to be developed for export markets, with appropriate policy and other support measures ensuring all along that these are WTO compatible.

\textsuperscript{13} Three to six of the big companies handle 85\% or above share of world exports in wheat, coffee, cotton and jute. While 60\% of the World export of sugar, 70\% of rice, 70-75\% of bananas and 80\% of tea trade is handled again by 3-6 companies/firms.

Annexure - II
Agreement on Indian Agriculture under WTO, 1994

| ART. 1 | Domestic support through a publicly funded Government programme not involving transfer from customers and the support shall not have the effect of providing price support to the producers. |
| ART. 2 | Expenditure in relation to programmers which provide services or benefits to agriculture exempt from being considered under AMS. |
| ART. 3 | Public stock holding for security purposes exempt from being considered under AMS. |
| ART. 4 | Domestic food aid exempted from being considered under AMS. |
| ART. 5 | Support provided through direct payment to producers being claimed for exemption should meet the criteria under Art. 1 and Art. 6 to 13. |
| ART. 6 | Decoupled income support exempt from being considered under AMS. |
| ART. 7 | Govt. financial participation in income insurance scheme and safety net programmes exempt from being considered under AMS. |
| ART. 8 | Govt. participation in crop insurance for relief from natural disasters is exempt from provision of AMS. |
| ART. 9 | Structural adjustment assistance provided through producer retirement programme exempt from being considered under AMS. |
| ART. 10 | Structural adjustment assistance provided through resource retirement programme exempt from being considered under AMS. |
| ART. 11 | Structural adjustment assistance provided through investment aid exempt from being considered under AMS. |
| ART. 12 | Payments under environmental programmes exempt from being considered under AMS. |
| ART. 13 | Payments under regional assistance programmes exempt from being considered under AMS. |

CHAPTER 6
STRENGTHENING THE COPING CAPACITY OF FARMERS UNDER AN UNCERTAIN TRADE ENVIRONMENT

6.1 The Context

6.1.1 During the past decade and a half, the Indian farmer has faced three episodes of uncertainty, in the context of the globalisation of the economy. The first came from the policies of liberalisation that were adopted in the early 1990s, which were accompanied by steep reduction in tariffs, on commodities including agricultural commodities.

6.1.2 The second episode of liberalisation was brought by India’s accession to the WTO. In this episode, India was required to remove its quantitative restrictions maintained for balance of payments purposes and this affected a considerable proportion of the agricultural sector. However, a section of domestic producers received some succour in the form of high levels of tariff bindings\(^1\). India’s high tariffs\(^2\) are now under the scanner with many of its trading partners insisting that these high tariffs must be lowered for promoting agricultural trade. The on-going Agriculture negotiations in the WTO that are being conducted under the rubric of the Doha Round have seen such demands being made by many developed countries that have substantial interest in the global market for agricultural commodities.

6.1.3 The third, and the most recent of the episodes of trade liberalisation, has come in the form of the Free Trade Agreements (FTAs). Although only a few of the FTAs involving India have come into effect, a large number of these are currently being negotiated. More critical for India’s domestic agricultural interests are the proposed FTAs with the ASEAN and the PTA with MERCOSUR members. These groups have

---

\(^1\) At the end of the Uruguay Round negotiations, India opted for ceiling bindings, which allowed relatively high levels of tariffs to be imposed on at least the major agricultural commodities. Most primary agricultural commodities were bound at 100%, processed products at 150% and certain oilseeds at 300%.

\(^2\) India’s average bound tariff is 114.2%.
significant presence of agricultural exporters and whose major export interests include commodities in which India has sensitivities either from the perspective of food security or livelihoods, or both.

6.1.4 Trade liberalisation has also exposed the Indian farmers to the **risks associated with the widely fluctuating prices for agricultural commodities in the international markets**. During the past decade, international prices for the major agricultural commodities have gone down and have remained sticky at low levels. While the price fluctuations are natural, given the relatively inelastic demand for agricultural commodities, discriminatory policies followed by some of the larger players in the global markets for agricultural commodities, for instance the grant of high subsidies by the US and the EU, that have amplified the considerable uncertainties in the commodity markets arising from fluctuating prices.

6.1.5 The key issue arising in the context of the globalisation of the Indian economy relates to the **mechanisms that policy makers should adopt that would give a reasonable degree of comfort to the Indian farmers**. Policy makers would have to take measures to ameliorate uncertainties facing them, by taking two sets of initiatives. In the first instance, the policy response would have to be in the form of adequate levels of support to the farm sector so that cheap imports, or even a potential threat from cheap imports, do not create a situation where livelihoods are threatened. Secondly, comprehensive changes in agricultural policies must be put in place for reversing the declines in productivity and the consequent erosion of farmers’ incomes.

6.1.6 Recent developments have reinforced the point that Indian agriculture is on a knife-edge and that minor uncertainties in the agricultural markets can cause food insecurity and livelihoods concerns. India would have to argue consistently, as it has been doing in the WTO negotiations, that it would need to provide reasonably **high levels of protection to address the twin concerns of food security and support of livelihoods in the farm sector**. According to India, these concerns are part of the non-trade concerns that WTO Member countries have recognised as being of critical importance to developing countries.
6.1.7 One of the major areas of concern for Indian agriculture arises from the threat of cheap imports. Over the past decade, prices of major commodities have remained depressed in the international markets largely because of the weight of subsidies granted by the US and the EU. According to IMF statistics, between 1996-1999, and with a base of 1990-91, the price index has undergone a fall of –43.1%, –45.8%, –25.7% and –31.3% in respect of Cereals, Wheat, Rice and Vegetable oils and Protein meals respectively. Although the WTO Agreement on Agriculture (AoA) seems to have taken the initial steps towards reining in farm subsidies, the implementation of the Uruguay Round commitments have shown that very little progress has been made in this direction. Effective reduction of farm subsidies remains high on the agenda of the G-20 group of developing countries, which is led by India and Brazil.

6.1.8 Yet another effort was made by the developing countries in the 1970s and the 1980s for stabilising commodity prices. These countries could get the global community to agree to an arrangement that could ensure stabilisation of commodity prices. The establishment of the Common Fund under the aegis of the UNCTAD was a step in this direction. Although the UNCTAD initiative never took off the ground, the need for price stabilisation measures remains, nonetheless.

6.1.9 The second level of response, one that looks at the medium to the long run, should aim at reversing the productivity declines that the farmers have been facing in almost all major crops. This would require a package of measures that would include, *inter alia*, land reforms for addressing the problems arising from uneconomic land holdings, fragmentation of holdings, and easy access to technological inputs that promote sustainable agriculture, and better management techniques for utilising available resources more effectively. Only such a package can improve on-farm efficiency and can help bridge the productivity gap that prevents farmers in India from competing with the more efficient producers.

6.1.10 It needs to be clarified that price fluctuations in international market affect the Indian farmers in two ways. For commodities exported by India, the fall in international prices brings down the price realisation by the Indian farmers e.g. cotton. For
commodities imported by India, an increase in supply brings down domestic prices and also brings down the price realisation of the Indian farmers e.g. edible oils.

6.1.11 This Chapter analyses the implications of the process of globalisation on Indian agriculture by looking closely at four commodities, viz. pepper, coconut, cotton and oilseeds. The need to protect producers involved in the production of these commodities arises from the sizeable number of farm families and workers that are dependent on them. In other words, the issue of livelihoods security arises quite prominently in case of all the four commodities. The case studies bring out the issues involved and have relevance for other agricultural commodities too.

6.1.12 The analysis here would also explore the policy options that need to be looked at for safeguarding the interests of the farmers engaged in the production of these commodities in particular and other crops with global ramifications in general.

6.2 Pepper

6.2.1 Pepper is a smallholder crop and linked to rural development and livelihood security. The pepper growers are full time workers in agriculture depending solely on the crop for livelihoods. Producers of pepper are mainly small farmers with average land holding size about one hectare. More than 17 million people are dependent on pepper cultivation for livelihoods.

6.2.2 Kerala is the largest producer of pepper – in 2003-04 more than 96% of the country’s production was accounted for by this state. In 1991, nearly 1,70,000 hectares were under pepper cultivation in Kerala, which was just less than 6% of the State’s gross cropped area, and by 2003-04, this figure had increased to more than 7%. Exports accounted for nearly three-fourths of the total production of pepper in 1999-2000. However, in the more recent years, exports have fallen to just over a fourth of the total production.
6.2.3 Trends in Pepper Production in India

6.2.3.1 Pepper production in India seems to have gone a full circle during the decade and a half since 1990. After experiencing considerable fluctuations in the first half of the 1990s, pepper production increased to its highest level in 1999. Thus, pepper production had increased by almost 60% from the trough of 48,000 tonnes seen in 1991.

6.2.3.2 Fluctuations in the level of production of pepper in India were driven to a significant extent by movements in domestic prices. The effect of prices on production was more pronounced since the late 1990s. Another feature of pepper production was that the levels were influenced directly by changes in area under cultivation. Thus, in 1999, when production had increased by nearly 60% as compared to the level achieved in 1991, area under pepper cultivation went up by 40%. In other words, until about the year 2000, changes in pepper production could be explained largely by commensurate changes in the area under cultivation. In the more recent years, this link seems to have been broken, as an almost stagnant level of area under cultivation has been witnessing fall in production.

6.2.3.3 This tendency in the later years was a reflection of falling productivity of pepper cultivation in India. After remaining constant at around 300 kg per hectare, pepper yield came down to nearly 200 kg per hectare in 2004. All this while, when pepper yield in India was stagnant, its main competitors, like Vietnam and Indonesia, had improved their position in the global market through efficiency gains. As a result, productivity gap between India and the other leading pepper producers increased quite considerably in the more recent years. The following discussion provides the details.

6.2.4 The Global Market Trends

6.2.4.1 Four countries provide the bulk of pepper produced globally. These countries, viz. Vietnam, Indonesia, Brazil and India, had a combined share of nearly 75% of the global production in 2004. Vietnam emerged as the largest producer in 2004, with a total production of nearly 96,000 tonnes. It had outstripped Indonesia, which was the largest producer since 1998.
6.2.4.2 Production trends of the four leading producers since 1990 indicate that the production centres have changed quite significantly during this period. Brazil was the largest producer in the beginning of the 1990s, after which the country’s production suffered a steep decline. Indonesia emerged as the top producer for a couple of years, only to be replaced by India. However, since 1999, India’s pepper production declined quite rapidly – from a high of 76,000 tonnes produced in 1999, which was close to 26% of the global production, India was producing only two-third of this level in 2004. What also needs to be pointed out is that since 1999, global pepper production has consistently increased on the backs of robust production performance by all the leading producers barring India.

6.2.4.3 The emergence of Vietnam in the global market for pepper has been the most remarkable development. In the beginning of the 1980s, the country was producing less than 1,000 tonnes of pepper, and within a decade, its production had exceeded 11,000 tonnes. But even after registering a ten-fold increase in production, Vietnam had no more than a 5% share of world production in 1991. However, with production increasing even faster during the 1990s, Vietnam had increased its share in the global production to more than 23% in 2004.

6.2.4.4 Explaining the above-mentioned trends in production across countries are the differences in their yields. For instance, India suffered a relative decline in the market share for pepper since it was the least productive among the four leading producers. While all other countries increased their yields since the late 1990s, yields declined in India during the past few years after remaining nearly stagnant between 1990 and 2001. What emerged from these trends was that in 2004, pepper yields in Vietnam and Brazil were higher by 10 and 12 times higher respectively as compared to that recorded by India. Interestingly, both these countries went through periods in which they recorded even higher levels of efficiency. An added matter of concern for India should be that in 2004, pepper production in the country was nearly 5 times lower than the global average.

6.2.4.5 India’s relative decline among the leading pepper producers was manifest in its declining shares in global exports. In 1999, India was the second largest exporter of
pepper, and the volume of exports from India was not significantly below that of the leading exporter, viz. Indonesia. Among the other leading producers, Vietnam had already started challenging the global market leaders, but Brazil was a considerable distance behind.

6.2.4.6 This situation underwent a rapid change since the beginning of the current decade. A more than 25% decline in production in 2002 turned India to the international market as a major importer. India’s imports of pepper, in terms of volume, increased more than five-fold within a period of three years, i.e. from 1999 to 2002. Consequently, India emerged as the third largest importer of pepper in terms of quantity.

6.2.4.7 It may be argued that this surge in imports has acted as an added disincentive for the pepper farmers in the country, whose long term prospects have looked dismal in the face of the secular decline in productivity levels of the crop. Aside from the structural nature of the problem that they face, attention must also be given to whether the pressures from the global market, particularly in terms of the relative movement in domestic and international prices have encouraged imports, thus affecting domestic production. The latter possibility would justify the use of tariff protection, at least in the interim, so that the Government can take measures to improve efficiency levels of the pepper producers in India. The following discussion looks at the details in this regard.

6.2.5 Increase in Pepper Imports: Role of relative price movements

6.2.5.1 At the outset, movements in producer price seen in India and its major competitor countries would be analysed. As is evident, differences in producer prices reflect the relative production costs, and this provides a basis for assessing the policy instruments that the government would need to put in place in order to safeguard the interests of the Indian pepper producers.

6.2.5.2 FAO database provides comparable sets of producer prices for two of India’s major competitors in the global market for pepper, viz. Indonesia and Brazil. This data are available for the period 1991-2003 (Table 1).

6.2.5.3 Data for producer prices provided in Table 1 show interesting tendencies across countries. Producer prices have remained relatively low in India despite the fact that the productivity levels in the country are significantly lower than in the other countries. In case, the trends in producer prices seen in the above Table bring out the inherent limitations of the country’s pepper production system quite clearly. The smallholder dominated pepper production system in India was not able to benefit from scale advantages accompanying increases in production recorded in the second half of the 1990s. Thus, producer prices escalated with increased production and in 1999 when India recorded the highest level of pepper production, its producer price was almost a third higher than Indonesia, which was then the country’s main competitor.

6.2.5.4 Available data on producer prices indicate that in recent years India did not face any threat from Indonesia, the largest producer of pepper after Vietnam. Producer prices in Indonesia have been significantly higher as compared to those in India, particularly since 2001. More importantly, Indonesia seems to have lost ground in the global markets as its export volumes have seen sharp reduction.

---

3 During this period, India experienced downward movement in producer prices that accompanied declining production volumes.
6.2.5.5 However, Brazil did pose a threat to India, since it was able to bring down its producer prices quite appreciably. The sharp decline in producer prices recorded by Brazil since 2000 was reflected in the country’s growing presence in the global markets. In 2004, Brazil was the second largest exporter, having upstaged Indonesia.

6.2.5.6 Relative movements in domestic and international prices captured in Table 2 also suggest that Indian producers do not face an apparent threat from imports, given that the latter have exceeded the former by an average of nearly 20% in recent years.

6.2.5.7 Evidence presented above would suggest that the Indian pepper producers do not face any competitive threat from imports at present since domestic prices were considerably below international prices. Furthermore, imports have increased during the past few years not because of the worsening competitive strengths of the Indian producers but for meeting the slack in domestic demand arising from the shortfall in production.

6.2.5.8 A closer evaluation of available data, however, indicates that cheap imports are a potential threat to Indian producers. Data on unit values of import of pepper show that during the past few years two of India’s principal competitors, viz. Vietnam and Brazil, exported below international prices, while Indonesia exported pepper at prices that were below the corresponding domestic prices. Table 3 provides the details.

6.2.5.9 The actual threat faced by the domestic producers from cheap imports, originating in Vietnam, in particular, can be gauged by observing the tariff-adjusted import parity prices. Import tariffs on pepper were bound at 100%, while the applied rate was 70%. Table 4 provides a comparison between domestic prices and the tariff-adjusted import parity prices; the latter having being based on Vietnam’s unit values of imports.

6.2.5.10 Table 4 shows that barring 1999-2000, tariff-adjusted import parity prices for pepper have been above India’s domestic prices. Since 2003, however, steep fall in international pepper prices have significantly reduced the difference between the two sets of prices.
6.2.5.11 From the above discussion it can be surmised that India’s pepper producers do face an import threat as the two major exporters, viz. Vietnam and Brazil, try to expand their presence in the Indian market. But it is the formalisation of the Indo-Sri Lanka Free Trade Agreement (ISLFTA) that poses the biggest threat to the domestic pepper producers. It has widely been reported that ISLFTA has provided an opportunity to pepper originating from Vietnam to use Sri Lanka as a conduit to gain access to the Indian markets. The evidence above supports this point of view. Pepper imports from Sri Lanka have increased substantially since 2002, i.e. after the ISLFTA has come into operation.

6.2.5.12 A two-pronged strategy can therefore be suggested to protect farmers engaged in pepper production. The short-term strategy would entail imposing appropriate levels of tariffs that effectively address the problem of cheap imports finding their way into India. In this regard, Vietnam poses the greatest threat since it has been found to be exporting pepper considerably below the international price. Accounting practices of the transition economies is not easy to decipher, and consequently comparable data on their cost of production are not available. It is therefore, imperative that adequate attention is given for protecting the interests of the pepper producers in India.

6.2.5.13 Alongside the short-term strategy, a medium to long-term strategy also needs to be adopted. This would entail addressing the problems of declining production and productivity that face the pepper producers in India. A well-coordinated strategy should be put in place in this regard. Besides providing means for the farmers to benefit from technological advancements, it is necessary to give due consideration to the institutional bottlenecks that prevent the farmers from maximising their returns on investment.

6.3 Coconut

6.3.1 The Domestic Scenario

6.3.1.1 Production of coconut in India has shown an upward trend over time. It increased from 5883 million nuts in the triennium ending 1982-83 to 12486 million nuts in 2002-03. However, annual growth rate of coconut production declined from about 7% during 1982-83 to 1992-93, to just 0.4% in the period 1992-93 to 2002-03. Drastic fall in
production in Andhra Pradesh, Tamil Nadu and Kerala, the three largest coconut-producing states, was largely responsible for the considerable slackening of coconut production.

6.3.1.2 The area under coconut cultivation expanded from 11 lakh hectares in TE 1982-83 to nearly 19 lakh hectares in TE 2002-03. But during these two decades, the rate of growth of area under coconut cultivation suffered a steep decline. While area expansion was 3% per annum during 1982-83 to 1992-93, it fell by one-half during 1992-93 to 2002-03. And, perhaps more importantly, since the beginning of this decade, area under coconut cultivation suffered an absolute decline.

6.3.1.3 Alongside production, coconut yield also declined during the present decade, after reaching its peak in 1998-99. As compared to peak level of 7821 nuts per hectare in 1998-99, coconut yield declined to 6422 nuts per hectare in 2002-03, a fall of nearly 19%. The drop in yields occurred as Andhra Pradesh and Tamil Nadu, the two high acreage states, recorded negative growth during this period. Contributing to the problem was the presence of large number of senile and uneconomic palms, small and fragmented holdings and lack of irrigation.

6.3.2 Global Trends in Coconut Production

6.3.2.1 India is the world’s third largest producer of coconuts, behind Indonesia and the Philippines. In 2004, Indonesia produced more than 16 million tonnes of coconut in 2004, which was the culmination of a steady increase recorded since 1999-2000. As regards the Philippines, the period between 2002 and 2004 was one in which the country was seeking to reverse the decline in production witnessed since the mid-1990s. India, on the other hand, experienced an increase in production during the first half of the 1990s, following which a steady decline in production was registered. Although its 2004 production of 9.5 million tonnes marked a recovery from one of the recent troughs reached in 2002, it remained well below the record production levels achieved in the early 1990s.
6.3.2.2 The three leading producers accounted for almost 75% of the global production of coconuts. Data available for the period 1990-2004 show that the three countries had near constant shares in global production throughout. While Indonesia, the world’s largest producer of coconuts, had a 30% share, the Philippines and India maintained their shares at 27% and 20% respectively.

6.3.2.3 Among the leading producers, Indonesia recorded the fastest growth in coconut production between 1990 and 2004, which was somewhat higher than the global average. In fact, all the three leading producers increased their production of coconuts in excess of the global average. But, for India, trend growth in output was positive only during the first four years of the 1990s, following which a marginal negative trend was observed.

6.3.2.4 Although coconut yields in India were comparable with the world average, its inability to maintain the impressive growth in yields registered during the first half of the 1990s is a cause for concern. This is where India differs from the other major coconut producers. While Indonesia managed to consistently increase coconut yields, the Philippines took rapid strides at improving the yields.

6.3.2.5 India’s future prospects do not look very promising as the major coconut producing states have been experiencing downturn in production and productivity in recent years. This spectre of declining productivity levels raise concerns about the ability of the Indian producers to meet price competition from their counterparts in countries like Indonesia, which have benefited from the secular increase in coconut yields. This issue would be analysed in the following section.

6.3.3 Price Competitiveness of the Indian Coconut Producers

6.3.3.1 Here, the analysis would be based on two sets of data. In the first place, FAO data on the producer prices of coconut would be used. This dataset is available from 1991 to 2003. The second set of data relates to prices of copra, for both domestic and benchmark international prices. The two datasets have been used independently to comment on the relative efficiency or otherwise of the Indian coconut producers.
6.3.3.2 Table 5 provides a cross-country comparison of coconut producer prices for the period 1991-2003.

6.3.3.3 Barring the few years in the early 1990s, India was price competitive vis-à-vis Indonesia for most years during 1990-2003. But vis-à-vis the Philippines, price competitiveness of Indian coconut producers eroded quite significantly since the year 2000, when the former started reaping benefits from sustained increases in yields. However, the differences between producer prices existing in India and the Philippines were not large enough to offset the import duties that coconut attracts at present. The bound tariff for coconuts is 100%, while the applied tariff is 70%. This level of applied tariff protection is insufficient for Indian farmers and increased imports seen in recent years have acted as a disincentive to them.

6.3.3.4 In case of copra, India’s benchmark prices for the product, viz. the minimum support prices remained consistently above the international prices. Copra attracts an import duty of 70%, and even at this level of protection, domestic producers find themselves unable to safeguard their interests. This becomes evident if domestic copra prices are compared with the tariff adjusted import parity prices (Table 6).

6.3.3.5 The differences between the MSP and the tariff adjusted import parity prices that have been seen particularly in the more recent years provide a strong justification for the imposition of tariffs that would be close to, if not equal to the WTO bound rates. Coconut tariffs are currently bound at 100%, but the applied tariffs for fresh and desiccated coconuts have been kept fixed at 70% for some years now. It is clear that the current applied rate does not provide adequate protection to domestic copra producers and that increase in imports that have been seen since the beginning of the current decade have acted as a disincentive for them.

6.3.3.6 The threat to domestic producers could increase manifold if the proposed FTA with the ASEAN that India has been negotiating takes effect. Adequate care must be taken to ensure that commitments to introduce a duty-free regime in coconuts are not taken as a part of this FTA. In the ensuing FTA negotiations, primacy must be given to protecting livelihoods of the coconut producers who are essentially operating at the margins. It may be unfair to compare the efficiency and productivity of farmers growing coconut in their homesteads and commercial plantations in other countries.
6.4 Cotton

6.4.1 Domestic Production Scenario

6.4.1.1 Cotton is among the more significant commercial crops produced in India. Between 1999 and 2001, cotton was produced on nearly 5 per cent of the country’s gross cropped area. This share is not-too-insignificant considering that food crops account for about two-thirds of the country’s gross cropped area.

6.4.1.2 Cotton production has witnessed a steady increase since the mid-1980s due to improvements in both area and yield. In the 1990s, production growth experienced a slowing down because of sharp decrease in yield gains. However, since 2000, rising yields and, more recently, an increase in area have revived production growth.

6.4.1.3 Cotton producers in India have made huge strides forward in cotton production, increasing their average yields from just over 0.2 tonnes per hectare in 1999-2000 to nearly 0.5 tonnes per hectare in 2004-05. Consequently, cotton output more than doubled from just less than 12 million bales in 1999-2000 to over 24 million bales in 2004-05. Most of this expansion was registered in 2004-05, a year that saw a 5 million bale surplus being generated (Table 7).

Source: USDA

6.4.1.4 The increase in cotton production in recent years brought a chronically deficit country to a situation where it is in a position to become a major exporter, thus threatening some of the large exporters like the US. But in a recent assessment of India’s potential in the global market for cotton, the USDA argued that India's expanding cotton production is unlikely to affect U.S. cotton producers, at least in the short term. But, if
India's cotton production continues to outpace its consumption needs for some more years, USDA expects Indian cotton to start displacing U.S. cotton in other markets.

6.4.1.5 A contrary view has also been presented by some commentators who opine that this impressive growth notwithstanding, it is uncertain if these gains will be sustained. Output continues to show large annual variations due primarily to weather-induced fluctuations. These commentators have further argued that India has to go a long way towards bridging the yield-gap, which exists vis-à-vis, the leading cotton producers. This aspect is dealt with in the following sections.

6.4.2 The Global Scenario

6.4.2.1 India is the third-largest cotton producer in the world. In the early 1990s, India was quite a distance behind China and the United States, the two leading cotton producers. However, following India’s strong performance since the year 2000, one that has not been matched by the leading duo, the gap between the top three producers has decreased quite significantly.

6.4.2.2 Area under cotton production in India is significantly larger than in any other country. Almost 25% of the world’s planted area under cotton is accounted for by India. At nearly 9 million hectares, cotton acreage in India is more than 70% higher than that in China. In recent years, there has been a slight decline in the area under cotton cultivation, possibly because of better land utilisation.

6.4.2.3 One of the prominent weaknesses of cotton production in India has been the relatively low average yield. Cotton yields in India were lower than those recorded by the top ten global producers, although in the past few years the gap has been decreasing. Moreover, progress in raising yields toward levels achieved by other major producers has been slow. Yield differences aside, the quality of cotton produced in India has often been found unsuitable by the domestic cotton mills. The quality of India’s cotton is often poor because an array of technical, economic, and institutional bottlenecks have affected the production systems. The extent to which these productivity and quality factors can be addressed will be critical in determining India’s competitiveness in global textile markets.
and whether rising cotton demand will be supplied by domestic producers or by global markets.

6.4.2.4 This raises the critical issue of relative competitiveness of cotton production in India. In many parts of the country, cotton farmers have argued in the past that the level of protection that the crop enjoys at present is threatening their livelihoods and that there is a need to calibrate the tariff rates. This issue would be dealt with in the following analysis, where a case for increased protection is examined, given the movement in relative prices.

6.4.3 Is there a case for raising tariff protection for cotton?

6.4.3.1 This issue would be addressed by analysing the relative movements in domestic and international prices of cotton. At the outset, it should be mentioned that the data on domestic prices for cotton are not very well organised. The exception in this regard is the availability of data on MSP.

6.4.3.2 Table 8 provides a comparative picture of domestic and international price trends observed in different categories of cotton.

6.4.3.3 The table above seems to suggest that the Indian market faces no perceptible threat from imports given that domestic prices are considerably below the international benchmark price. However, price movements observed in the National Commodity & Derivatives Exchange Limited (NCDEX), suggest that the “market price” of cotton in India is considerably higher than what the data presented above indicate. According to
NCDEX, Trading centres of Mumbai, Saurashtra region of Gujarat and Rajasthan serve as reference markets for prices of cotton traded across the country. NCDEX has reported that currently, raw cotton prices in upcountry markets across the country is ruling in the range of Rs. 41000 to 89000 per tonne for various varieties/grades (equivalent to US $ 890 to 1900). This scenario is a cause for concern for the cotton producers in India, since the average “market price” of US $ 1400 of all varieties of cotton is about 20% higher than the international prices as indicated in the Table above. This implies that the current applied rate of 10% for cotton look quite inadequate in providing protection to the domestic producers.

6.4.3.4 The issue of providing protection to Indian cotton producers needs to be considered in the light of the country’s cotton import scenario. As stated above, India was unable to meet it domestic consumption requirements until 2002-03, after which the country has started generating surpluses. However, even after 2002-03, imports have not reflected the changed demand-supply scenario in the domestic market. Although imports in the first nine months of the previous financial year have shown some signs of slackening, there is a need, to protect domestic cotton producers against import threats by providing appropriate levels of tariff protection.

6.4.3.5 This is in view of the fact that international prices of cotton have been extremely volatile during the decade. The benchmark cotton price in the international market, viz. Cotton 'A' Index, declined from nearly US $ 2200 per tonne in 1995 to under US $ 1200 per tonne in 1999. Although there was a minor reversal of this trend which saw international prices reach US $ 1400 per tonne, in the past couple of years, prices have again been on the downslide.

6.4.3.6 One of the major factors responsible for the volatility in cotton prices has been the subsidy granted by one of the largest producers of cotton, viz. the USA. The US was expected to reduce its subsidies on cotton as a part of the deal that would have incorporated the results of the negotiations in the Doha Round. An understanding reached at the end of the Hong Kong Ministerial Conference in December 2005 was that the US would reduce its subsidies in the interest of the cotton producing states in Africa, which
have suffered considerable losses in export earnings because of their inability to compete with the subsidised cotton originating in the US. However, with the Doha Round facing an impasse, the succour to the cotton producers in the developing countries that the US was expected to provide by lowering its subsidies on cotton, may not be in the offing.

6.4.3.7 In India, the issue of protecting cotton farmers raises an internal dichotomy, one that pits the interests of the farmers against those of the textile industry. While the industry has argued that the farmers have not been able to provide them their preferred long staple cotton, the farmers have argued that they can make the necessary adjustments to satisfy the requirements of the industry given the right kind of incentives. The most meaningful incentive that can be provided to the domestic producer is to protect his market from imports. The distress that the cotton farmer presently faces should be the opportune time to extend the incentive that he needs to protect his livelihood.

6.5 Oilseeds

6.5.1 According to an USDA study, India, the world’s seventh largest producer of oil crops (2001-03 average), is a major producer of soybeans, rapeseed, groundnut, cottonseed, and sunflower seed and their derived products. India is traditionally an importer of vegetable oils and an exporter of protein meals, but a negligible trader in oilseeds. Oil imports have been on the rise because of strengthening consumer demand and import liberalisation measures implemented in 1994. During 2001-03, India was the second largest edible oil importer in the world, behind the European Union (EU-25).

6.5.2 The country grows mainly nine oilseeds, viz. groundnut, rapeseed, sesame, safflower, linseed, niger seed, castor seed, soybean and sunflower. Groundnut, rapeseed/mustard account for about 60% of total production, although since the 1990s, soybean, sunflower and cottonseed have also grown in importance.

6.5.3 Production of oilseeds underwent expansion after efforts made by the oilseeds mission, which was established in the 1980s, bore fruit. Total production of oilseeds, which was only about 12 million tonnes in the later 1980s, went up to more than 20
million tonnes in 1992-93. This growth in production was largely due to higher yields, although in the 1990s, increase in the area under cultivation also played its part.

6.5.4 The growth momentum of oilseeds production seen in the early 1990s was not maintained. After reaching the lowest level in nearly a decade and a half, total production reached the highest levels ever in the two most recent years for which data are available.

6.5.5 As was indicated earlier, rapeseed and groundnut have historically contributed a lion’s share of India total oilseeds production. However, since the beginning of the 1990s, production of these two oilseeds went through considerable fluctuations with both rapeseed and groundnut production remaining depressed after 1997-98. On the other hand, soybean, sunflower seed and cottonseed production had increased. In fact, soybean had topped both rapeseed and groundnut to record the highest tonnage among all major oilseeds in 2005-06. Table 9 below provides the details.

6.5.6 The trends in oilseeds production portend to the problems that this sector faces. The inability of the major oilseeds sector to maintain its growth momentum seen in the late 1980s was manifest in the stymied domestic production of edible oils, as can be seen from Table 10 below.

6.5.7 Thus, while in the beginning of the 1990s, domestic production was seen to be matching the growing oilseeds consumption in the country, in the past few years, consumption had far outstripped production.

6.5.8 Quite clearly, the major challenge for the Indian oilseeds sector is to meet the increasing demands of its consumers. This would be possible if the production system improves its efficiency and meets the standards set by the other major oilseed producing countries.

6.5.9 India’s Oilseeds Production in the Global Context

6.5.9.1 In the following discussion, India’s production performance in the oilseeds sector is analysed by taking four of the more important oilseeds into consideration. These are rapeseed, groundnut, soybeans and sunflower seed.

6.5.9.2 Three countries, viz. China, Canada and India, dominate the global rapeseed production. China has been the largest producer of rapeseed for more than a decade and a half, followed by India. However, after the mid-1990s, India has fallen considerably behind China in terms of absolute levels of production. While the former nearly double
its production between 2002 and 2005, India was struggling to reach its peak production levels that were attained in the late 1990s.

6.5.9.3 Differences in yields essentially explain the production performance of the three leading rapeseed producers. India was able to break away from its long-term trend of 0.7 tonnes per hectare by increasing the yield to one tonne per hectare in the beginning of the 1990s. Decline in the yields in the subsequent period and the increases registered by the other major rapeseed producers meant that by 2005, yield levels in India were just one-half of that recorded by China.

6.5.9.4 In case of groundnut, the domination of China was even more marked. Between 1990 and 2004, China was able to increase its production by nearly 125%. In sharp contrast, India, which was the world’s largest producer of groundnuts in 1990, experienced a 7% decline in production during the same period. Groundnut production in India can be divided into three phases. While the 1990-98 saw an increasing trend around minor fluctuations, the four years after 1999 was one in which production levels declined by more than 50%. A recovery took place during the 2003 and 2004, but this was not enough to compensate for the earlier decline in production.

6.5.9.5 A combination of declining yields and area under cultivation affected India’s groundnut production between 1990 and 2004. Indian producers could not average more than a tonne per hectare of groundnut production during this period. At this level, India’s groundnut yield was almost a third of that registered by China. During this period, area under groundnut cultivation in India registered a 19% decline, as against an increase of more than 60% registered by China.

6.5.9.6 Among all the major oilseeds that India produces, soybean registered sustained increase between 1990 and 2004. Soybean production increased more three-fold until 2003, before a minor downturn in 2004. India’s performance is however dwarfed by those of Brazil and Argentina, both of which have been able to increase their share in the global market. Together with the USA, Brazil and Argentina, account for
80% of the total global soybeans production. India, on the other hand, continues to be only a minor player in the global context, with a production share of only 4% (2004).

6.5.9.7 As in the case of rapeseed and groundnut discussed above, Indian soybean producers have suffered in relative terms because of depressed yields. Although soybean yields have shown improvement over time, these increases have not been able to match the appreciable increases that the three leading producers have been able to register. In 2004, India’s soybean yield of 1.1 tonne per hectare was less than half of those recorded by both Argentina and Brazil.

6.5.9.8 Trends in production and consumption of oilseeds and edible oils discussed above clearly indicate that India’s oilseeds sector did not respond to the country’s growing consumption needs in the 1990s. This non-response on the part of the producers seems somewhat anomalous given the fact that production was on an upsurge following the successful intervention made by the Oilseeds Mission in the second half of the 1980s. Changes in the trade policy, in particular the liberal tariff regime that was adopted after the mid-1990s, explains this anomaly to a considerable extent.

6.5.10 Edible Oil Import Regime and its Impact on Domestic Producers

6.5.10.1 Until the early 1990s, imports of edible oils were restricted, with import duty on palm oil fixed at 125%. This regime provided higher incentives for domestic production of oilseeds, which was manifest in the higher levels of output registered by almost all the major oilseeds. When imports of edible oils were liberalised in 1994, output of oilseeds witnessed a slowdown, which had an impact on production as well as exports of oil cakes. In March 1994, imports of palm oil were put under Open General Licence (OGL) attracting an import duty of 65%, while, at the same time, state agencies like STC and National Dairy Development Board were allowed to import palm oil at a lower duty of 20%. After February 1995, this initial phase liberalisation gave way to far more sweeping changes in the import regime: all edible oils except for coconut oil were put under OGL at an import duty of 30%. And in 1998, the import duty on palm oil was reduced to 15%, the lowest level yet. This liberal import regime in oilseeds was reversed
in 1998. Import duty was initially increased to 28%, and in 2001, the duties were increased to over 90%. The changes in the palm oil import duties since the beginning of the 1990s are captured in the Table 11 below:

6.5.10.2 The variations in the import duties on palm oil affected the domestic production to a significant extent. The period of low duties on palm oil coincided with the phase when the domestic production of major oilseeds suffered a decline. Two factors influenced this decrease in import duties. The first was the effect of the overall policy regime, which, since the early 1990s, had laid more emphasis on the liberalisation of the economy. The second, and the more important, was the response of the government to encourage imports while domestic consumption of edible oils was experiencing an upswing. But after the government reposed faith in the domestic producers by increasing import protection towards the end of the 1990s, the latter also responded to this regime by increasing level of production to highest-ever levels during 2004-06.

6.5.10.3 There have been detrimental effects of the stop-go policies adopted in respect of tariff protection to palm oil, which makes for the bulk of edible oil
imports in India, on domestic edible oil production. Increase in imports acted as a disincentive for the domestic producers, which resulted in the reversal of the strong expansion that the domestic oilseeds production had started to show from the late 1980s. This experience with the oilseeds sector sends a strong message that prudence needs to be exercised while deciding on the level of protection that should be provided to critical sectors like oilseeds. Over the past decade, the country had to suffer sizeable foreign exchange outgo on import of edible oils and oilseeds because of the tariff policies. In the early 1990s, domestic production was level pegging with consumption, but import duties on oilseeds were soon slashed only to trigger a steep fall in domestic production. Even the gains of the Technology Mission on Oilseed and Pulses in increasing area and yield were lost. **This was an object lesson on the need for ensuring synergies between technology and public policy, and lesson is relevant even today.**

6.5.10.4 This issue assumes added significance in light of the recommendations made by the Committee on Rationalisation of Customs and Excise Duties on Edible Oils and Oilseeds to lower import duties on all edible oils, except soybeans to 65 per cent, from the existing 75-80 per cent. The Committee based its recommendations on the tariff adjusted import-parity prices of the major edible oils, which, according to the Committee was 24 per cent higher than the domestic prices in case of rapeseed. The data used by the Committee to arrive at this conclusion was for a one-year period, viz. December 2004 to December 2005.

6.5.10.5 **The above-mentioned recommendation of the Committee needs careful reconsideration** on at least three counts. First, the period for which the comparison between domestic and international prices was made appears too short given that agriculture is prone to cyclical behaviour. Secondly, prices of edible oils in the international market have displayed considerable volatility in the past, which is also indicated by the Committee in its report. For instance, rapeseed prices in the global markets declined by nearly 13 per cent between December 2004 and December 2005.

---

4 The Committee was set up by Department of Economic Affairs, Ministry of Finance, which was headed by Dr. Ashok Lahiri, Chief Economic Adviser to the Govt. of India. The final report was submitted in January 2006.
Lastly, domestic prices were somewhat depressed during the reference period as they were influenced by the record production of oilseeds in the country. There is substantial merit in the Note of Dissent from the Department of Agriculture and Cooperation, Govt. of India, in that continued support for oilseed sector is essential in the interest of the incomes of farmers cultivating marginal soils, and for generation of employment in rural areas, crop diversification, improved cropping intensity and restoration of soil health. All these elements are central to the efforts to reduce agrarian distress.

6.5.10.6 Government of Kerala had set up a Commission on WTO concerns on Agriculture under the Chairmanship of Prof. M. S. Swaminathan. Its report titled “Building a Sustainable Agricultural Trade Security System for Kerala”, and submitted in January 2003 has studied several commodities having global ramifications like Coconut, Black pepper, Cashew nut, plantation crops, Rubber, Tea, Coffee, Cardamom, Livestock products, Marine products and Fisheries. The recommendations made in the Report should be actively implemented.

6.6 Conclusions

6.6.1 At the outset, it must be appreciated that India has been well aware of the problems likely to be faced by the Indian farmers in the context of the globalization and the WTO commitments. The issues of access for India’s exports to the market of the developed countries, and the unfair competition faced by the Indian farmers due to the heavy subsidization of their agriculture sector by many developed countries have been central to India’s position in the negotiations under the Doha Round of the WTO.

6.6.2 Developing countries like India have focused on three main instrumentalities in any further market access commitments under the Doha Round. Firstly, consequent upon India opting for ceiling bindings in the Uruguay Round, the bound tariffs across most agricultural products are at 100% for primary products, 150% for processed products, and 300% for certain edible oils. With gradual liberalisation, the applied tariffs are generally well below bound rates, providing the Government the flexibility to calibrate the applied rate within the bound level depending upon the emerging situation. The G-20, of which India is a founder member, has proposed cuts on bound tariffs in the
Doha Round of a maximum of 36% on average for developing countries, provided that the developed countries undertake proportionately higher tariff cuts of at least 54%. Assuming G-20 cuts are agreed, at the end of the implementation period of the Doha Round in India’s case across over 80% of the agricultural tariff lines the final bound tariff would still be at or above the current applied rates. Secondly, it has already been agreed in the negotiations that developing countries shall have the flexibility to self-designate an appropriate number of agricultural tariff lines as **Special Products**. This self-designation shall be guided by indicators based on the fundamental criteria of **food security, livelihood security and rural development needs**. The tariff reductions on designated Special Products shall be more flexible than on the non-Special Products. Negotiations are underway to reach an agreement on the appropriate number of Special Products as well as the tariff reduction commitments. It would be critical for India’s farmers to ensure that as many of our agricultural commodities as possible related to rural development, food security and livelihood security are designated as special products noting that for a country like India as much as 70% of the population is linked to agriculture. Thirdly, in the negotiations under the Doha Round it has been agreed that developing countries shall have recourse to a **Special Safeguard Mechanism** which permits the application of a safeguard duty in situations of either an import volume surge or price decline of the imported product. This safeguard mechanism would be unlike the current provisions of safeguard duty or quantitative restriction under the WTO Agreement on Safeguards available to countries like India.

6.6.3 The large domestic support granted by US and EU under the three boxes to their farmers are compared with the low level of support in India, based on latest data available, as under:
Table 12: Domestic Support granted by the European Union, the United States and India

Source: IIFT, New Delhi

6.6.4 Elimination of all forms of export subsidies, which are the most trade distorting, by developed countries has already been agreed by 2013 under the Doha Round. Developing countries like India will retain the right to provide marketing and transport subsidies on export shipments for a period of 5 years beyond the end date for all forms of export subsidies by developing countries. This date is still under negotiation. On trade distorting domestic support, it has been agreed that the three heaviest subsidizers, namely, the EU, the US, and Japan, shall reduce their overall trade-distorting subsidies by progressively higher cuts in order to achieve harmonization of permitted support levels. Moreover, Blue Box subsidies will be capped and will also be subject to disciplines to ensure that Blue Box support is less trade distorting than Amber Box support. Green Box criteria will also be reviewed with a view to ensure that Green Box payments have no, or at best minimal, trade-distorting effects.
6.6.5 Regarding FTAs, India’s agricultural sensitivities have been safeguarded under the proposed India-MERCOSUR PTA even though other partners to the PTA have substantial export interest in agricultural commodities. Perhaps, this could be a model for the other FTAs under negotiations in order to ensure safeguards for Indian farmers. It would be desirable to set up a road map for FTAs with adequate domestic transparency and proceed in a sustainable and measured manner. FTAs can bring substantial benefits to Indian farmers, if safeguards are built-in.

6.6.6 Briefly, therefore trade policy gives sufficient options to protect the interests of the Indian farmers and should not become a barrier to the interests of the Indian farmers. It is for the Indian farmers to improve their productivity and enhance quality literacy with assistance from the Government to benefit from liberalization.

6.6.7 Having said this, the cases of four of agricultural commodities presented above indicate the threat that the producers engaged in each of these commodities face from imports that have been encouraged by the liberalised trading regime. Trade liberalisation has affected the domestic producer thrice over. The first was the liberalisation adopted in the early 1990s; the second followed India’s accession to the WTO, and the third is the developing interest for FTAs. Although only a few FTAs have come into effect, their impact has already been felt.

6.6.8 Liberalisation has affected several commodities, the most prominent of which are oilseeds and cotton. Increased imports have affected the fortunes of India’s oilseeds producers and at a time when their future prospects looked quite promising. Subsequently, however, increasing tariffs rectified the damage caused to domestic producers, but this change in policy was brought about only after the domestic production was put back, in some cases, by more than a decade.

6.6.9 In case of cotton, the Government has been sympathetic to the demands of the domestic textiles industry, in the interest of exports of textiles, which has unfortunately worked to the detriment of the interests of the farmers. The cotton farmers have made persistent demands to increase import tariffs, but despite universal recognition of the
distress of the farmers due, in part, to persistent imports, tariffs have remained unchanged.

6.6.10 **India’s commitments to the WTO in agriculture allow a level of comfort for the country to impose higher levels of tariffs. However, in many agricultural commodities, the advantages of high tariff bindings have not been taken.** This includes coconut, a commodity in which the country has been faced with increasing imports since the applied tariffs are inadequate to provide effective protection to the domestic producers.

6.6.11 Among the FTAs that India is currently a part of, a mention must be made of the India-Sri Lanka FTA. This FTA has had an adverse impact on the Southern States, in particular Kerala. Several commodities, including pepper and coconut, that form the lifeline of Kerala’s economy, have been affected by the duty free access provided to imports from Sri Lanka.

6.6.12 From the evidence available, a case can be made for designing trade policies that are sensitive to the needs of the domestic producers. Besides the fact that a large country like India, can ill-afford to depend on external sources to meet its requirements in a sustained manner, imports are detrimental to the interests of a considerable section of farming households. In some of the commodities mentioned above, smallholder agriculture dominates the production system. The issue of livelihood security assumes even greater importance under such circumstances.

6.6.13 The evidence should also be carefully considered by the Government, which is currently engaged in negotiating a series of FTAs. It needs to be emphasised in this context that while there may be Foreign policy and Trade policy imperatives for engaging in the FTAs, **the adversities that the farmers in India have faced during the episodes of trade liberalisation should get due consideration while decisions on the extent of participation in the FTAs are taken.**

6.6.14 In this regard, appreciative mention must be made of the uncompromising stand that India has taken in the WTO negotiations by arguing that the interests of
farmers cannot be bartered away in trade deals. The following arguments must be kept in mind:
a) Considering the strong interlinkages among the three pillars of the Agreement on Agriculture, substantial and genuine reductions in trade distorting supports in developed countries must come into force before greater market access could be considered by India. This should involve elimination of Blue Box and reform of Green Box. b) Export credits and other support subsidies, being the most trade distorting, should be phased out at the earliest. c) Livelihood support through tariffs should be seen as the only option. Since market access in developed countries is not coming through and trade continues to be distorted and unfair. d) Diversity of India’s agriculture and its huge populations dependence on agriculture as a way of life, in spite of minimal returns should be seen as enough justification for a comprehensive coverage for special products. e) Consequent to the volatile international prices and trade distortions, a comprehensive coverage for special safeguard mechanism would be fully justified, and f) The commitments in the Doha round of WTO as well as the livelihood security of 70% of our population dependent on farming need to be safeguarded.

6.6.15 This should be the reference point for all future trade negotiations. The bottom line of our Trade policies on agriculture and even our Foreign policy should be the economic well being and livelihood security of our agricultural families. It would be wasteful and counterproductive to provide assistance to farmers for increasing their production and then pursuing Trade and Foreign Policies, which end up depressing their price realisation. Simultaneous application of the accelerator and the brake can never be regarded as a good driving habit and can only lead to generation of heat and no motion and lead to a waste of fuel. It is admitted that in a global economy, the Trade and Foreign policy compulsions cannot be wished away, but then good governance is all about a skilful and balanced use of options. The distress amongst the Indian farmers growing oilseeds, cotton, pepper and coconut shows that a correction and tilt in favour of farmers is perhaps overdue. Short-term palliatives and adhoc packages may not suffice for long.

6.6.16 Even while arguing for higher subsidy support to Indian farmers to meet the threats of unfair trade in the global market, it should be simultaneously appreciated that
India does have constraints in providing high levels of support to its farmers primarily because it would involve assisting 70% of its population involved in farming by the remaining 30%. In contrast, in US, 98% of the population subsidises 2% of its population engaged in farming. Besides, US/EU have the advantage of much higher GDP as well as economic clout.

6.6.17 The Government needs to recognise that the concerns of the farmers in the era of globalisation would have to be addressed in a systematic and sustained manner. This can be possible only through the establishment of a Farmer-centred institution that would function in a network mode with the States. Towards this end, the proposal made by the National Commission on Farmers in its Third Report, Chapter 1, for setting up of an Indian Trade Organisation (ITO), dedicated to safeguard the interest of farm and fisher families by providing a Livelihood Security Box to ensure fair trade, needs to be reiterated and stressed. The Livelihood Security Box should have provisions to impose quantitative restrictions on imports and/or increases in import tariffs, under conditions where imports of certain commodities will be detrimental to the work and income security of a large number of farming families.

6.6.18 The justification for such an approach, comes from the fact that there is no level playing field between the capital, subsidy and technology driven mass agriculture production of the developed countries with a very limited number of persons engaged in agriculture and the production by masses in India with seventy percent of its population connected to farming and characterised by weak support services, deficient infrastructure, heavy debts and resource and technology constraints. This argument can find favour with a very large number of developing countries with a similar spectrum of farmers in the WTO fora. The Indian Trade Organisation should serve as “a brain and information bank” for enabling the Government to take proactive and quick reflex decisions in a timely manner on potential surpluses and shortages of agricultural commodities. ITO should have an arm to be called National/State level land use Advisory Service which could serve as a friend, philosopher and guide, to small farmers, providing proactive advice on land use and crop planning, based on best available assessment of home and external trade opportunities.
6.6.19 Briefly therefore, the small and marginal farmers in India can be protected from price fluctuations in International markets by a judicious mix of several strategies: increasing productivity by following various suggestions contained in the Reports of the NCF for achieving economies and efficiencies of scale, establishment of an Indian Trade Organisation, enhancement of domestic demand, greater attention to price, quality, consistency, reliability of supply and to trade literacy, and farmer friendly Trade and Foreign policies.

6.6.20 Mahatma Gandhi had given a Talisman for testing conflicts between Policy options, by noting, "I will give you a talisman. Whenever you are in doubt, or when the self becomes too much with you, apply the following test. Recall the face of the poorest and the weakest man [woman] whom you may have seen, and ask yourself, if the step you contemplate is going to be of any use to him [her]. Will he [she] gain anything by it? Will it restore him [her] to a control over his [her] own life and destiny? “Given the complex compulsions of globalisation, the Indian farmers need the protection of this Talisman. Their job and livelihood opportunities must be protected and inspite of constraints, such options, both in the Trade and Foreign policies and in the domestic policies relating to input prices, Minimum Support Prices and Market Intervention Operations exist and must be tapped more vigorously.

6.7 Recommendations: Way Forward

6.7.1 It is being realised that Marrakesh Agreement has given substantial benefits to the developed countries by permitting them to cover their large farm subsidies. Prof. M.S. Swaminathan has opined, “**WTO has no visible agenda for the resource-poor farming families**”. Globalisation has proved to be inherently asymmetric in its impact. Countries most dependent on export of primary commodities have not been able to derive benefits from a “free trade” regime”. It has not been fair enough. Nevertheless, globalisation and competitiveness are facts of life and the Central Government, State Government and the farmers would have to act in tandem to ensure that WTO requirement and FTAs commitments do not drag Indian agriculture and Indian farmer families down but convert challenges into opportunities. Given India’s vast plant and animal bio-diversity and varied agro-climatic conditions, Indian farmers need not go into
a defensive mode, provided the following recommendations are kept in mind by all the three players mentioned.

6.7.2 Central Government

i) While negotiating under the WTO or FTAs, for promoting India’s interest in other segments of the economy or as a part of the foreign policy, Livelihood Impact Analysis on the Indian farmers must be undertaken. Simultaneously, the impact on employment opportunities for the Indian rural youth should also be carefully studied, considering that provision of employment opportunities is a major concern and such opportunities have been shrinking due to a variety of reasons.

ii) A set of Ground Rules must be laid down which should be sacrosanct in the interest of the Indian farmers in all trade negotiations, as spelt out in Para 6.13 above. No country could object, if India attempts to protect the interest of 70% of the population which is engaged in farming as a means of livelihood and pursuing a way of life, inspite of minimal returns, while many richer countries continue to provide huge support to miniscule sections of their population, engaged in commercial farming.

iii) Rules relating to country of origin for agricultural produce must be strictly and honestly enforced so that FTAs do not become a conduit for countries not entitled for its benefits. Claims of value addition should also be carefully scrutinised. Quality of imports must also be checked very carefully.

iv) India must become a part of the process by which Sanitary and Phytosanitary Standards (SPS) are decided in order to ensure that these are not utilized as non-tariff barriers against our export to developed countries.

v) India must evolve SPS standards for our domestic produce as well as imports.

vi) Since the various boxes in the 1994 Marrakesh Trade Agreement of the WTO have been utilized by developed countries to continue to provide substantial protection to their farmers to the detriment of the farmers in developing countries, an effort should be made to do away with these boxes, earlier than
planned, or at least impose constraints on their use if developed countries do not bring down their subsidy levels substantially by a cut off date. These should be replaced by a clear statement on support which is trade distorting and which is not.

vii) Besides the effort to disband the system of Boxes, due to non-performance, a strong case for a Livelihood Security Box should be made so that assistance to farmers in developing countries for their income/employment opportunities could be safeguarded. It should be possible to distinguish between life and livelihood saving support to small farmer families and support for commodities entering the global markets.

viii) Considering that an overwhelming proportion of India’s Agricultural production goes for internal consumption in view of our large population, there is a need to set up an Indian Trade Organisation (ITO) with a National Land Use Advisory Service, as a self-empowerment measure and its own boxes for domestic support. It should advise farmers on implications of domestic regulations, WTO rules and Regional Trade Agreements. It would function as an information bank, a forum for dialogue and strategy think tank. It would also be a link between global and domestic markets. ITO has been recommended in Chapter I of the Third Report of NCF.

ix) Investments/support for more than a billion small farmers with limited access to technology, inputs, rural infrastructure and post harvest facilities should never be seen to be a barrier to free trade and trade distorting, especially when such farmers have to compete in under tapped markets in developed countries which have highly subsidized capital, inputs and technology. This argument should be forcefully articulated.

x) A Price Stabilization Fund should be established for major commodities to support farmers, when international prices fall by a certain percentage.

xi) Commodity Boards, on the pattern of Tea, Coffee and Rubber Boards should be set up for other commodities where farmers are under threat due to
globalisation/competition from highly subsidised production in developed countries. Farmers should have representation on these Boards.

xii) Since productivity and competitiveness would be the key to survival in the liberalized global market, more resources need to be provided for research and extension. Simultaneously, the personnel would need to carry out time bound farmer oriented programmes with the responsibility of working out affordable recommendations. Their success should be measured in terms of gains in productivity.

xiii) Farmers should be made more competitive through greater use of Information and Communication Technology (ICT) in order to ensure digital inclusion. This would be necessary in order to ensure “more crops per unit of input” which would provide strength to Indian farmers in global trade. The concepts and modalities of setting up Village Knowledge Centres have been elaborated and recommended in Chapter VIII of the First Report of NCF.

xiv) The use of Plant and Animal genetic resources should be optimized for developing competitiveness and tapping niche markets globally.

6.7.3 State Government

i) States must ensure convergence of resource available under programmes like NREGP, Bharat Nirman and National Rural Health Mission as well as various programmes of Department of Women and Child Development to build up infrastructure for the Indian farmers, which would enable them to increase their productivity and competitiveness.

ii) They should carry out amendments to their Agriculture Produce Marketing Acts to ensure greater transparency and provide choice to farmers for marketing their produce. It would also facilitate the participation of larger companies, who could procure for the international markets after appropriate grading/processing, and using their marketing strengths for creating a win-win situation for the farmers too.
iii) Good governance should be ensured by facilitating timely delivery of inputs and knowledge so that the farmer could avoid unnecessary and avoidable costs and delays, which affect productivity.

iv) State Land Use Board should be revitalized so that they could actively guide the farmers to the demands of the international market by correlating data on soil, weather, market prices and market demand. The Board should have a technical and multi-disciplinary team with participation of the farmers and should provide recommendations, which would be ecologically sustainable and affordable.

v) There should be active coordination between the State extension machinery/ATMA and Krishi Vigyan Kendras so that proper synergies could be built up and farmers could take up knowledge-based agriculture.

vi) State should facilitate a Consortium of progressive and innovative farmers for encouraging other farmers to take up novel practices and projects for enhancing incomes in a sustainable manner. It would be desirable to involve farmers whose products have been successfully exported in this Consortium so that concepts of quality, trade and legal literacy could also be propagated.

6.7.4 Farmers

i) Increase in the productivity and competitiveness, especially of the small and marginal farmers, would be the cornerstones of the farmers’ efforts to gain from globalization. Given the fact that the bulk of the holdings are operated by small and marginal farmers and most of the cropped area is rainfed which is subject to vagaries of weather and facing barriers to technology upgradation, the task is difficult but certainly achievable through steps like the organisation of Small Farmers’ Estates.

ii) Various measures to increase competitiveness have been elaborated and recommended in Chapter III of the Fifth Report and other Reports of NCF and cover issues like Investments inputs, technology, knowledge revolution soil health and move towards high value agriculture, marketing, post harvest
operations and value addition etc. The farmers would have to pay attention to all these strategies not only to climb up the ladder of competitiveness but also to stay above others. It should be remembered that competitive advantage is a dynamic concept and many internal and external factors can upset balances.
CHAPTER 7

SHAPING THE ECONOMIC DESTINY OF FARMERS

7.1 Indian agriculture is characterized by the following distinctive features, as per the data collected under the 59th Round of NSSO (Report No. 497) as well as other studies:

- Over 60% of the population depends on crop and animal husbandry, inland and marine fisheries, forestry and agro-processing for their livelihood.

- Over 60% of the consumers are farm families and the prevailing widespread malnutrition can be eliminated only by improving their income and purchasing power.

- Farming is the largest private sector enterprise in the country; State-wise information shows that the lowest percentage of farm households, out of total rural households is 35% in Tamil Nadu. The highest at 91% is in Jammu and Kashmir.

- Out of 115 million holdings, 90 million are 1 hectare or less in size. Tiny holdings limit the capacity of farmers to take to the technological upgrading of farm enterprises. They also limit their coping capacity to withstand economic shocks caused by meteorological and/or marketing policies.

- Out of 178.25 million farmers, 136.85 million (76.7%) are foodgrain farmers. 13 million farmers produce cotton and sugarcane.

- Rural poverty and under-nutrition are higher than urban poverty and hunger.

- There is increasing feminisation of agriculture. Women constitute over 50% of the agricultural work force. Yet, women have no land rights and are push-outs of the credit system.
• Rural infrastructure is poor, particularly in the area of post harvest technology. There is a mismatch between production and post-harvest technologies in most farming systems.

• Capital formation in agriculture is going down and the credit-deposit ratio is adverse in rural branches.

• The principle of financial inclusion is yet to become a reality in rural India.

• Prime farm land is being diverted for non-farm purposes, due to the lack of an agricultural land conservation policy; consequently more food and other agricultural products will have to be produced under conditions of diminishing per capita availability of arable land and irrigation water.

• The rate of growth of employment in rural areas is poor, leading to the population supporting capacity of the ecosystems being exceeded in most parts of the country and to the unplanned migration of the rural poor to urban slums.

• The average monthly income per farmer household is Rs.2115 and does not cover the average per capita monthly consumption expenditure of Rs. 2770. Only households with landholding of 4 ha and above have a surplus of income over expenditure.

• The cost-risk-return structure of farming is getting adverse leading to a sense of despair in the rural areas. Consequently, the youth in villages are reluctant to take to farming as a career.

• The ecological foundations essential for sustainable agriculture like land, water, forests and biodiversity are in varying degrees of decay and adverse changes in climate appear a distinct possibility as a result of global warming.

• In the prevailing atmosphere of gloom and doom, there are many bright spots – farmers with access to adequate land, water, capital and technology are doing very well in areas like horticulture and animal husbandry and are demonstrating the strengths of Indian agriculture, arising from abundant sunshine and a rich diversity of agro-ecological and agro-climatic conditions.
The persistence of widespread under- and malnutrition in the country arises from policies which fail to recognize that the farming population including landless agricultural labour constitute the majority of consumers. Unfortunately, the term, “Consumer” seems to cover only the urban population in the minds of the policy makers. This is one of the reasons why we are off-track in achieving the UN Millennium Development Goal of reducing hunger by half by 2015. **Enhancing small farm productivity and profitability, as a single step, will make a major contribution to reducing hunger and poverty. This in turn will depend on our ability to assure remunerative prices for their produce.**

In industrialized countries, farmers constitute 2 to 4 percent of the population. The per capita income of farmers is high both because of the size of the farm operated and the extensive support extended by government. They are technology, capital and subsidy rich. Public policies concurrently promote conservation, cultivation, consumption and commerce. Extensive support is given to promote conservation farming. **The collapse of the Doha round of negotiations in agriculture is an indication that farming cannot survive in industrialized countries without substantial support from public funds to ensure its economic viability.**

What then is the future for India’s rural population numbering over 700 million? **We cannot be silent onlookers to a situation where 30% of India is shining and 70% is weeping.** If we want farmers and farming to survive, several essential steps should be taken immediately. In addition to the areas mentioned in the first four Reports of NCF and in the draft National Policy for Farmers, the following four areas needs urgent and integrated attention: technology, training, techno-infrastructure and trade. Technological, ecological and management upgradation of small farms is the need of the hour.

**Technology**

Technologies which can help to enhance land, water and labour productivity are urgently needed. They should lead to an evergreen revolution in small farms, i.e. increase in productivity in perpetuity without associated ecological harm. The smaller
the farm, the greater is the need for marketable surplus in order to generate cash income. The small farm can lend itself to higher productivity and profitability, provided the small farmer is enabled to overcome his/her handicaps arising from lack of capital and credit and access to appropriate technologies and inputs and remunerative markets. There is need for a small farm management revolution, which can result in conferring the power and economy of scale on small producers both in the production and post-harvest phases of farming; if this does not happen, mounting debts arising from adverse economics will continue to affect them. The strategy for a Small Farm Management Revolution will have to be developed by Panchayati Raj Institutions (PRIs) with technical help from Agricultural, Rural and Women’s Universities as well as IITs and IIMs, since much of the action will be location-specific. Cooperative farming, service cooperatives, stakeholder companies, formation of compact production and processing Estates by Self-Help Groups and farmer centric contract farming can all help to improve the economics of small holdings and thereby foster improved management. The pace of the implementation of the Wasteland Development Programme is slow. The recommendations of the Mohan Dharia Committee on Wasteland Development are yet to be adopted in a serious manner.

7.5.2 At the production end, there is need for integrating frontier technologies like biotechnology, information and communication technologies, space and nuclear technologies and renewable energy technologies such as solar, wind, biogas and biomass based energy systems with traditional ecological prudence. Bio-energy based on pyrolysis and gasification of biomass can be a decentralized source of energy. Bio-fuels also offer scope wherever ecological and economic conditions are favourable. Biomass is an under-utilized resource. Bio-Parks can be promoted in every block to convert the available biomass into a wide range of economic products, including energy and manure.

7.5.2 Conservation farming is the pathway to an evergreen revolution. The greatest problem with applying conservation agriculture concepts in dry land areas is the lack of adequate quantities of crop residues. The removal of crop residues for alternative uses accelerates the already fast decline of soil organic matter content in dry land areas.
Long term sustainability of dry land soils may be significantly enhanced by reduced tillage that leaves more crop residues on the soil surface.

7.5.3 Besides enhancing soil fertility and soil organic matter, the need for the economic and efficient use of irrigation water cannot be over emphasised. The average yield of cereals can be increased by 30 to 60% annually in dry farming areas by increasing crop water use by 25 to 35 mm. This can be readily achieved by conservation agriculture. High input costs, uncertain rainfall and poor income lead to widespread indebtedness. The younger generation will be reluctant to take up farming as long as income prospects are poor. Declining terms of trade between farm and non-farm sections is a matter of concern.

7.5.4 It is in this background, that we have to examine the opportunities opened up by new technologies. New agriculture technologies like genomics and information technology together with improved agronomic management should form the cornerstone of increasing agriculture productivity and profitability of small farms both in irrigated and rainfed areas as well as in problem soils and coastal areas. Recombinant DNA technology has already resulted in the breeding of crop varieties possessing tolerance to salinity and drought as well as to serious biotic stresses caused by the triple alliance of pests, pathogens and weeds. It is however essential to have a professionally and socially credible National Biotechnology Regulatory Authority, on the lines recommended by the Swaminathan Committee in 2004. The bottom line for any biotechnology regulatory policy should be the safety of the environment, the well being of farming families, the ecological and economic sustainability of farming systems, the health and nutrition security of consumers, safeguarding of home and external trade, and the biosecurity of the nation.

7.5.5 The Village Knowledge Centre (VKC) or Gyan Chaupal movement recommended by NCF in its first report (December 2004), will help to bridge the growing gap between scientific knowledge and its field application. It will also facilitate the removal of many intermediaries from the marketing chain.
7.5.6 The wholesale fruit and vegetable markets are likely to lose their importance under the growing influence of contract farming and direct supply relationships between producers and major market chains. Changes in intermediary relationship will occur as internet based marketing tools are adopted by both producers and suppliers. **Bharat Nirman has rightly given priority to knowledge connectivity, in addition to physical connectivity through roads.** As a single step, the *Gyan Chaupal* will bring about a transformation in the economic conditions and social relations in our villages. **Bridging the digital divide is a powerful method of bridging the gender divide, since rural women master the ICT technologies with ease.**

7.5.7 India is poised for a major ICT revolution in rural India. The broad strategy recommended by NCF is as follows:

- Establishment of a Village Resource Centre (VRC) in every block with the help of the Indian Space Research Organisation. These VRCs will be linked to satellites and will have telecommunication facilities.

- Every Panchayat headquarter will have a Gyan Chaupal or Village Knowledge Centre (VKC). This will have internet connectivity. Alternatively, the Gyan Chaupal can be established in the village school or any other public space where there will be social inclusion in access to the technology.

- The last mile and last person connectivity will be through FM / Community radio and / or mobile phones. **The internet – radio – mobile phone synergy is a very powerful tool for social inclusion in access to all the needed information, including warning of impending natural disasters.** Villagers give priority to health and marketing information. In addition, an Entitlements Database can empower them with information on all the Government schemes designed for their well being. Gender-specific information is equally important. Every farmer in the village should be issued with an Entitlements Pass Book.

7.5.8 NCF is happy that the Government of India has approved the setting up of 100,000 rural Common Services Centres (CSC) across the country at a total cost of
Rs.5742 crores. This will help to accelerate progress in achieving the goal of Every Village a Knowledge Centre. The Village Level Entrepreneur (VLE) envisaged under the programme should be supported by a capacity building programme. The Fellows of the Jamsetji Tata National Virtual Academy may be able to organize such capacity building and mentoring programmes. *The Rural Knowledge Revolution is now on the way to becoming a reality.*

7.5.9 We are thus on the threshold of both a biotechnology and information technology revolution. Biotechnology does not imply only GMOs. Non GMO applications are many, such as tissue culture for multiply elite germplasm, bio-fertilizers, bio-pesticides and bio-remediation of ground water as well as marker-assisted breeding. In the case of GMOs, safe and responsible use should be ensured. Organic farming procedures permit the use of varieties developed by marker-assisted breeding.

7.5.10 The third technological revolution relevant to agriculture is the ecotechnology movement. This involves the appropriate integration of frontier sciences with the ecological prudence of farming communities.

7.5.11 The ecotechnology revolution underpinning the ever-green revolution movement has many pathways as indicated below.

| Green Revolution: Commodity-centred increase in productivity | Ever-green Revolution: increasing productivity in perpetuity without associated ecological harm |
| Change in plant architecture, and harvest index | Organic Agriculture: cultivation without any use of chemical inputs like mineral fertilizers and chemical pesticides |
| Change in the physiological rhythm-insensitive to photoperiodism | Green Agriculture: cultivation with the help of integrated pest management, integrated nutrient supply and integrated natural resource management systems |
| | Ecoagriculture: based on conservation of soil, water and biodiversity and the application of traditional knowledge and ecological prudence |
| | EM Agriculture: system of farming using effective microorganisms (EM) |
| | White Agriculture: system of agriculture based on substantial use of microorganisms, particularly fungi |
| | One-straw Revolution: system of natural farming without ploughing, chemical fertilizers, weeding and chemical pesticides and herbicides |
For most small farmers, green agriculture will be the most feasible form of eco-agriculture. Crop-Livestock integrated systems of production will be ideal for organic farming. More research is needed on nitrogen fixing tree species and shrubs, as well as green manure plants. Our soils are hungry and thirsty and they need both nutrients and water.

In addition to BT, ICT and Ecotechnology, there are opportunities in space application, nuclear techniques and GIS and GPS based precision farming. What is important is the training of Farm Science Managers (atleast 1 woman and 1 man) in every village, so that there is a new dawn in Indian agriculture, which capitalizes on both traditional wisdom and frontier science and technology.

In their 2004 report on “Revamping and Refocusing Agricultural Research” the Swaminathan Committee stressed the need for greater investments in strategic research. Fortunately, the Finance Minister responded positively and provided Rs. 50 crores for this purpose in the Union Budget for 2005-06. This should be activated and used for purposes like the preparation of Bio-bricks through the science of synthetic biology. Also, like the Silicon Valley, Biovalleys could be organized in Western and Eastern Ghats and the Himalayas, to run training programmes combining conservation and sustainable use to enable the local population to convert biodiversity into bio-wealth.

We can then end the irony of the co-existence of prosperity of nature and poverty of people. Organic farming also requires support from strategic research in the areas of feeding for high yields and pest management. An area of technology of great importance to the survival of small scale agriculture is proactive advice on land use based on anticipated meteorological and marketing conditions. A Land Use Advisory Service, using the latest meteorological and computational tools is badly needed. We cannot abandon farm families with small holdings to their fate in a globalized economy without adequate support services based on the best in modern science. A Market Intelligence Service should be set up which can monitor crop trends in the country and advise farmers what to plant in the coming season, so as to prevent gluts and price crashes. This can be disseminated through the Village Knowledge Centre.
7.6 Training

7.6.1 How can such a technological, ecological and managerial upgrading of small farm agriculture be brought about? This is where training, re-training, re-tooling and redeployment of both farmers and farm graduates become important. Fortunately, we have 47 Agricultural and Animal Husbandry (including Fisheries) Universities. Nearly 20,000 farm graduates including about 7000 postgraduates become available each year. There is a vast chain of National Research Institutes and Centres, National Bureaus and All India Coordinated Projects under ICAR. There are also a growing number of R & D institutions in the private sector and a number of civil society organisations working on agricultural issues. The Indian National Agricultural Research System (NARS) is thus a formidable one.

7.6.2 NCF has already recommended the following steps:

- Promote farmer to farmer learning by establishing Farm Schools in the fields of outstanding farmer-achievers.
- Revitalize and upgrade Krishi Vigyan Kendras by adding a post-harvest technology wing.
- Organise 60,000 Lab to Land demonstrations in the areas of post-harvest processing, marketing and value addition to primary produce all over the country.
- Establish Gyan Chaupals in every village based on the integrated use of the internet, cable TV, community radio, cell phone and local language community newspapers. If Mission 2007: Every Village a Knowledge Centre is accomplished, the knowledge deficit currently prevailing in villages can be removed and the “know-how” – “do how” gap can be bridged.
- Establish Capacity Building Centres for those operating Gyan Chaupals.
- Train one woman and one male member of every Panchayat as Farm Science Managers
• Establish at the District level a SHG Training and Mentoring Centre, in order to build a local level cadre of SHG catalysts, capable of organizing Sustainable Livelihood Banks based on micro-credit.

• Establish in coastal areas Fish for All Training Centres to provide training in all aspects of fisheries ranging from capture/culture to consumption.

7.6.3 Training of farm and home science graduates also needs revamping. NCF has proposed that the major mission of our Agricultural, Veterinary, Fisheries, Rural and Women’s Universities should be to help every scholar to become an entrepreneur. They can then organize Service Co-operatives, Stakeholder companies, Agri-clinics, Agri-business centres, Bio-Parks, Food-Parks and other enterprises which can help to improve the efficiency and economics of farming. Home Science Colleges could be restructured as College of Human Sciences, where both men and women learn the science and art of nutrition, agro-processing and home economics. This is why NCF has included farm and home science graduates in the definition of farmers. They should be proud to belong to the dominant vocation of India, namely farming and farm-based enterprises. The cover of this last report of NCF has an extract from the Visitors’ Book of the National Dairy Research Institute, Bangalore, showing that the father of the Nation Mahatma Gandhi chose to describe himself a “Farmer”. Only youth can revive the glory of Indian farming.

7.6.4 Service cooperatives by farm and home science graduates can help to upgrade speedily the efficiency and economic viability of small farms, since they can facilitate highly productive decentralized production supported by key centralized services. Cooperatives should be organized on a stakeholder rather than on a shareholder principle.

7.6.5 A reorientation in the mindset of farm graduates can be brought about only by innovative changes in curricula and courses. In all applied areas, business and financial management should be added to the disciplinary training. For example, a course in Seed Technology can be restructured and designated as “Seed Technology and Business”. Similarly, nutrition courses could be reorganized as Food Safety and Nutrition Security programmes. Courses in Agronomy could be developed
into Agronomy and Agri-business Programmes. **If the business, financial and trade aspects are integrated with disciplinary training, such courses will give the farm/home science graduates the self-confidence essential for embarking upon a career of self-employment.** We recommend that attention be given to imparting a business orientation to all the applied courses in Agricultural Universities. A large number of graduates are now being trained in the field of biotechnology. However, many of them are not able to utilize their training after taking degrees due to lack of appropriate employment opportunities. Agricultural Biotechnology is an area where there are considerable opportunities for remunerative self-employment. It would therefore be appropriate that support is extended to the creation of a **National Association of Genome Entrepreneurs** who could be supported with Venture Capital Fund in order to enable them to convert the rich knowledge available in Government institutions in the field of functional genomics into commercially viable products. They could also undertake work for other countries in the area of preparation of genome maps of the crops of interest to those countries. The National Centre for Plant Genome Research set up by the Department of Biotechnology at New Delhi could organize short term course on Functional Genomics and Business Development. **Mainstreaming entrepreneurship and business skills in all applied courses, rather than keeping Business Management Course as a separate entity is essential, if small farm agriculture is to become economically sustainable and educated youth are to be attracted to take to a career in agriculture.**

**7.6.6 Another urgent need is the establishment of a chain of Regional Institutes for Food Safety and Security.** They can be established in appropriate Agricultural, Veterinary or Fisheries Universities. To begin with seven such Centres may be established during the 11th Plan period. Home Science Graduates can be employed in such Regional Institutes to launch a movement for food safety including awareness of codex alimentarius standards. They should also spread quality literacy among farmers through Gyan Chaupals.

**7.6.7 Training of all engaged in agricultural administration in the basic principles and economics of farming is essential.** In the United States, practising farmers often
occupy leading positions in Agricultural Departments for specific periods. It would be useful to begin posting active and accomplished farm/fisher women and men as Directors in State Departments of Agriculture, Horticulture, Animal Husbandry, Fisheries, etc on a 5 year tenure. Unless there is an upgradation in the practical knowledge of those responsible for developing agricultural programmes and policies, there is no hope for Indian agriculture in a globalised economy.

7.6.8 The other urgent task is to sensitize the policy maker on the ground realities of farm economics. We suggest that the Sixth Pay Commission may be requested to familiarize itself with the “net take home income” of farm men and women who constitute the genuine majority of our population. A comparative study of the positions of the salaried class and of the self-employed farmers working in sun and rain to feed the small elite salaried class, is in the broader interest of the Nation, particularly in the context of a commitment to inclusive growth. Understanding the economics of farming will help the Sixth Pay Commission to appreciate the social context in which the salaries and privileges of a small section of the population need to be fixed.

7.7 Techno-infrastructure

7.7.1 Bharat Nirman should help to improve the infrastructure essential for a technological upgrading of farm operations. Post-harvest infrastructure, particularly for perishable commodities, is extremely weak. This is why the Swaminathan Committee recommended in 1981 the establishment of a National Horticulture Development Board, solely devoted to the cause of improving post-harvest infrastructure, processing and marketing. Unless this is attended to on an urgent basis, farmers will not be able to get adequate return for their labour. Fortunately, the National Horticulture Mission is likely to fill this felt need. Similarly facilities for food safety, water quality, sanitary and phytosanitary measures and biosecurity need to be improved. The Small Farmers’ Agri-business Consortium (SFAC) started by Prime Minister Dr Manmohan Singh, in 1992, when he was Union Finance Minister, is yet to serve the purpose of enabling small farmers to take to market driven agri-business. It is high time that SFAC is restructured,
revitalized and financially strengthened as indicated by the Union Finance Minister in his budget speech in 2004.

7.7.2 Credit at the right time and in adequate amount is a basic requirement of small farm families. In keeping with its commitment to inclusive growth, the Government of India is promoting Financial Inclusion (FI) in respect of access to credit. The RBI Policy Statement for 2006-07 has asked SLBC in all States / UTs to identify atleast one district in their area for achieving 100% financial inclusion, by providing a “no frills” account and a General Purpose Credit Card (GCC). Some of the other considerations which need to be kept in view are the following:

- Expand and strengthen the Bank-MFI-SHG route with support services for capacity building and training
- Launch a massive campaign of financial literacy in the local language
- Open Farmers’ Counselling Centres at taluka level. Bank of India is already doing this at the district level in Wardha
- Take an integrated credit requirement approach and combine investment, production and consumption requirements
- Examine and replicate innovative schemes already in operation like the Kalinga Kisan Gold and Silver Card Schemes launched by the Orissa State Cooperative Bank and the financing of tenant farmers cultivating land on “oral lease basis” in Andhra Pradesh through Rythu Mitra scheme, to address the genuine credit needs of farmers
- Devise innovative insurance schemes, both credit card linked and otherwise to cover crop, animal life, human life, healthcare
- Link with Government departments at the district level to ensure integrated delivery of schemes to the people.

7.7.3 Facilities for soil testing, particularly estimation of micro-nutrient status also need considerable strengthening. Unless more investment is made in strengthening
the support services needed by farmers for the scientific upgradation of farming, the average productivity will continue to remain low and youth will not be attracted to farming. Simple but safe storage bins need to be popularized on a large scale, along with low cost refrigeration facilities for perishable commodities. As recommended in the earlier Reports of NCF, a Livestock Feed and Fodder Corporation, a Land Use Advisory Service, an Indian Trade Organisation, Living Heritage Gene Banks to conserve unique local breeds of farm animals, internationally recognized certification agencies for organic farm products, an Agricultural Price Stabilisation Fund, integrated insurance products like Parivar Bima Policy and other essential support services are needed to help increase the productivity and profitability of small farm agriculture. The National Fisheries Development Board and the National Rainfed Area Authority recommended by NCF have fortunately come into existence. It is essential that such bodies should serve as professional powerhouses in their respective fields and help to upgrade the technological, ecological and management aspects of culture and capture fisheries on the one hand, and rainwater harvesting, conservation, sustainable use, aquifer recharge, more crop and income per drop of water and other issues relating to achieving the goal of Jal Swaraj in rainfed agriculture, on the other.

7.8 Trade

7.8.1 Producer oriented market holds the key to remunerative and sustainable farming. Quality and trade literacy should receive high priority in Gyan Chaupals. Facilities for Farmers’ Markets need to be expanded rapidly. In commodities essential for maintaining the Public Distribution System, the procurement price should be the market price at the time of purchase. Those providing essential commodities for the PDS should be recognized through the provision of Smart Cards, which will entitle them to certain benefits while purchasing essential farm inputs, including agricultural implements and machinery.

7.8.2 The wheat import plan announced by the Government of India during 2006 is in response to the need for maintaining adequate food stocks both for the purpose of food security and for feeding the public distribution system. Following the Wheat Revolution
in 1968, Smt Indira Gandhi decided to build a sufficient buffer stock of foodgrains under Government control in order to ensure that the basic staples are available at reasonable prices even under conditions of unfavourable monsoon. **She was also deeply conscious of the linkage between food security and national sovereignty in foreign policy and hence had decided that the Government should remain at the commanding height of the food security system.** Maintaining adequate food reserves is an absolute must from the point of view of avoiding both panic purchase and man-made famines, particularly at times when there are indications of aberrant monsoon behaviour. A few years ago, the Government of India had over 60 million tonnes of foodgrain reserves and substantial quantities were exported to reduce the cost of maintaining stocks of that order. There was criticism at that time that while we are exporting foodgrains, millions of children, women and men go to bed partially hungry in our country. The situation was described in the media as “grain mountains and hungry millions”. Even now we have the largest number of malnourished children in the world. Only the grain mountains have disappeared.

7.8.3 Wheat imports have now become essential to build and maintain a buffer stock and maintain prices at a reasonable level. Normally much of the surplus grain is bought by Government Agencies like the Food Corporation of India and State Corporations at the support price announced by Government. During 2006, private parties including large corporations have also entered the grain market and have been able to procure a part of the surplus grains at a slightly higher price than that offered by Government. The farmers are certainly happy when they are able to get higher prices. However this situation has led to a shortfall in procurement target necessitating wheat imports.

7.8.4 Maintaining food security for our over 110 crores of people is a fundamental obligation of Government. Fortunately, we have sufficient foreign exchange reserves and hence imports can be resorted to where there is no other alternative to replenish the buffer stock and operate the PDS. What is important is to draw appropriate lessons from this year’s experience and undertake the development of a long term policy for home grown food based food security, where both the public and private sectors perform well defined and mutually reinforcing roles. Such a strategy should be designed to promote the
availability of the staple grains and food commodities needed for nutrition security at the right time and place as well as at an affordable price. The private sector should develop its own code of conduct and should not indulge in actions where for short term financial gains, the health and nutritional security of millions of children, women and men are sacrificed. There is need for a transparent and well defined code of conduct in the areas related to the purchase and trade of basic staples. Speculative trading should be prevented. The nation as a whole must take pride in an effective food security system.

7.8.5 There have also been adverse comments on the removal of 10% tariff imposed on the import of pulses. In our country the situation with reference to producers and consumers is different from those of the industrialised nations. Nearly 65% of the consumers in India are also producers, many of them operating farms of 1 ha. and below in size. Rural malnutrition is more widespread than urban malnutrition. Small farm families depend for their livelihood on income from the sale of whatever surplus quantities of foodgrains, vegetables, fruits and milk they may have for the market. Pulses and oilseeds are predominant crops of rainfed and dry farming areas. Productivity is low since efforts in spreading new technologies and seeds are poor or inadequate, although there is a huge stockpile of underutilized technologies including new varieties. If we continue the practice of importing large quantities of pulses and oil seeds, without determined action to produce them within the country, dry farming areas will continue to languish in poverty and malnutrition. The linkages between low small farm productivity and the persistence of poverty and malnutrition is very strong. Therefore, the sooner we revise our import policies in relation to pulses and oil seeds and divert our attention to helping the millions of farmers toiling in rainfed areas to produce more of these essential commodities by assuring them of a support price, the greater will be the possibility of reducing substantially hunger and poverty in the country. Whenever there is a good crop of pulses or oilseeds like the one in mustard this year, farmers suffer due to lack of assured and remunerative marketing opportunities. The interests of the producer-consumer needs greater protection than those of the interests of trader-importers. Prime Minister Rajiv Gandhi started the Oilseeds and Pulses Missions to give holistic attention to all links in the production-consumption chain. The Missions
also had a striking impact in their early years. Subsequent policy changes and leadership vacuum have unfortunately led to the stagnation in the productivity of these life enriching crops.

7.8.6 The twin goals of ensuring justice to farmers in terms of a remunerative price for their produce, and to consumers in terms of a fair and affordable price for staples (65% of consumers are also farmers) can be achieved through the following integrated strategy:

- MSP should be regarded as the bottom line for procurement both by Government and private traders. Purchase by Government should be MSP plus cost escalation since the announcement of MSP. This will be reflected in the prevailing market price. Government should procure the staple grains needed for PDS at the same price private traders are willing to pay to farmers. Thus the procurement price will be higher than the MSP and will reflect market conditions. The aim of Government purchase is to feed the PDS, while the goal of the private trade will obviously be for making a large profit when the prices go up a few months after harvest. Thus, Government purchases foodgrains for public good, while private traders purchase for commercial profit. By purchasing at prevailing market rate, Government ensures that both farm families and urban consumers get a fair deal. At the same time, opportunities for the private trade to buy and store large quantities of staple grains and sell them when the prices go up substantially can be curtailed. In other words, if the market price of wheat is Rs. 800 per quintal soon after harvest, Government should give farmers that price for the quantities needed for PDS and buffer stocks. Trade will offer a little higher price than Government, in order to sell the produce when the price goes up, say to Rs. 1500 per quintal after a few months.

- The food security basket should be widened to include the crops of the dry farming areas like bajra, jowar, ragi, minor millets and pulses. PDS should include these nutritious cereals and pulses purchased at a reasonable MSP.
This will be a win-win situation both for the dryland farmer and the consumer. 

**We will witness neither a second green revolution, nor much progress in dryland farming, unless farmers get assured and remunerative prices for their produce.** A nutritional literacy programme also needs to be launched through Gyan Chaupals in conjunction with PDS.

- Food security with home grown foodgrains can alone eradicate widespread rural poverty and malnutrition, since farming is the backbone of the livelihood security system in rural India. This will enable **Government to remain at the commanding height of the national food security system.** Building a food security system and containing price rise with imported foodgrains may sometimes be a short term necessity, but will be a long term disaster to our farmers and farming. **A well-defined, pro-farmer and pro-resource poor consumer Food Security Policy is an urgent necessity.**

- Both universal PDS and enforcing MSP throughout the country for the selected crops are essential for imparting dynamism to agriculture.

7.8.7 **The Commission on Agricultural Costs and Prices (CACP) should be an autonomous statutory organization with its primary mandate being the recommendation of remunerative prices for the principal agricultural commodities of both dry-farming and irrigated areas.** The Minimum Support Price (MSP) should be atleast 50% more than the weighted average cost of production. The “net take home income” of farmers should be comparable to those of civil servants. **CACP should become an important policy instrument for safeguarding the survival of farmers and farming.** Suggestions for crop diversification should be preceded by assured market linkages. **The membership of CACP should include a few practicing farm men and women.** The terms of reference and status of CACP need review and appropriate revision.

7.8.8 Credit and insurance are twin basic needs of farmers. Farmers’ Associations feel that either NABARD should be renamed as **National Bank for Farmers** in order to enable it to focus attention on farmers rather than only on farming or else a new Bank for Farmers may be set up. Obviously, there is need to look at this issue carefully.
To sum up, imports or exports of foodgrains may be necessary from time to time, but the **bottom line of our import-export policies must be the livelihood security of both the farm and non-farm populations of rural India who constitute 70% of our population.** Time has come for Government to set up a multistakeholder **National Food Security and Sovereignty Board** chaired by the Prime Minister with its membership including the Minister for Agriculture and Food and other concerned Ministers of GoI as well as a few Chief Ministers of food surplus and deficit States, leaders of all national political parties, a few experts including specialists in the gender dimension of agriculture and food security, and mass media representatives. We are confronted with the need to safeguard the food security requirements of both resource poor farmers and resource poor consumers. The bulk of such resource poor farmers are small or marginal farmers and landless agricultural labour in unirrigated areas. It is these linkages which need to be understood and attended to. The proposed National Food Security and Sovereignty Board can attend to these complex linkages in a holistic manner and develop and implement a transparent national food security policy in the interests of all regions of the country and all sections of our population.

**7.9 Shaping our Agricultural Future – A three pronged Strategy:**

**7.9.1** India will remain during most of the 21st century a predominantly agricultural country, particularly with reference to livelihood opportunities. Therefore there is need for both vision and appropriate action in the area of shaping our agricultural destiny. Our major agricultural strengths are our large population of hard working farm women and men, our varied climatic and soil resources, abundant sunshine throughout the year, reasonable rainfall and water resources, a long coast line and rich agro-biodiversity. Converting them into jobs and income is the challenge.

**7.9.2** In our view, we should look upon agriculture not just as a food producing machine for the urban population, but as the major source of skilled and remunerative employment and global outsourcing hub.
7.9.3 Just as IT industries have specialized in handling outsourcing assignments efficiently, we must enable our farm graduates and farmers to take up outsourcing jobs, in areas where we have a comparative advantage. Some examples are hybrid seed production, tissue culture propagated plants, organic farm products, biological software for sustainable agriculture like biopesticides, biofertilizers, pheremones as well as herbal products, fruits, flowers and vegetables, vaccines and sero-diagnostics and veterinary pharmaceuticals based on medicinal plants. There is also scope for becoming a global outsourcing hub in the areas of plant and animal genomics and ICT for rural poor. Farm, Veterinary, Fisheries and Home Science Graduates should be trained to become genome and digital entrepreneurs. To start with, a few of our Agricultural, Animal Sciences and Fisheries Universities could set up **Bureaus for Outsourcing Business in Agriculture** to facilitate contacts between farmers’ organizations as well as agri-business centers operated by farm and home science graduates and external agri-business enterprises. Outsourcing should not only be from other countries to urban India, but also from urban to rural India, so that educated youth continue to live in villages.

7.9.4 We need a new vision for agriculture. That vision should aim to spread happiness among farm and rural families. **Bio-happiness through the conversion of our bio-resources into wealth meaningful to our rural families should be the goal of our national policy for farmers.** The hidden and unrecognized opportunities for creating more skilled jobs and income in the farm and non-farm sectors need to be tapped through appropriate public policies and programmes. Technology Missions should be revamped and revitalized on the lines envisaged by Bharat Ratna Rajiv Gandhi when he first proposed them as organizational and management tools to help the nation leapfrog in the production of essential commodities like oilseeds and pulses.

7.9.5 A structurally progressive economy should reduce the share of people dependent on a sector as the share of that sector falls in the GDP. As the share of agriculture in the GDP falls, the share of people dependent on agriculture is also expected to fall in the same proportion. However in the Indian Economy though the share of agriculture in the GDP is falling steadily, there is no corresponding decline in the share of population dependent on agriculture. Because of population growth, the absolute number
of people depending on agriculture is increasing, even if there is a decline in percentage terms. This is why NCF has recommended a major integrated Rural Non-farm Livelihood Initiative, so that both on-farm and non-farm livelihoods become skilled and profitable.

7.9.6 The Technology strategy for an evergreen revolution should have the following three components:

**Defending the Gains**

7.9.6.1 Punjab farmers provide 60% of wheat and 40% of rice to the PDS and national buffer stocks. The net productivity has increased in the Punjab in rice and wheat from 1.2 t/ha and 1.1 t/ha to 4.3 t/ha and 3.9 t/ha respectively from 1960-61 to 2004-05. However, in recent years there is stagnation in productivity improvement due to a variety of causes of which the following are important:

- Declining farm size and income
- Depleting natural resources base, as for example a steep fall in ground water table and impaired water quality.
- Increasing input costs, particularly diesel and adverse economics of farming
- Deficiency of micro-nutrients in the soil and deteriorating soil health
- Inadequate post harvest technology
- Uncertain market prospects except for wheat and rice though MSP is announced for the following 25 agricultural commodities:
  - Cereals – paddy, rice, wheat, jowar, bajra, maize, ragi, barley
  - Pulses – gram, tur, moong, urad, masur
  - Oilseeds – groundnut, soyabean (yellow/black), rapeseed and mustard, toria, sunflower seed, safflower, nigerseed
  - Sugarcane, cotton, jute, tobacco
- High indebtedness of farmers – the total debt of Punjab farmers for instance is estimated to be about Rs. 24,000 crores.

7.9.6.2 Similar conditions prevail in Haryana and Western UP. Thus, the heartland of the green revolution is in grave trouble. These areas need conservation farming which will help farm families to conserve and improve soil health, water quantity and
quality and biodiversity. Some of the eco-technologies developed by the Punjab Agricultural University are: bed sowing of wheat saving 20 to 25% water, leaf colour chart saving 15% N application in rice, tensiometer based irrigation scheduling, zero tillage technology for wheat, and IPM in cotton saving 40% pesticides. Thus, there is vast scope both to promote Green Agriculture and to reduce the cost of production through enhanced factor productivity. A course on Sustainability Science should be introduced in all Agricultural Universities. India will not be able to maintain a stable food security system, if the “fertile crescent” (i.e. Punjab, Haryana and Western UP) region is not saved through adequate support for conservation farming. Defending the gains already made in this region is an urgent task.

7.9.6.3 An example of the need for support for Conservation Farming is provided by the situation in rice cultivation in the Punjab. At present, nearly 26 lakhs hectares are under rice in the Punjab. Much of the irrigation water used is ground water. The water table in the Central districts of the State producing rice and having 70% of the tubewells is receding at an alarming rate of 2 to 2.5 feet annually. At present about 30% of the tubewells have become submersible and it is estimated that during the next 10 years practically all the centrifugal pumps will become nonfunctional and will have to be converted into submersible pumps. It would therefore be advisable to restrict rice cultivation to 2 million hectares in the Punjab with a yield target of 5 tonnes per hectare. The remaining area can come under maize, pulses and oil seeds which are all at the moment in short supply. Conservation Farming in the Punjab as well as in other intensive agriculture areas will involve a scientific programme of restructuring farming systems. Such a restructuring is an urgent need in the interests of the long term livelihood security of Punjab farmers and food security of the nation. The same is true in parts of Haryana, Western Uttar Pradesh as well as in many of the early IADP districts in the country. NCF suggests that an initial allocation of Rs.1,000 crores may be made for farming systems restructuring based on the principles of ecology, economics, social and gender equity and employment generation in the areas of importance to national food security.
Eternal vigilance is the price of stable agriculture. NCF had recommended in its Third Report the establishment of a science-based National Biosecurity System. The sooner the NCF recommendation is implemented, the safer will be the country from the point of freedom from invasive alien species, which could cause potential harm to crop and animal husbandry, fisheries and forestry. Our wheat crop for example, now faces threats from new strains of rusts like the 78S84 (similar to Yr 27 virulence) race of yellow rust Ug 99 strain of stem rust could also cause trouble. The steps taken to defend the gains already made should therefore include pest surveillance and management and gene deployment for checkmating the spread of pathogens. This is equally important in the case of poultry and animal enterprises.

In every State, the agricultural “bright spots” and “hot spots” will have to be mapped. The State should develop a strategy for enlarging the extrapolation domain of bright spots. Similarly, every State should develop a Good Weather Code to maximize the benefits of adequate moisture availability, a Drought Code to minimize the adverse impact of drought, and a Flood Code both to prevent excessive distress and damage, and to promote a post-flood production plan. In the desert areas of Rajasthan, the Good Weather Code should include provision for raising nurseries of appropriate plants, so that in years of excessive rainfall, an extensive tree planting and sand dune stabilization drive can be launched. This will help to strengthen the ecological infrastructure of the desert, and gradually convert the desert into an oasis. The Drought Code should include the adoption of crop life saving technologies and contingency plans to change the cropping pattern according to moisture availability. “Be prepared” – both to take advantage of a good monsoon and to reduce the impact of adverse seasons – should be our national motto in agriculture.

**Action 2006-07: Contingency Plans and Compensatory Production Programmes**

The first advance estimate of production of foodgrains for kharif 2006-07 has been pegged at 105.2 million tonnes against a target of 115.2 million t indicating an overall shortfall of ten million t. Rice production is likely to be 75.7 million t against a target of 80.7 million t. Such variations may occur more frequently in the future, if
there are adverse changes in precipitation and temperature as a result of global warming and climate change. It will therefore be prudent for the National Rainfed Area Authority to develop computer simulation models on the likely impact of different weather patterns on the major crops. Data from the All India Coordinated trials of ICAR provide opportunities for developing such simulation models. For example, an increase in the average temperature by 1°C during rabi may lead to a reduction in the duration of the wheat crop by 1 week in Northwest India, including the Punjab. This may reduce wheat yield by 400 to 500 kg per ha.

7.9.6.7 The simulation models can help in the preparation of contingency plans to face different weather possibilities. They can also help in making advance preparations for compensatory production programmes during rabi to offset the loss in kharif. Such an opportunity is available only to tropical and sub-tropical countries where crops can be grown throughout the year.

7.9.6.8 The highest wheat production so far was 76.7 million tonnes in the year 1999-2000. Since then, production and productivity have been declining. How do we turn the tide and how can we step up the production of wheat and rice during rabi 2006-07, to compensate for the loss of 10 million t in kharif? First, it must be emphasized that seed reserves are important for crop security, just as grains reserves are important for food security.

7.9.6.9 Second, in wheat there is a vast untapped production reservoir available in UP, Madhya Pradesh, Bihar and Rajasthan. The ICAR Wheat Directorate in Karnal has calculated that we can produce an additional quantity of about 24 million t of wheat immediately by bridging the gap between potential and actual yields, with technologies and varieties now on the shelf (Table 1).
Table 1: Achievable Targets by Bridging Yield Gaps through available Technologies under irrigated conditions (based on National Demonstrations)

7.9.6.10 It will be prudent to launch a well designed farmer-centric compensatory production programme in Bihar, Rajasthan, MP and UP, with priority attention to soil health enhancement and varietal choice.

7.9.6.11 Similarly, there is vast scope for increasing rice production in West Bengal, Assam, Orissa, Andhra Pradesh, Tamil Nadu, Karnataka and even Kerala during the rabi season. The yield of boro rice is high in Assam and West Bengal. Over 27 high yielding rice hybrids are now available to suit different agro-climatic and growing conditions, as well as grain quality requirements. They are from both the public and private sectors. Pusa RH-10 is a superfine, aromatic grain hybrid suitable for cultivation in North-West India. KRH2 is a high yielding and widely adapted hybrid, while DRRH 2 is an early hybrid with a good yield potential. **States with an unutilized yield reserve in their Agricultural Production Bank should be encouraged immediately to initiate action with the guidance of experienced farmers and scientists to utilize the yield reserve wisely to improve production and productivity.** The precise agronomic package will have to be developed on a location specific basis with the help of Agricultural Universities.
7.9.6.12 In the case of wheat, the following nine steps will help to improve wheat production during the 2006-07 rabi season:

- As a result of floods during August / September of 2006, Gujarat, South Rajasthan, Madhya Pradesh and Maharashtra, which account for nearly 7.0 million hectares of land sown to wheat, will need wheat varieties that will mature in 120 days. Farmers would like to sow more wheat due to current ruling prices and availability of good soil moisture. **Preparedness for timely supply of seeds is necessary, along with other inputs.**

- Adequate and timely availability of credit is essential, particularly due to the financial loss suffered during kharif.

- Wheat should be sown before 15 November in NW Plain Zone to get maximum yield and to escape from potential heat stress in March.

- Use of seed drill to capture soil moisture, adopt proper seeding depth and complete sowing in time should be recommended. **Resource conserving tillage agronomy should be subsidized to save water and improve yield.**

- Avoid sowing wheat during late October in the Punjab as such early sown wheat often suffers if temperatures during December are above normal.

- Balanced use of fertilizers including Zinc should be promoted and overuse of urea should be curtailed.

- Pre emergence weed control or a post emergence chemical weed control should be recommended over the Indo-Gangetic plain

- Varietal diversity should be ensured all over the wheat growing region and farmers should grow three of four different varieties to avoid genetic vulnerability to diseases.

- Wherever limited irrigation facility is available, atleast one irrigation around crown root stage / early tillering should be recommended followed by need based weeding and fertilization.
7.9.6.13  **Rabi** and **boro** rice production can be enhanced considerably by giving attention to balanced fertilization, particularly to the supply of the needed micronutrients like zinc, Boron and sulphur. Together with plant protection the enhancement of soil health will help to improve productivity atleast by an additional tonne per hectare. There are nearly 5 million ha under **rabi** and boro rice in the country and improved varieties are available for all the States where rice is cultivated between November and May. Striking progress in improving the yield of rainfed maize, soybean, sorghum, green gram, blackgram, pigeon pea, chickpea, finger millet (ragi), pearl millet (bajra), castor etc., can be achieved through balanced fertilization (NPK and the needed micronutrients). Seeds of improved varieties should be maintained in Village Seed Banks in rainfed areas, so that alternative cropping strategies can be introduced depending upon monsoon behaviour. Improved cultivars alone can enhance productivity by 10 to 50%. Varietal choice should be based on the likely moisture availability. The short duration chickpea variety **Shwetha** (ICCV2) has revolutionized chickpea production in Andhra Pradesh. The productivity increased from 470 kg per ha in 1993 to 1084 kg per ha in 2004. Area also increased seven fold. There are nearly 12 million ha of rice fallows in MP, Orissa, Jharkhand, Chattisgarh and West Bengal. In such rice fallow areas, chickpea can be grown by using residual soil moisture. Simple seed priming technologies like soaking seeds in water and micronutrient solution for 6 hours and drying in shade will help in establishing a good chickpea crop in rice fallows. In Madhya Pradesh 2 million ha remain fallow during the **kharif** season. Using broad bed and furrow, balanced nutrient management and short duration soybean cultivars like Samrat, farmers in the Vidisha district were able to take a crop of chickpea or wheat during **rabi** and thereby double their income. Many such simple steps in soil-water-crop management can lead to major advances in both crop output and farmers’ income. This is the pathway to making farming economically viable.

7.9.6.14  The timely and adequate supply of credit, seeds and electricity, together with addressing the micronutrient deficiencies in the soil will help to offset the loss in production during **kharif**. **Those States which had heeded to the NCF appeal made in**
December 2005 that 2006-07 may be observed as the Year of the Farmer and Agricultural Renewal will be in a much better position to improve rabi production. The 5 pronged strategy recommended then consisted of soil health enhancement, water harvesting and management, credit and insurance, technology and inputs and remunerative marketing.

7.9.6.15 Adaptation to climate change is an urgent task. The Climate Management Unit of the National Rainfed Area Authority should develop computer simulation models of weather behaviour coupled with the public policy and agronomic responses needed to meet diverse possibilities.

Extending the Gains

7.9.6.16 Eastern India (eastern UP, Bihar, Chattisgarh, Orissa, West Bengal, Assam and NE States) have a large untapped production reservoir even with the technologies now available. In these areas, poor water management, rather than water availability, is the major constraint. The Indo-gangetic plains offer scope for becoming the major bread basket of India through an appropriate mix of technology, services and public policies. In many of these areas, the aquifer should be enriched during the S W Monsoon period, and extensive ground water use should be promoted during the October – April period. Given the right strategy, the Ganges Water Machine could become the main anchor for our food security system. Bihar in particular is a sleeping giant in the field of agriculture. The work of IARI in the Dharbhangas district and Sone Command area has shown that the wheat yield can be increased substantially with good seeds and improved agronomic practices. The major bottleneck is however the absence of a Grain Purchasing Machinery which will provide the MSP to farmers.

7.9.6.17 Action to extend the gains of higher productivity and profitability should cover all rainfed areas. This should be a priority task of the National Rainfed Area Authority. The recommendations of the Swaminathan Committee on “More income per drop of water (2006)” should be converted into action plans on a location and farming systems basis.
Making New Gains

7.9.6.18 The immediate prospect for making new gains lies in the areas of post-harvest technology, agro-processing and value addition to primary produce. NCF has made several recommendations in this area in its first four reports. In the longer term, there is need for new yield and quality breakthroughs in major crops through genomics and gene pyramiding. For example, Super Wheats capable of yielding about 8 t/ha are now in the breeders’ assembly line. Such wheats have a complex pedigree and illustrate the importance of genetic resources conservation and exchange.

7.9.6.19 Super Wheats are semi-dwarf with robust stem, broad leaves, large spikes with more number of grains per panicle and more grain weight. The Super Wheat architecture in the breeders’ assembly line, both at CIMMYT and AICWIP, is derived from a blend of Tetrastichon (Yugoslavia), Agrotriticum (Canada), Tetraploid Polonicum (Poland) Gigas (Israel), Morocco wheat (Morocco) and semi-dwarf wheats currently grown in India.

7.9.6.20 We can produce 100 Million t of wheat by 2015, by the following two steps:

- Average yield of 4 t/ha from 25 million ha
- Harnessing the large untapped yield reservoir in eastern, central and western India

7.9.6.21 Every State should develop a detailed agricultural strategy for their major farming zones and systems based on the 3 pronged approach outlined above.

7.9.6.22 Irrigation Water is going to be a serious constraint since as pointed out earlier, ground water is being over exploited. Therefore NCF supports the recommendation of the Swaminathan Committee set up by the Ministry of Water Resources that the Agricultural Year 2007-08 (June 1, 2007 to May 31, 2008) may be observed as “Year of More Crop and Income Per Drop of Water”

7.9.6.23 During this year starting with a kharif of 2007, 5000 Farmer Participatory Action Research Programmes may be initiated throughout the country with the help of appropriate Agricultural Universities, ICAR Research Institutes, ICRISAT and WALMIs.
50 such institutions may be entrusted with the responsibility of organizing jointly with farm families 100 Action Research Programmes each for demonstrating that it is now possible to increase yield and income per drop of water through generating synergy among water, variety, agronomic practices, particularly relating to macro and micronutrients in the soil, and implements. Each programme will cover a minimum of one hectare and will be implemented in a participatory mode, with the farm family having a sense of ownership of the programme.

7.9.6.24 The emphasis will be on rainfed areas where catalytic technological and management interventions will be introduced to make a striking impact. The programme will be so designed that a small Government Project leads to a mass movement in the area of water conservation and use efficiency, as happened in the case of National Demonstrations in Wheat during 1964-65. The economic benefit to the farmer as a result of this programme should be measured. Each Action Research Programme will need about Rs.50,000. Thus the total cost of 5000 Farmer Participatory Action Research Programmes will come to Rs. 25 crores. A well-planned Water Literacy Drive together with the revitalization of traditional systems of water conservation will also be undertaken as a part of this programme. Also, Action Research Projects in irrigated areas will aim at phasing out flood irrigation by the end of the 11th Plan.

7.9.6.25 We urge that such a Farmer Participatory Action Research Programme may be initiated during 2006-07 in arid, semi-arid, hill, coastal and irrigated areas. The necessary financial provisions may be made in the Union Budge for 2007-08.

7.10 Integrated Asset Reform

7.10.1 There is need to complete the unfinished agenda in land reforms. Kerala, West Bengal and now Tamil Nadu have set good examples on the distribution of both ceiling surplus land and appropriate Government land to the landless poor. Tamil Nadu’s recent step in providing 2 acres of land to the landless labour families is commendable. This should be emulated by all States. **We should revive the spirit of Acharya Vinobha Bhave.** In addition, there is need for aquarian reform for the equitable and
efficient utilization of all community and government water bodies. Aquarian reform is also needed in respect of marine fisheries and coastal aquaculture. This should be high on the agenda of the National Fisheries Development Board. Because of population pressure, both land and aquarian reforms alone may not be adequate to provide productive assets. Land and aquarian reforms could form part of an integrated asset reform system designed to provide some productive asset to everyone in the village. Livestock rearing, training in market driven skills or any other form of income security could all form part of an Integrated Asset Reform Policy. Livestock provide good opportunities for strengthening both income and nutrition security. A Livestock Development Council would help to promote integrated attention to all aspects of Livestock Care and Sustainable use. Every Veterinary and Animal Sciences University should establish a Vidya Dairy on the model of the one at Anand, and a Vidya Abattoir to promote the efficient use of the entire animal biomass like skin, bones and blood.

7.11 From Suicide Relief to Suicide Prevention

7.11.1 In the agrarian distress hotspots, there is need for a paradigm shift from “Suicide Relief” to “Life-saving Support”. While immediate relief measures are important, prevention should be the goal. This is the pathway to providing every farm and landless labour family with an opportunity for a productive and healthy life.

7.11.2 The occurrence of farmers’ suicides in several States of the country (particularly Andhra Pradesh, Maharashtra, Karnataka, Kerala and the Punjab), since the year 2000 marks a sad chapter in India’s agricultural history. The extreme step of taking one’s life marks the loss of hope in the prospect for leading a productive and satisfying life. The Farmer suicide tragedy has several dimensions – economic distress and despair, breakdown of social and State support systems and psychological nightmare. The response to this situation has also to be multi-dimensional, with priority going to mitigating economic distress. The various steps taken by Central and State Governments, Prime Minister’s visit to Vidarbha and the different relief packages announced so far have helped to stir hope in the minds of farm families. Nevertheless, farmers’ suicides are continuing.
7.11.3 There is a concern that suicides could lead to socio-cultural changes in our society. For instance, recent research from Oxford University, UK, suggests that imitative suicides occur when suicidal behaviour is portrayed as a natural or understandable response to problems such as financial crisis. Self-poisoning with pesticides account for about a third of all suicides worldwide; hence, the monitoring of pesticide use in the suicide hotspot areas will be useful. The measures to be taken to deal with this situation have been described in the earlier NCF reports. They broadly fall under the following 5 categories:

i. **Saving the Living:** Immediate attention to the livelihood needs of widows and education and employment needs of children should be the first priority. Pain and sorrow can be reduced by the care and concern manifested in the form of concrete action.

ii. **Ending the “debt death”:** Extinguishing bush fires is not enough, but steps are needed to eradicate the causes underlying frequent and continuing bush fires in the form of farmers’ suicides. Immediate action has to be in the form of loan and interest waiver, so that the family again becomes credit worthy. Obviously the loan waiver has to be done with care and after discussion with the affected families and local panchayats.

The debt deaths underline the need for urgent reform of farm credit. China gives loans to farmers at zero percent interest. Obviously, the Government and not the Banks meet the transaction cost. NCF had recommended 4% interest rate based on both government subvention and pruning of all avoidable expenditure by Banks. We are glad that the Centre and State Governments have now arranged to provide credit to farmers at 6 to 7% interest. Further, the credit cycle in drought prone areas should be 4 to 5 years. Also, it should be holistic catering to the needs of farm families for health care, domestic needs and agriculture.

In order to insulate both Banks and farmers from losses, the agricultural insurance system should be revamped and made effective and affordable. Insurance system should cover crop losses arising from both meteorological and marketing factors.
iii. **Strengthening Livelihood and Income Security:** Loans which have led to suicides have often been taken for adopting high cost technology in the expectation that higher returns will be forthcoming. The resource poor farmer has little coping capacity to withstand the shock of crop failure. Similarly, loans have been taken to dig tube wells, which have failed. Technologies should be life-giving and not life-taking. There is need for proper and timely advice on land use planning and choice of technologies. Scientific organic farming will reduce the debt load, because of the substitution of home grown inputs for market purchased ones. Agricultural Universities and Departments have a grave responsibility in this area. Steps to provide crop life saving irrigation need to be stepped up considerably. Remote sensing technology should be used for helping farmers to select sites for digging borewells.

There is also need for providing multiple livelihood opportunities like the rearing of livestock such as dairy cattle, poultry, sheep, goats etc, as well as non-farm occupations in areas such as biomass utilization and post-harvest technology. There has to be an integrated on-farm and non-farm livelihood strategy. Income security largely depends upon output prices and the market. The prices received by farmers for their produce should be at least 50% more than the cost incurred. Low and uncertain returns are among the important causes for farmers’ despair. **As a single step, assured and remunerative prices for farmers’ commodities will help to end the “debt deaths”**. Market reform should be designed to ensure better and more stable income for farm commodities. Central and State Governments and Financial Institutions could establish a **Price Stabilisation Fund** to end distress sales when the crops are good, and where no arrangements exist for providing MSP.

iv. **Life Saving Social Support and Security:** The Gram Sabhas should discuss frequently the economics of farming and methods of avoiding debt deaths. The village communities should strengthen their social support systems, and revive traditional values in terms of support to those suffering from extreme deprivation and distress. Although the joint family system of social support is fast vanishing, the Gram Sabha and Panchayat can develop a **collective security system** designed to prevent suicides.
The Agricultural Universities should form **Hope Generation Teams** to visit and stay for some time in the affected villages and help the farmers in adopting low risk and stable income technologies. At the same time, the Government of India in association with State Governments should develop and introduce a **Social Security System** for farm families, on the lines recommended by the National Commission for Enterprises in the Unorganized Sector. **The other help needed from the Government of India is the undertaking of a livelihood impact analysis of imports and tariff policies.** Policies which are likely to endanger livelihoods should be avoided.

v. **Reinforcing the Psychological Strength:** Youth for Life Corps: There is need for psychosocial measures which will spread the “we shall overcome” spirit. Gyan chaupals can become counseling and hope instilling Centres. A cadre of young women and men who are well versed with counseling procedures, who can help to bring some hope and cheer in the families plunged in darkness and despair, may be formed on the NSS model. **A Youth for Life Corps** should be immediately set up in suicide hotspots by a Consortium of Universities and Social Science Institutions.

7.11.4 An integrated action plan with the above components will help to end suicides related to the agrarian crisis.

7.12 Environmental Sustainability and higher and assured income are the twin urgent needs of Indian agriculture. Our progress in agriculture should be measured not merely by growth rates in production, but also by the growth rate in the real income of farmers. If we are to produce another 100 million tonnes of foodgrains by 2020, we will need the enthusiastic participation of atleast 100 million farmers. They will not produce more if the present uneconomic nature of farming persists. **Ecology and Economics are the twin determinants of the pace of agricultural progress.** While technology is the prime mover of change, technology will succeed in changing our agricultural destiny only if it is environmentally benign and economically viable.

7.13 It would be useful if a comprehensive **Rural-Urban Parity Index** is prepared at the State and district levels in order to help in the continuous refinement of the Bharat
Nirman Programme. If the evolution of rural societies is planned carefully, there will be symbiotic linkages between the village and the town, each enriching the other in both economics and employment opportunities. **Work, water and energy are the key needs of rural India.** The VIth Five Year Plan (1980-85) gave overriding priority to these sectors, together with attention to technology, natural resources conservation, women’s empowerment and enhancement, and remunerative marketing (for the first time, the VIth Plan introduced special Chapters on Environment and Development, Women and Development and a New Deal for the Self-employed). **This strategy resulted in agricultural growth rate (5.7%) exceeding for the first time, the overall GDP growth rate (5.5%)** during the plan period. Thus, given right priorities and strategies, we can accelerate progress both in agricultural growth and agrarian prosperity. It may be useful to revisit the VIth Plan strategies while preparing the XIth Plan.

7.14 Redesignating the Ministry of Agriculture as **Ministry of Agriculture and Farmers’ Welfare** will lead to positive results only if this is accompanied by a structural reorganization. **Leading farmers should be inducted at the senior level in the Ministry for specific tasks and specific periods.** This will help to change the “beneficiary” mindset in agricultural planning to one of regarding farmers as innovators, policy planners and life-givers. Agriculture will then become our nation’s pride and “Jai Kisan” will acquire true meaning and significance.

7.15 **Pan-Government of India Initiatives**

7.15.1 We suggest a **Pan-Government of India Initiative in the areas of food, water and work security and land care during the XIth Plan Period.** A beginning can be made jointly by the Ministries of Agriculture and Rural Development in improving work and income security as well as land care in rural areas through a **Pan Agriculture-Rural Development Programme in the area of skilled and market oriented non-farm employment.** If this does not happen, Jawaharlal Nehru’s statement that “We are a poor people inhabiting a rich country” will continue to remain valid.

7.15.2 We are aware that the culture of a Pan-Government of India coordinated action plan is more easily proposed that accomplished. Necessity is the mother of
invention and we hope that the prevailing widespread agrarian distress, under nutrition and deprivation will lead to the generation of the necessary political will and action, “Where there is a will, there is a way”.

7.15.3 Finally, we urge the Central and State Governments to consider seriously the question of including Agriculture under the Concurrent List in Schedule VII, Article 246 of the Constitution. Important policy decisions like those relating to prices, credit and trade are taken by the Government of India. Also, several pieces of legislation including the Protection of Plant Varieties and Farmers Rights Act, the Biodiversity Act, the Food Bill, etc., are administered by the Government of India. Substantial funds are provided by GoI for rural infrastructure development including irrigation, village roads and markets. By placing agriculture on the Concurrent List, serving farmers and saving farming becomes a joint responsibility of the Centre and States, i.e. a truly national endeavour in raising the morale, prestige and economic well being of our farm women and men.

6. Formulate special programmes for dryland farming for farmers in the arid and semi-arid regions, as well as for farmers in hilly and coastal areas in order to link the livelihood security of the farming communities living in such areas with the ecological security of such regions. Review in this context, all ongoing Technology Missions like those relating to pulses, oilseeds, maize, cotton, watershed etc. and recommend methods of promoting horizontal integration of vertically structured programmes. Also suggest credit-linked insurance schemes which can protect resource poor farm families from unbearable risks. Further, suggest methods of strengthening and streamlining the National Horticulture Development Board.

ACKNOWLEDGMENTS

The National Commission on Farmers expresses its gratitude to the Hon’ble Union Minister for Agriculture, Food, Public Distribution and Consumer Affairs, Shri Sharad Pawar, for having taken keen interest in the work of the Commission and for providing overall guidance to its activities. Thanks are also due to the Planning Commission and Ministers for Finance, Rural Development and Panchayati Raj and for their valuable suggestions.

The National Commission on Farmers would like to sincerely thank the Chief Ministers of various States and their Ministers for their valuable suggestions. Sincere thanks are also due to the senior Officers of the State Governments for the courtesies shown to the NCF teams and for organizing the interaction with farmers and other stakeholders in the States.

NCF is grateful to Shrimati Sonia Gandhi, former Chairperson and other members of the National Advisory Council, for the opportunity given for presenting the Recommendations of the NCF to NAC.

The Commission would also, in particular, like to thank Shrimati Radha Singh, Secretary, Department of Agriculture & Cooperation, Govt. of India, for assisting the Commission at all stages and making it possible for the Commission to complete its work well within the time allotted to it. The support coming from her senior Officers including Joint Secretary (Policy) in the Department of Agriculture & Cooperation is also gratefully acknowledged. Thanks are due to the various Ministries of the Govt. of India and the National Commission for Women for valuable suggestions.

The entire National Agriculture Research System has actively contributed to the deliberations of the Commission and enriched the quality of its work. Vice Chancellors of the Universities for Agriculture, Animal Husbandry and Fisheries deserve all praise for their support. Private sector R&D institutions have also provided excellent inputs which
are appreciated. The National Commission on Farmers is indebted to a large number of farmers, farmers’ organizations, leaders of political parties, NGOs and individuals for their advice and suggestions, both verbally and in writing. The Commission expresses its sincere thanks to the National Academy of Agricultural Sciences (NAAS) for providing logistical support.

NCF also appreciates the valuable technical inputs from various Experts/Consultants in the formulation of its Report and thanks them for their efforts.

NCF acknowledges the valuable technical contributions by Shri S.S. Prasad, and Shri G.C. Pati, former and present Joint Secretary, Ms Mamta Shankar, Director, Ms R.V. Bhavani, OSD to Chairman and Research Officers: Dr. (Ms.) Laxmi Joshi, Dr. Deepak Rathi, Dr. Pavan Kumar Singh, Dr. Ramesh Singh and the sincere work of Research Assistant, Dr. Prabhu Dayal Chaudhary and the secretarial staff of the Commission in the preparation of the Fifth and Final Report.
“To those who are hungry, God is bread” – Mahatma Gandhi, 1946

“Everything else can wait, but not agriculture”- Jawaharlal Nehru, 1947

Our work during the last two years has been guided by the above words of the architect of our independence on the one hand, and by the prime mover of planned development designed to promote faster economic growth coupled with social and gender equity, on the other. The approach to the XIth Plan is “faster and more inclusive growth”. Obviously this aim should cover 70% of our population, who live in villages and whose major occupation is crop and animal husbandry, fisheries, agro-forestry and agro-processing. The four reports submitted by us since December 2004, all contain concrete suggestions on how this goal can be achieved.

This fifth and final report deals with some of the key issues confronting our farmers and farming such as the economic survival of farmers with small holdings in a globalised economy, shaping the economic destiny of farmers, strengthening the ecological foundations essential for sustainable agriculture, attracting and retaining youth in farming, and restoring the glory of Indian farmers and farming. It presents an action plan for making hunger history. The Revised Draft National Policy for Farmers is submitted separately, based on widespread consultations throughout the country as well as extensive advice received from Central and State Government Departments, farmers, farmers’ organizations, tribal families, women’s organizations, academia, civil society organizations, political parties, panchayat institutions, mass media representatives and individuals.
We are indebted to Shri Sharad Pawar, Union Minister for Agriculture, Food, Public Distribution and Consumer Affairs, for his continuous guidance and encouragement and for being the major source of inspiration in our work.

We have chosen for the cover of this Final Report an extract from the Visitors Book of the National Dairy Research Institute, Bangalore, showing the Father of the Nation identifying himself as a “Farmer”. It is this pride in farming, both as a way of life and means to livelihood that we should revive. This is the pathway to “Purna Swaraj” and this report shows the way.

STATE LEVEL CONSULTATION OF ANDHRA PRADESH FOR FEEDBACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT HYDERABAD ON 6th JULY, 2006

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Hyderabad on 6th July, 2006. The NCF was represented by Shri Atul Sinha, Member Secretary, NCF, Dr. R.B. Singh, Member and Ms. Mamta Shankar, Director, NCF. Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

2. Inaugural Session

At the outset, the Principal Secretary, Agriculture and Horticulture welcomed the NCF team and participants. Commissioner Agriculture made the following points:-

i) Over emphasis on credit without increase in plan budget will not help. Plan expenditure must go up.

ii) Farmers’ voice should be heard on a continuous basis.

iii) Farmers had to pay very large price for transgenic seeds. Knowledge was a public good. Interest of farmers must be protected while pricing the transgenic seeds. New Seeds Act was required with built in flexibility in procedures. ICAR should encourage research in public domain for transgenic seeds. Terminator genes should not be allowed.

iv) The State was facing adverse agro-climatic situation with 70% of its area under rain fed farming and 24% of water obtained from ground water resources. There was a need for increasing productivity in dry lands. Farmers had to be protected and Agro meteorology, with location specific forecasting was very important for
contingency planning for inputs like seeds and fertilizer, at the time of sowing. Remote sensing should be improved; it will provide a wealth of data. There was a need to work out cost benefit ratio for rain fed farming and make it credit worthy.

v) There was a need to focus on obtaining returns commensurate with cost of cultivation and finding markets. Integrated farming should be financed.

vi) In the AP pilot insurance scheme, village was a unit in 5 districts for a single crop and it had helped. This was proposed to be extended in the entire state.

vii) There should be a Price Regulatory Authority for input prices.

viii) There must be subsidy for micronutrients and increase in subsidy for Potassic and Phosphatic fertilizer since these were important inputs.

ix) Large numbers of labs were needed for testing of pesticides.

x) Farm mechanization research was needed.

xi) Validated scientific practice was needed for organic farming.

xii) There was too much confusion in Agri Export Zones Scheme which was mostly operating on papers.

xiii) Education of farmers was a must. At least 30% of the extension workers should be women. Internet, TV etc. must be used for extension.

xiv) After the implementation of the NREGP the cost of labour has gone up in the concerned districts.

3. General Observations and Suggestions

i) There should be a paradigm shift in policy and not patch work through small interventions.

ii) Farmers’ Commission should not be wound up. It should watch the implementation and do evaluation and monitoring to ensure the implementation of Recommendations. Without these activities many good Reports had remained on papers. Jayati Ghosh Commission, Justice Ramachandra Reddy Committee had also made recommendations but no action had been taken.

iii) A farmer should be the co-chair of the NCF and it should have a woman member too.
iv) In 1968, the green revolution was launched with a farmer oriented approach. At present, we were more under the influence of the MNCs and middlemen.

v) The Policy did not spell out lessons drawn from ‘ecological disasters’ and ‘technology fatigues’ during the last 40 years of Green Revolution and steps had to be taken to prevent them. The Policy on the other hand, tries to continue the same framework of more inputs, monocropping, industrial control on inputs and marketing etc.

vi) The Policy tacitly accepted liberalization and privatization adopted in agriculture without analyzing its effects on farmers and it missed on the ways to strengthen farmer centric research system and farmer-centric extension system. Policy should have sustainable vision.

vii) The Policy should aim towards more farmer and knowledge centric planning than input and industry centric planning. Policy should reverse the present trends of corporatizing agriculture.

viii) The process should be handed over to farmers and their organization to discuss and input into the Policy to make it farmer led and more broad based and to address the issue of sustainability and equity.

ix) Draft Policy talked about the need to recognize root causes for farmers’ suicides but it did not talk about fixing liability for mistakes committed. Policies should not be created without accountability.

x) Small farmer/marginal farmer/agricultural labour had to be kept in focus while making recommendations. There was no ground monitoring system. In each state, this should revolve around small farmer needs.

xi) It was a hope generating policy. NCF wording was too soft. It was a feel good document.

xii) NCF had not gone deep into root causes of agrarian crisis. IMF Structural Adjustment Plan included policies like reduction in government expenditure and curtailment of rural credit, winding up of extension, wage restraint on workers etc. These policies worked in the developed countries but had led to adverse impact on Agriculture in several developing countries. They had advised diversification into non-cereal crops leading to food shortages and imports and
thereby leading to external dependence for survival. This had not been nailed down in NCF Reports.

xiii) The Parliament had passed the Fiscal Responsibility Act. Now, World Bank was asking the States to do the same.

xiv) Since 68% of population was in Agriculture, atleast 68% of Budget is to be allocated for agriculture.

xv) Reinvestment surplus was not being generated from farming.

xvi) Scale of farming was too small for mechanization.

xvii) TVE system of China should be followed for rural prosperity.

xviii) No rural youth less than 20 years wanted to remain in farming.

xix) Policies had a pro consumer rather than a pro farmer orientation.

xx) Students should be taught environment and agriculture too, at school stage.

xxi) NREGP should be operated only in off-season.

xxii) Agricultural Workers Bill has been pending in Parliament for too long and should be passed soon.

xxiii) Policy has not said anything for security of landless labourers. Policy should expressly recommend enactment of Comprehensive Agriculture Workers Welfare Act to take care of social security and welfare needs of agricultural workers.

xxiv) NCF should recommend that government should strengthen tenant farmer organizations.

xxv) Data on suicide by women farmers, gender based asset mapping, and women registered under NREGP are necessary.

4. Land

i) Large lands have been given away at throw away price for corporate farming. This would be undesirable.

ii) Land Reforms should be completed and at least 1 acre with assured water supply should be allotted to the landless. There should be asset security.

iii) Conversion of land for real estate was taking place at an unprecedented scale.

iv) Government was not developing rural areas.
v) No investments had been made for land development.
vi) Large Public Investment should be made to make land productive.
vii) Land should be allotted to landless and not given to big firms for growing bio fuels.
viii) Since small holdings had been proved to be more productive, the recommendation in the Draft Policy in favour of land consolidation should be removed.

5. **Livestock**

i) Pastoralists have to make sacrifice for large dams. Agro Biodiversity is also threatened by large dams. Tanks are better in rainfed areas.

ii) Adequate livelihood security of displaced pastoralists should be ensured.

iii) In situ conservation of local breeds should be promoted. Policy of promoting cross breeds is antithetical to the promotion of the local breeds.

iv) Grazing lands should not be used for bio diesel plantation.

v) We do not need off shore genetic centre for screening germplasm. Onshore Centres should be preferable.

vi) Strong public disease management system will better serve the needs of resource poor farmers as compared to agri clinics.

vii) Every farmer should have milch animals to support his income from crops.

viii) Government should provide animals on subsidy to farmers which would also facilitate organic farming.

ix) A milk producer is not getting Rs 18 for one litre of milk whereas bottled water is sold at Rs. 12 per litre.

x) Organic farming is not possible unless dairy development is encouraged.

xi) Livestock rearing should be linked to agriculture in general, not just for ‘organic farming’ since is the only sustainable way forward. Existing livestock Departments should be strengthened, instead of relying on agri-clinics.
6. **Technology, Research Inputs and Extension**

i) Lacunae of green revolution should be removed before going into the second green revolution.

ii) No new technology was needed. Only appropriate policies and funds should be ensured for rural areas.

iii) Scientists should be accountable for wrong advice given to farmers.

iv) Use of term ‘bio security’ was confusing. It should include ‘bio safety’ as understood now in the context of GM crops for protection of health and trade security of the nation. The formulations in the Policy in this regard were inadequate.

v) There was no distinct advantage from GM crops.

vi) There should be a debate on whether we need transgenics which were very costly.

vii) Technology, inputs including seeds incentives etc. should be provided in time.

viii) Bio fertilizers were very costly and needed subsidy.

ix) Our research policy should be Small Farmer/Marginal Farmer oriented.

x) Better audio visual aids for organic farmers were needed.

xi) Organic farming saves land and water and a special package was needed for its promotion.

xii) Organic farming should be provided by formulating a package of practices.

xiii) At least 30% subsidy for organic inputs was required besides seeds which were subsidized.

xiv) There should be social control on research.

xv) Public domain research was a must.

xvi) Seed Act 2004 was in favour of the corporate sector. No protection to farmers from spurious seeds or high prices was provided.

xvii) SHGs should grow their own seeds. They needed a lot of capacity building.

xviii) Land to lab transfer of technologies was also required. Universities should learn from success stories in rural areas.

xix) There should be research on impact of Bt cotton crop residues – we should have precautionary principle in place.
xx) There should be price control on seeds.
xxi) Farmers face difficulties in approaching Consumer Courts and producing evidence when they had complaints against seed quality.
xxii) More stress should be given to technology acceptable to farmer.
xxiii) Research should clearly indicate the income it will give to the farmer.
xxiv) Many suicide cases were due to lack of access to correct knowledge and correct inputs.
xxv) Policy should allow full freedom to farmer to decide his technology.
xxvi) Seed issues were not dealt with adequately- Government should have a central role for this vital input.
xxvii) Extension services needed to be strengthened in the State and soil testing had to be conducted in almost every land holding.
xxviii) Certified seeds should be supplied to the farmers in time.
xxix) Private research claims should be verified and advised to farmer.
xxx) We should promote organic farming as is done in Uttaranchal. Every farmer should have livestock, horticulture along with agriculture.
xxxi) There was a need for shifting to organic farming in chemical fertilizer intensive areas.
xxxii) Vermi-compost should be prepared on a large scale and subsidy should be given to the farmers for its use to popularize it.
xxxiii) Central Government should take into consideration the cost of all inputs while deciding and fixing prices of commodities/produce.
xxxiv) Seeds, which were resistant to unfavourable seasonal conditions should be developed.
xxxv) Groundnut resistant to pests should be developed.
xxxvi) Research has to be conducted on wilt pest.
xxxvii) Horticulture crops have to be developed.
xxxviii) Before another green revolution is attempted, the existing government staff should be reshuffled.
xxxix) Inputs such as seeds and fertilizers should be provided in time.
Hybrid paddy could be grown with the use of chemical fertilizer if necessary with the help of banks.

7. **Credit and Insurance**

i) Section on credit and insurance does not talk about the need for reducing credit for agriculture through appropriate technology and other means. Agriculture technology has become a profit-earning tool for private enterprise at the expense of farmers. Need for such inputs should be questioned.

ii) Since Government is not providing sufficient assistance to farmers for rainfed crops, agriculture has become a gamble for the farmer and he gets trapped in debt.

iii) Farmers have no other choice but to approach private money lender since banks are not providing adequate finance for Agriculture.

iv) Farmer has to go to the moneylender for his other needs too, and later commits suicide since the returns from agriculture are minimal. Drought also exacerbates the problem.

v) Rescheduling of loan, as worked out in the relevant RBI circular, is ineffective because of large interest burdens. On rescheduling of loans a farmer borrowing Rs. 10,000/- is required to pay more than Rs. 27,000. Only 35-40% loans are rescheduled and compound interest is charged by banks.

vi) Mere rescheduling of loans was not sufficient. Whenever required, a critical analysis of reasons and the methodology had to be developed, so that the farmer could come out of the debt trap.

vii) People who had suffered drought for 5 years should have their loans written off. Private debts do not get rescheduled or written off. These debts should be waived.

viii) Rs.3000 crores of non-performing assets have been written off for industrial borrowers but a similar facility is not being provided to poor farmers.

ix) Every farmer/ labourer should be adopted by a financial institution.

x) Under Usurious Loans Act, banks cannot charge more than 9%. Banks are however charging excessive interest.
xi) Banks are not achieving 19% agriculture lending target under Priority Sector lending.

xii) It was time to introduce the concept of a production budget.

xiii) Our Embassies should identify export potential and the information should be passed on to the farmers along with quality requirements.

xiv) Farmer expenditure had increased geometrically but income have been growing arithmetically, only.

xv) Farmer has to pay stamp duty which should be reduced. Mortgage should be created on a declaration given by the farmer.

xvi) Government should waive stamp duty for farmers.

xvii) Credit requirement should be worked out for family and should be given to them as term loan for 5 years so that one crop failure and default of short-term installment loan does not derail him.

xviii) We need assured credit flow even for tenant farmers at 3 per cent interest.

xix) “Raithu Mitra” scheme to help tenant farmers is unique for AP based on self declaration.

xx) Farmers should be provided credit at 4 per cent simple interest by all banks i.e. nationalized, cooperative and regional rural banks.

xxi) Insurance premium should be borne by the Government.

xxii) Every farmer should get compensation in use of natural calamity/crop failure. Farmer should be the unit of crop insurance.

xxiii) The norms governing relief from natural calamity should be relaxed as and when required, particularly when crops are affected by repeated adverse weather conditions. Farmers should be provided with subsidy for payment of insurance premium. Comprehensive insurance should be provided to the farmer.

xxiv) A “Farmer Welfare Fund” may be created for the welfare of farmers and provide social security to all categories of farmers i.e. horticulturists etc.

xxv) National Agriculture Insurance Scheme is not responsive to the losses of the farmers.

xxvi) Even though government is collecting cess for land, it is not providing any financial help.
xxvii) It is necessary that farmer is provided social security since he is providing food security to the nation.

xxviii) It is necessary to provide insurance for failed bore wells. Government should create awareness about bore wells and insurance together.

xxix) Insurance claims should be paid immediately. The evaluation procedures are too long.

xxx) Crop insurance should be more friendly to the farmer.

8. Marketing, Distribution and trade

i) All suicides have taken place in the cotton belt. Cotton area went up due to higher international prices until 1977 after which there was a 55% decline in cotton prices. Policies of Government of India were framed in the interest of the textile industry. Liberalization of cotton imports led to depressed prices and ruining of farmers.

ii) DOHA Round will be damaging to the Indian farmer.

iii) We should have “variable custom duties structure” - but it was not implemented.

iv) Agricultural subsidy was reduced in 1991 and should be increased up to 10% as permitted by WTO.

v) Farmers who have provided food to the country have no food security for themselves.

vi) Mission statement should also include promotion of national food security in view of an unequal trade policy.

vii) Imports of edible oil were made without checking the domestic production. Imports should be decreased to protect the interest of farmers.

viii) ITO should be set up.

ix) Policy talked of opportunities available for external agricultural trade without specifying these opportunities.

x) Farmers were not getting benefit of support price since they had already sold their produce to middlemen for buying inputs.

xi) Govt. should announce “Remunerative Price” and not “Minimum Price” and Govt. should buy at least 50% of produce.
xii) Recommendation for contract farming should be withdrawn. The experience of contract farming in Kuppam in AP had not been good. Government should be the third party in contract farming – Govt. must arbitrate. Unless bona fides of contracting firms were established, Govt. should have a third party role.

xiii) Farmers were not getting premium price for organic produce.

xiv) The details of Price Stabilization Fund like its size and conditions under which Govt. will decide to intervene and the institutional mechanism for implementation were not spelt out. Input prices also needed to be regulated. Besides, farmer should get a fair share of the consumer prices after covering his cost of production.

xv) Millet etc. should be included in PDS. PDS should be strengthened. Farmers should be protected as consumers. Food quality and food assurance had to be ensured.

xvi) No one in mandi bothered about farmers. The staff should assess likely arrivals and make suitable arrangement.

xvii) NDDB model was suitable for domestic markets.

xviii) Cooperative service system could be very helpful instead of contract farming.

xix) Millets etc should be brought under MSP.

xx) Middlemen should be avoided in the marketing system and farmers should be provided with MSP support for their crops.

xxi) Farmers should be ensured with reasonable price for their produce through promotion of exports and by constructing cold storage/godowns.

xxii) Government should provide MSP support along with market intelligence.

xxiii) There were serious concerns in farmers’ bodies on several changes proposed in APMC Act. Hence it could not be called farmer-friendly.

9. **Dry Land Farming**

i) All manure is going into irrigated areas and no soil enrichment of dry land is taking place.

ii) Big dams are necessary – There is no alternative for achieving higher production – We should not allow our river water to go to the sea.
iii) Mixed crops are very useful in dry land areas.
iv) Although soil fertility is very important, Soil testing is negligible.
v) Policy should specifically talk about a Separate Policy for rainfed areas and farmers there.
vi) The Policy should pay special attention to rainfed farming and support system required for these regions. It should promote eco-technologies and not genetic engineering as alternative paradigm.

10. After the Consultation session, Members of the NCF assured the full consideration of the suggestions and written representations made by the State Government and participants. They also thanked the State Government for the courtesy shown.
STATE LEVEL CONSULTATION OF ASSAM AND NORTH-EASTERN STATES FOR FEEDBACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT GUWAHATI ON 8th SEPTEMBER 2006.

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Guwahati on 8th September 2006. The NCF was represented by Shri Atul Sinha, Member Secretary, Dr. R.B. Singh, Member and Ms. R.V. Bhavani, Director (Tech.). Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

2. General Observations and Suggestions

i) There should be a separate section on the Northeast.

ii) The definition of farmers should include those engaged in Piggery. Pigs in Assam are not reared by scavengers as mentioned in 3.5.14.0. Duck farming is also important in Assam.

iii) Assam should be included among the goat producing States of India.

iv) There should be State and district level awards for outstanding farmers.

v) Farmers should get representation on policy making bodies.

vi) The closed season allowance for fishers should be at least Rs.2000/- p.m. and should also apply to farmers during drought period.

vii) Forest policy must be coordinated with agriculture policy.

viii) All districts in the Northeast should come under NREGP.

ix) Interests of farmers should be the prime consideration in promoting crops; Oil
palm has no prospect in Assam but was suggested for promotion whereas rapeseed and mustard which are popular among poor farmers are not encouraged.

x) Roadside and homestead planting of fruit trees must be promoted to promote nutrition.

xi) Each district should have an Agricultural Park based on cluster village approach, with facilities for processing and market linkages.

3. **Land**

i) Wasteland should be allotted to small and marginal farmers and women farmers.

ii) Jhum cultivation needs support.

iii) 20 ha land is needed for sanction of micro irrigation projects – not feasible in hilly States.

iv) Embankments should be removed to ensure that all agricultural land becomes levelled.

v) Penalty should be levied on encroachment of cultivable land.

vi) For a farmer, losing his land is like losing a family member. Loss of farmland due to severe flood and erosion should be eligible for compensation.

4. **Water**

i) Hill areas need mobile HP motor that can be moved from one place to another.

ii) There are many incomplete projects in the region.

iii) The waters of the Brahmaputra should be properly harnessed with dams at various levels to address the problems of flood and drought.

iv) Many farmers are affected by arsenic/fluoride poisoning of water.

v) ‘Beels’ (water bodies) should be renovated for water harvesting and promotion of fish culture.

vi) National Rainfed Area Authority must include programmes for high rainfall areas also.

vii) Construction of tank should be in the farmer’s field under community management for irrigation water and fishery.
viii) Watershed management should address siltation not only in the river bed but also in the natural water body.

5. Livestock

i) Fodder Banks should be setup to reduce high cost of animal feed.

ii) Dairy marketing needs attention; NDDB should be requested to setup a State office in Assam.

iii) Disease control measures have to be properly implemented. Vaccines are in shortage.

iv) Non-availability of suitable germplasm is a problem.

v) A mission mode approach is needed for livestock development.

vi) There is no compensation for an animal’s death.

vii) FCI should procure animal feed ingredients at places of production and allocate to feed compounding units/farmers.

viii) Locally available feed ingredients should be incorporated where possible.

ix) Artificial insemination with selective breeding should be undertaken for upgradation of indigenous germplasm.

x) Organizational mechanism has to be developed for research support to livestock sector.

xi) Burning of cowdung should be prohibited and it should be used as manure in gobar gas plant.

xii) There should be ‘Pashu Vigyan Kendra’, on the lines of ‘Krishi Vigyan Kendra’, wherever livestock is the predominant activity.

xiii) There should be animal Quarantine Certification Station in the NE, especially because of the international porous borders.

xiv) Farm School for dairy farmers is also a necessity.

xv) Cattle transport to the NE is banned by the railways. But their induction is important for cattle breeding to improve productivity.

xvi) Restrictions on grazing and camping in wildlife sanctuaries is necessary as control of diseases of wild animals and birds is difficult. Modify 4.8.4 accordingly.
xvii) Breed conservation – modify – “users group may decide to keep only **accredited breeding males** (instead of certain) and those could be used on payment basis.[ Para 3.5.8.0 in Draft National Policy for Farmers]

xviii) Parent farms of high quality livestock and poultry seeds should be established

xix) Guidelines under the Indian Veterinary Council Act should be the basis for training for para-veterinarians.

xx) A Regional Lab and Gene Bank under the National Bureau of Animal Genetic Resources should be setup in NE India, to facilitate characterization and conservation of the indigenous germplasm in this part of the country, e.g. swamp buffalo, Nageswari duck, Pati duck, Miri poultry, Assam local goat and pig, etc.

6. **Research Technology & Training**

i) Opportunities for farmers to visit farms in other states and countries to learn better techniques, will motivate them.

ii) Greenhouses do not have facility for monitoring temperature.

iii) Horticulture should have support of drip irrigation facility.

iv) Technical advice for handling pest/insect attack is not forthcoming; e.g. bacterial wilt attack on ginger; insect attack on mushroom during peak summer.

v) Location specific cropping systems research is needed.

vi) Tripura needs an Agricultural University/College for effective extension.

vii) Schemes should be formulated according to local climate and farmers’ needs instead of centrally recommended uniform scheme.

viii) Change in mindset is needed. Technical extension has to be handled by technical people in participatory manner.

ix) An inventory of extant indigenous technologies should be built.

x) Community Information Centres can play an important role in cross learning from local experiences and other parts of India.

xi) Research institutes should focus on developing low cost implements, harnessing effective indigenous technologies
xii) Horticulture and Agro-processing research and training institute is a must in the region.

xiii) KVK may be developed to offer residential training courses by adopting the approach of ‘Earn while you Learn’.

xiv) Sons and daughters of farmers need reservation for admission in Agricultural colleges.

xv) 75% of ICAR research should be on farmers’ fields.

7. **Credit & Insurance**

i) Joint patta will not resolve problems of landless for credit. They should get funding support for training.

ii) Rate of interest on Kisan Credit Cards is very high.

iii) All farmers should be covered under crop insurance not just those who have taken loans.

iv) Rate of interest should be 3% in the NE due to greater hardships faced in the region.

v) The Cooperative credit structure should be revived.

vi) Bank credit is not forthcoming even on proposals passed by the Horticulture Department.

vii) There should be insurance support for crops and animals affected by natural calamities.

viii) Cooperative banks need support from government to comply with requirements under section 11. They do not get any refinance from NABARD.

ix) The functioning of the banking system should be reviewed and rectified.

x) Farmers need health insurance; A Policy on the lines of ‘Employees State Insurance Scheme’, has to be adopted.

8. **Market & Price**

i) Orchid production should be commercialized.

ii) Farmers don’t get the right price for vegetables.
iii) There should be a ‘Terminal Market’ at Guwahati to promote direct farmer sale.
iv) There should be a separate Regional Master Plan for market development in the NER integrating them with the market in SE Asia.
v) Lack of cold storage facilities and well-equipped carriage vans hampers border trade with Tibet/China, which can yield good returns.
vi) Sikkim should be declared Organic State and export market developed.
vii) New crops are being introduced under the Technology Mission, but the markets are not being identified and developed.
viii) There should be community cooperatives at Panchayat level to prevent distress sale.
ix) FCI is not buying any produce from the NE.
x) MSP has no meaning to farmers in Assam, as their cost of production is high.
xi) Contract farming of poultry and feed ingredients maybe promoted, especially maize and sweet potato.
xii) Producer companies on the lines of NDDB’s SAFAL should be promoted.
xiii) Price of tea is determined by the international market. Small tea growers need a price stabilization fund to protect them from fluctuations.
xiv) Commercial floriculture under Public Private Partnership [PPP] model can be promoted among urban growers organized into groups, like the women farmers’ groups in Mizoram.

9. **Fisheries**

i) Many fish are coming from outside Assam. Inbreeding hampers production of indigenous species and should be addressed. ICAR should undertake an impact study on effect of introduction of exotic species from Bangladesh and Myanmar, like Thailand Magur, Big Head etc.

ii) Pisciculture should be promoted through long lease of the water bodies.

iii) NFDB should have two wings – Fresh Water and Salt Water. The Centre for Fresh Water should be located in Assam.

iv) Forest fishery, which covers an area of 5017 ha, offers ideal sites for in situ
conservation of fish germplasm. This can be done through farmers’ participatory approach by the Fishery Department, if standing Forest Acts are suitably amended.

v) Identified natural bodies under forest area should be declared ‘fish sanctuary’, for in-situ conservation of fish germplasm of the region.

10. Agriculture

i) This is a branch of sericulture with lot of potential. No killing of the silkworm is entailed. So it can be widely encouraged.

ii) At present there is no policy for plantation for this purpose and women have to go to the forest to collect leaves for feeding.

iii) Women SHGs can be promoted to rear cocoon and reel silk. At present there is no reeling unit.

iv) The manufacturers have a problem of capital to purchase yarn. There should be yarn banks.

v) Farmers end up selling at low rates to buyers from outside the region.

11. Labour & Inputs

i) Cost of labour is very high and unviable to employ. (Rs.100/- for women & Rs. 150/- for male).

ii) Quality seed supply is a constraint.

iii) Gaon Panchayat Somobai Samiti used to supply all agricultural inputs earlier. These maybe revived and linked with the VKC movement.

iv) Farm inputs should be supplied at subsidized rate; seed, fertilizer, plant protection chemicals.

v) Seed banks should be promoted for maintaining right variety and quality of seeds and ensure availability during calamities.

12. Dissemination

i) Central Govt. Websites should be in local language.

ii) Information kiosks should be promoted.
iii) There should be a conscious policy to shift population to non-farm activities.

iv) Farmers in the region need special consideration like in the Vidharbha.

13. After the Consultation session, Members of the NCF assured the full consideration of the suggestions and written representations made by the State Government and participants. They also thanked the State Government for the courtesy shown.
STATE LEVEL CONSULTATION OF BIHAR FOR FEEDBACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT PATNA ON 12th JULY, 2006.

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Patna on 12th July, 2006. The NCF was represented by Shri Y.C. Nanda, Member, Dr. R.B. Singh, Member and Dr. Ramesh Singh, Research Officer. Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

2. General Observations and Suggestions

i) It was good to note that the draft policy was in favour of small and marginal farmers as about 80% of the farmers of Bihar fell in the above categories.

ii) Non farm activities in rural areas are almost extinct with the result that there were very little employment opportunities outside agriculture. This is one of the important reasons for migration of rural people to urban areas.

iii) Timely availability of fertilizers, seeds and irrigation water were the major problems.

iv) In some areas, rearing of goats has become a profitable occupation for rural people.

v) Bihar should get the status of most favoured State regarding institutional support and infrastructure development.

vi) There is a lack of transparency in sale of seeds by Government/cooperative agencies.

vii) At present, most of the farming related work is handled by comparatively elderly people or those young men and women who are unable to migrate from their villages.
viii) It was reported that about 50% work of agriculture was done by the women; they should be given special treatment by formation of women group. This would lead to capacity building, skill development and general upliftment of women in the rural areas.

3. **Soil Health Care**

i) Soil testing facilities are poor. There is need for assessing the micro-nutrient deficiencies of soil. All farmers should be issued soil health cards.

4. **Irrigation**

i) Farmers are spending major part of their resources on irrigation.

ii) Community based common irrigation sources should be developed.

iii) Rejuvenation and maintenance of existing water bodies was important and should be given high priority.

5. **Research, Technology & Extension**

i) Agricultural scientists should visit the farmers’ fields more frequently.

ii) In Bihar, the crops like maize and rice had potential for increasing income of the farmers.

iii) KVKs should support Litchi and Mango growers to make Bihar the Litchi and the Mango State of India.

iv) Rejuvenation of old orchards should be given higher priority over plantation of new horticulture farms.

v) KVKs should provide custom hiring of harvesters to the farmers for harvest of crops to ensure timeliness in sowing of next crop.

vi) Farmers should be trained in nursery management.

vii) Government should have a plan for distribution of tree plants to farmers at nominal prices so that they take interest in planting trees.

viii) There is a need for different cropping pattern to suit irrigated and dry areas of the State.

ix) Traditional crops were important to provide livelihood security to the rural poor.
x) Agriculture should not be treated only as a State subject.

xi) Gyan Choupals should be established at least in every Panchayat at the earliest. These should serve as single window information source and should impart literacy regarding credit, insurance, trade and quality.

6. **Credit and Insurance**

i) Banks ignore farmers in general and the small and marginal farmers in particular for providing credit. Their focus is on financing bigger farmers who have better repaying capacity and collaterals to offer against their loans.

ii) Professional moneylenders provide loans to farmers at a very high interest rate i.e., around 4% per month.

iii) A high percentage of loans for installation of tubewells are misutilised for consumption purposes.

iv) NABARD should do direct financing

v) Outreach and quality of credit must be improved. Inefficiencies of the delivery system should not be loaded on the farmers. The State Government should also support the banks in delivery/recovery of credit from farmers.

vi) Farmers do not have recurrent monthly income. Larger farmers also face temporary cash shortages, therefore, the banks should also provide consumption loans subject to the repaying capacity of the farmers.

vii) There is need for upscaling the professional knowledge and managerial skills of the staff of the cooperative banks.

viii) Pledge loans should be provided by banks to prevent “distress sale” by the farmers.

ix) It is well known that agriculture is high risk activity and the crop insurance is the only solution to save the farmers from distress. At present, the matters regarding assessment of loss and settlement of claims under the crop insurance scheme are not satisfactory.

x) The assessment of damage to crop is based on average yield in the Mandal and not on the basis of the yield in the farmers’ field who had taken the crop insurance cover. Further, the crop insurance as in operation now, mainly protects
the bank and not the farmer. The insurance system needs reform and insurance policies which cater to multiple needs of farmers (production, health, accident etc) need to be developed. Farmer friendly cattle insurance is also important.

7. **Market and Investment**

i) Need for formation of farmers’ groups in large number for input delivery and marketing of produce.

ii) Marketing of agricultural produce should be done by the farmers’ groups on the pattern of NDDB.

iii) Increase in farmers’ income is most important and for that assured market is essential.

iv) Storage facilities should be provided to farmers at concessional rates so that the farmers could keep their produce till prices improve.

v) Diesel subsidy upto 50% should be given to the farmers to reduce the input cost of cultivation.

8. **Observations made by Dr. H. P. Singh, Vice Chancellor, Bihar Agricultural University, Pusa**

Dr. H.P. Singh, Vice Chancellor, Bihar Agricultural University, Pusa, who was appointed by the Government as the nodal point for the Consultation, highlighted the following recent agricultural trends in Bihar:

i) Integrated farming should be promoted as per the need of specific locations – a mechanism for minimizing the risk from natural disasters occurring frequently in the State.

ii) On the principle of “Build, Operate and Transfer” (BOT), the Government should provide post harvest and value addition facilities to rural entrepreneurs for prevention of post harvest losses as well as for providing employment opportunities in rural areas.

iii) While promoting integrated farming, among crops, sugarcane, maize, rice, oilseeds and pulses should get high priority. Among livestock, buffaloes should be given greater attention than in the past. With the success of SUDHA Dairy –
based on the NDDB Model – the livestock sector has high growth potential and income generation by the farmers. Honey production is also being attached with SUDHA Model.

iv) On the pattern of Nalanda, the Pusa Complex, Samastipur, should be declared as a National Heritage site and a National Museum for farmers and others should be established involving the activities of the University as well as of the IARI’s Regional Research Station at Pusa – established more than 100 years ago as the first scientific agricultural research centre in the country. The Museum should also exhibit the rich genetic resources and indigenous knowledge of Bihar.

v) The State has already established the Bihar Farmers’ Commission, chaired by Shri Ramadhar (Retired IAS) and a former FAO officer.

9. After the Consultation session, Members of the NCF assured the full consideration of the suggestions and written representations made by the State Government and participants. They also thanked the State Government for the courtesy shown.
STATE LEVEL CONSULTATION OF CHHATISGARH FOR FEEDBACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT RAIPUR ON 8th AUGUST, 2006.

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Raipur on 8th August, 2006. The NCF was represented by Shri Atul Sinha, Member Secretary, Dr. R.B. Singh, Member and Dr. Prabhu Dayal Choudhary, Research Assistant. Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

1.2 Agriculture Production Commissioner, Govt. of Chhatisgarh, welcomed the participants and explained the importance of farmers’ welfare and development for Chhatisgarh. The State has about 50% area under forest and 72% of farmers belong to small and marginal category. Only 27% of land is irrigated. Most of the land is under single cropping. Paddy is grown in about 30 lakh ha. of area which is mostly single cropped area. State Government’s priority to cover at least one third of this area under double cropping in rabi was highlighted.

1.3 Hon’ble Minister of Agriculture, Govt. of Chhatisgarh in his remarks highlighted the following factors essential for improving economic condition of farmers:

i) Availability of electricity for agriculture.

ii) Bank Credit with interest @ 7% to the farmers.

iii) More farmers are adopting organic farming in view of rise in input cost. Hence steps are being taken to facilitate organic farming by having a certifying agency at State level apart from other measures.
iv) Schemes for increasing irrigated areas through new projects, drip and sprinkler irrigation projects were emphasized and the farmers of the State were adopting these in a big way.

2. **General Observations and Suggestions**

i) Dignity of the farmers was a major issue according to some farmers. Agriculture should be commercialized so that young persons are attracted to it.

ii) Electricity tariff for using implements for animal husbandry and fisheries was higher than the rate applicable for agriculture in Chhatisgarh. Electricity Regulatory Commission had stipulated a higher tariff for “high-tech agriculture” compared to agriculture. This will discourage horticulture, pisciculture and other forms of agriculture that can yield higher farm income.

iii) Social audit of programmes and schemes being implemented by Govt at Gram Panchayat or village level should be taken up. The schemes were generally not benefitting farmers.

iv) Fake farmers grabbing land for “Farm house” should be taken to task by Income Tax Department since they were showing large income for agriculture without cultivating any land.

v) Small/ marginal farmers were facing difficulties since they could not engage agriculture workers and their income was less than landless agriculture workers due to high wages.

vi) Impact of sponge iron plants on neighboring farms was adverse. The units were not operating ESP to control pollution. Pollution norms be strictly enforced since it is adversely affecting environment.

vii) The benefit of 25% subsidy from State Government was not benefiting farmers since the concerned items were priced higher by about 15-20%.

viii) Local crops and coarse grains produced by farmers should be given priority for procurement under MSP operation and PDS and local aromatic rice should be procured at a higher price under MSP.

ix) There was need to associate Panchayats in agriculture and to encourage agro and food processing industries for improving income of farmers.
3. Land
i) Diversion of agricultural land in areas where urbanization was taking place should be discouraged.

ii) The ceiling surplus land was being acquired by Govt. without any compensation. The farmer should be compensated. When industries were not subject to any land ceiling, why should it be applicable to farmers?

iii) Because of theft and mischief by the villagers, land was sometime being kept fallow by farmers.

iv) Govt. land, which was used as passage/road to the farmers was being encroached. Hence it is not possible to adopt mechanized spraying and other operations which were necessary for high-tech farming.

v) Consolidation of landholding through mutual transfer among farmers may be encouraged as a policy. For this purpose, the stamp duty at concessional rate should be levied by State Govt.

vi) Survey of soil condition all over State be taken up to monitor soil health and to determine proper and balanced application of fertilizer.

4. Water
i) The women & tribal farmers emphasized inadequate irrigation facility which should be increased through small projects like cross-check dams on nullas.

ii) Water distribution as per practices under CADA should be ensured in irrigated land.

iii) The rainwater harvesting techniques and percolation tanks constructed by the farmers have improved water availability for farming. But it needs investment and is difficult for small farmers.

iv) Irrigation ponds and bunds should be protected from encroachment by mischievous elements and these should be maintained with help of local administration.

v) Water Management system in watershed areas involving Farmers’ Committee be encouraged.
vi) Minimum distance between two tubewells should not be insisted upon since it prevents poor farmers from having access to water.

vii) Chhatisgarh in spite of heavy rainfall and number of rivers has highly inadequate irrigation facilities. Bigger irrigation projects be constructed on rivers.

viii) Advice for sowing ‘suryamukhi’ was given by Agriculture Deptt. but in the last two months, the irrigation water was stopped by Irrigation Deptt. There should be coordination between extension agencies and Irrigation Deptts.

ix) In absence of proper water management system, no diversification from paddy is possible. Chhatisgarh Govt has enacted law for formation of water users’ committees, which would regulate and ensure proper water management system. It is being implemented in a phased manner.

5. Technology / Extension/Research

i) The livestock policy to improve indigenous milch animals was adopted by the State Government. Farmers can choose type of frozen semen as per their need. Local ‘Sahiwal’ cow can yield 15-16 litres of milk and it can be upgraded to 25 litres with frozen semen from improved Sahiwal bulls.

ii) Only about 15% of agriculture extension staff were capable of giving quality advice and extension service to farmers. They need refresher training. Conscious farmers may work for extension of technology in rural areas.

iii) Technology backup for recycling of agriculture waste, as fodder is inadequate and the same was not available to farmers.

iv) Potato seed is not available and was costlier in Raipur since production facility was not available in the State.

v) School teacher may teach agriculture practices to students. This was not being done. The school curriculum may be modified to include agriculture.

vi) Subsidy on improved implements, irrigation works, to the extent of 50% be made available to the farmers for adopting hi-tech agriculture.

vii) Farmers should be taken into confidence by Government while implementing projects/ schemes.
viii) Agro forestry in suitable areas may be taken up for benefit of farmers particularly in highland areas to optimize farm income. In some villages bamboo plantation had been taken up by the farmers profitably.

ix) A small land holding of 4.7 acres was used for fish seed production, horticulture and animal husbandry by a farmer to get good income with minimum investment.

x) No ICAR institution was available in Chhatisgarh, hampering research activities in the State.

xi) The quality and quantity of technology developed and extent of its adoption should be examined. The inadequacies should be studied.

6. Quality seed and Inputs

i) Facility of natural breeding for milch animals be given in the villages for improving the quality of indigenous cattle.

ii) Livestock was adversely affected due to inadequate pasture land.

iii) Use of organic fertilizer and waste products should be encouraged by Government for use by farmers.

iv) Availability of quality milk animals/ poultry at a reasonable rate with Government assistance was necessary for livestock development.

v) Timely availability of seed inputs and coordination between agriculture scientists and Agriculture Department was necessary for improving productivity.

vi) Cost of pesticides and agro chemicals varies from company to company and the farmers were sometimes misled/ cheated. Uniform price of pesticide should be adopted. There was a need for regulating the price and quality of pesticide/ agro-chemicals.

vii) Punishment for selling spurious fertilizers and pesticides should be more stringent. The culprits were charged under 420 IPC and they were mostly getting away with lighter punishment.

viii) Subsidy in fertilizer was given mostly to the manufacturers. For organic fertilizers, no subsidy was available.
7. Credit & Insurance

i) Central Government’s help to State to extend credit to farmers @ 7% p.a through cooperatives was required. This had not been possible so far in view of the three tiers in the cooperative system with margins to be provided at each level.

ii) A number of farmers complained that adequate credit was not available from banks even after mortgaging costly land.

iii) Complicated procedures laid down by the Banks for availing credit were difficult for the farmers to comply.

iv) Procedure for assessing crop loss for crop insurance was not transparent. The system was faulty and not beneficial to farmers.

v) Premium for crop insurance had been increased substantially beyond farmers capacity to pay. For “Arhar,” 19% premium fixed was not viable for the farmers. As a result the coverage of farmers under crop insurance was not satisfactory.

vi) For crop insurance, village should be the unit instead of “tehsil”.

vii) No relaxation was being extended by bank for restructuring of loan of farmers when it becomes a non performing asset due to natural calamities. Waiver of loan/reduction of interest was not necessary. But timely action to restructure loan when required and adequate credit would largely mitigate the problems faced by farmers.

viii) Emergency consumption loan may be considered for farmers against paddy stock to avoid distress sale when there was slump in the market.

ix) Interest holiday to farmers like “tax holiday” being extended to the industries should be considered by Government.

x) OTS facility be extended by NABARD for agricultural loan taken by farmers from Banks/Cooperatives.

xi) For better access to credit, women farmers be organized as SHG so that the Banks will be encouraged to give loan to the SHGs since recovery of SHG loan is about 98%.
xii) Effective interest rate for agriculture loan from cooperatives in Chhatisgarh is 11% instead of 9% since farmer has to give 15% of loan as share capital without any return, effectively increasing interest rate.

xiii) Warehousing facility was mostly available near urban areas but not in rural areas. Loan against warehouse receipt should be available to the farmers.

xiv) Information to farmers about different insurance schemes is not adequate.

8. **Marketing**

i) Most of the farmers had no access to market and depended on middlemen/dalals who decide the price deriving substantial profit and preventing farmers from getting remunerative price.

ii) Training programmes conducted by Government on agriculture/cropping did not highlight the problems of marketing. Extension machinery did not have an understanding of markets for explaining to the farmers.

iii) No processing facilities were available due to inadequate infrastructure and the benefit of processing of agro products was going mostly to the traders and not to the farmers.

iv) Organic farming/produce cannot be sold in cities due to inadequate facilities like a certifying agency in the State. Chhatisgarh Government is discussing with APEDA to have a certifying agency set up at Raipur.

v) MSP for paddy was increased only by Rs. 10/- per quintal last year which is negligible compared to increase in the cost of input. The basis for deciding MSP is not transparent.

vi) Prices received by farmer were not remunerative. Even a graduate farmer with 12 acres of irrigated land farming for 20 years has left it this year due to increased cost compared to the prices of produce.

vii) “Mandis”/markets for agriculture should be well equipped and connected with other markets to maximize returns to farmers.

viii) Three tier cooperative marketing structure as in case of marketing of milk (NDDB pattern) may be implemented associating the farmers.
9. **Suggestions made by the State Government**

The State Government stressed that in view of rain-fed rice cultivation, there was water stress at different growth stages in rice and water logging in the initial vegetative stages of every crop. Rain water harvesting and recycling and crop diversification in fragile rice growing environment was, therefore, necessary. *Biasi* system of rice cultivation in Chhatisgarh has been prevalent since a very long time and in view of the agro climatic conditions, it cannot be replaced easily. It has inherent defects – high seed rate, greater water loss through percolation leading to drought at terminal stage etc. *Biasi* operations cannot be done without standing water of at least 5 cm depth. The general definition for drought did not apply to rain-fed rice under the *biasi* system and hence Chhatisgarh does not get full benefit of drought relief. Farmers have low risk bearing capacity in view of mono cropping in the light of agro climatic conditions. A separate credit policy was, therefore, needed for the State. Large scale migration needed to be checked through better employment opportunities after the rainy season, increase in double crop area and other activities like bee keeping, sericulture, mushroom cultivation etc. Chhatisgarh is already giving importance to farm ponds and roof water harvesting and enjoys an advantage since each rice field also works as recharge pond. Chhatisgarh State Biodiversity Board would be working on detailed guidelines for protecting the rights of farmers in their various roles. It was pointed out that in Chhatisgarh, rice was grown under broadcasting *biasi* system whereas most of the dynamic crop simulation are made for transplanted rice with high inputs. It was necessary to develop dynamic crop simulation programmes for directly seeded *biasi* system.

Government of Chhatisgarh further indicated that they had planned to take up measures like crop diversification, increasing cropping intensity, organic farming, agro-forestry, strengthening of soil testing laboratories, fodder and cash crops and promoting agro-based industries for development of agriculture. Traditional and nutritive crops of Chhatisgarh like kulthi, kudo-kutki, kesri daal etc should be procured under PDS especially since “Pratik” variety of Kesri daal had only 0.6% toxicity. It also suggested that scope of fishermen welfare insurance be extended and subsidy component be increased. Another suggestion was that research in agriculture needs reorientation for
small farmers and should utilize traditional agricultural knowledge available with the farmers. Policy be reoriented to establish linkages between common property resources, livelihood support system and traditional institutional arrangements. Policy should also encourage rainwater harvesting. Employment opportunities should be improved through vocational training.

10. After the Consultation session, Members of the NCF assured the full consideration of the suggestions and written representations made by the State Government and participants. They also thanked the State Government for the courtesy shown.
STATE LEVEL CONSULTATION OF GUJARAT FOR FEED BACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT AHMEDABAD ON 15th JUNE, 2006.

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Ahmedabad on 15th June, 2006. The NCF was represented by Shri Y.C. Nanda, Member, Dr. R.B. Singh, Member and Dr. Deepak Rathi, Research Officer. Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

2. General Observations and Suggestions

i) A large percentage of the rural households are landless and also assetless. As they also did not have any vocational skill/education, they were therefore not likely to benefit much from the growth of the economy. There may not be any trickle down effect for them unless they had some productive assets or marketable skills. Jobless growth was really joyless growth.

ii) The need was for a rural non-farm livelihood initiative with KVIC and a restructured SFAC as its core to work on a consortium basis as a counterpart to NREGP in the skilled employment sector. It may bring all rural non-farm employment programmes together.

iii) An effective and efficient delivery system was an important pre-requisite for improving our agriculture. Delivery system constraints need attention. Entire component of the delivery system [non-plan] needs to be supported. The staff needed retraining/greater mobility and more knowledge, as knowledge was likely to play an important role in future.

iv) Most of the recommendations of the NCF were laudable but the question was as to who would fund those.
v) Budget for agriculture needs to be increased particularly at the State level as agriculture is a State subject.

vi) Definition of the farmer as proposed in the draft policy covers different groups, which require segregated planning including different new policy packages.

vii) Scale is important in agriculture and inefficiency should not be rewarded. However, marginal and small farmers needed to be protected and supported.

viii) The farmers need education/training in every aspect of farming including marketing to face the challenges of modern diversified commercial farming.

ix) There is need to involve more educated youth in farming. Rural non farm activities needed to be enhanced.

x) Day to day weather report should be made available to farming community on a regular basis.

xi) Poor electricity supply is a serious contraint.

xii) There is a need to promote VKCs.

xiii) The State is fortunate to have no farmer suicide.

xiv) The time of telecast of programmes on agriculture should be shifted from 6.00 pm to 7.00 pm for the benefit of the farmers. Serials should be prepared on agricultural activities. Need for a 24 hour Kisan Channel.

xv) Private persons should also get the benefit of Indo-US Knowledge Initiative for their capacity building in relevant field.

xvi) Due to the National Commission on Farmers, the farmers have some voice in the country now.

xvii) There is a need for separate budget for agriculture like Railways for giving more emphasis and proper orientation to agriculture under the changing scenario.

xviii) On one hand we have food security related issues and on the other development of the competitive market with free choice; the farmer will go for the crop that will generate more income for him. How are the food security issues to be addressed? There are also chances of cheaper imports of agri-commodities in the present WTO era. The farmers would need support to face these challenges.
Government looks at farming with social angle and there is need to think in the entrepreneurial way. There are eight Agri-Export Zones in the State, which could be exploited for the benefit of the farmers.

Agriculture should be treated as a Central subject or placed in Concurrent List with the changing scenario and implementation of the WTO.

High tech agriculture and horticulture may be treated as industry.

3. Land

i) There was a need to relook at the ‘land ceilings’. Some cultivators felt only 70-80 acre land size was viable.

ii) Land Use Board need restructuring and should be renamed as Farm Use Board and placed under Agriculture Department rather than the Revenue Department as at present.

iii) Land laws need modification.

iv) Consolidation of land holdings was required. The concept that land size should not be allowed to be reduced below a minimum size needs to be examined and introduced in the land laws.

v) Allocate wastelands to small/marginal farmers and their groups instead of corporates.

4. Livestock

i) Some of our best breeds of livestock are being protected under IPR in foreign countries; we should protect our gene heritage. Knowledge and technology growth is very much required; the Agricultural Universities should be funded liberally for research and technology development for the farmers.

ii) Non descript animals are increasing; their characterisation should be made.

iii) Poultry comes under agriculture (activities allied to agriculture) but treated as an industry.

iv) Milk production is stabilised now: The need is to increase it further.
v) Gujarat is rich in animal genetic resources which needs to be protected and disease infestation should be checked. Very little is being done in this direction in an organised manner.

vi) Need to provide doorstep artificial insemination services for the cattle.

vii) Women do most of the work regarding cattle rearing in Gujarat.

viii) Extension system is very weak in the animal husbandry sector.

ix) There is need to give more emphasis to Agriculture Extension and Training in the 11th Plan.

x) Stray cattle often destroy the crops. But certain religious considerations come to the forefront in dealing with, uneconomic cattle and wild animals.

5. Research and Technology

i) There is need to look at organic farming in a holistic manner; organic farming requires more knowledge input than the normal farming system.

ii) Research and technology dissemination may look at the issues connected with the need for increased productivity, efficient input use, quality management, marketing, value addition and processing, diversification in the direction of export oriented crops, waste management, energy management, natural resource management, promotional role of APMC, agri processing and commodity parks, disaster management and improved support systems.

6. Inputs

i) Spurious input supply should be checked and right input at right time and place be made available to the needy farmer. The transport expenses should be kept at the minimum. There is a need to look at farmers in a disaggregated manner in different regions to work out a good delivery system. The prices of pesticides need to be controlled.

ii) Agriculture inspection services need to be established. Use of pesticide should be regulated.

iii) Quality of inputs and its timely supply and prices could be reduced by routing these through linkages with banks, suppliers and farmers.
iv) Need to form one resource centre in a cluster of 40-50 villages.

v) No need of service tax on seed as farmer is also a grower of the seed.

7. **Credit and Insurance**

i) Gujarat inspite of having good growth in agriculture was facing the problem of outreach of the financial system. Only 10 per cent of the farmers were getting credit from commercial banks, 17 per cent from cooperatives and nearly 42 per cent from informal sources. After 40 years of nationalisation of banks and 20 years of credit-targeting, poor outreach was extremely worrisome.

ii) World Bank and NCAER study [2003] showed that in UP and AP, the percentage of farmers to the rural households who could get credit were only 24 and 19 per cent respectively. Loan approval required on an average 33 week time in commercial banks. 27 per cent of the farmers reported paying bribe. The bribe amount ranged between 10 to 20 per cent of the loan amount.

iii) Outreach and quality of credit should be improved with appropriate interest rate. Inefficiencies of the delivery system should not be loaded on the farmers and Government may provide subvention if the interest rates were to be kept lower than the economic rates.

iv) Farmers also need credit to meet emergency expenses as also for consumption expenses as their incomes are seasonal. The banks could consider devising suitable schemes to meet these credit needs within the overall repaying capacity of the farmers.

v) Banks need to develop new schemes to meet credit needs of the farmers for switching over to higher productivity levels, new economic activities, value addition and new technologies.

vi) The crop insurance premium for cotton crop was very high.

vii) Agriculture is high-risk activity; proper crop insurance scheme is needed. The crop insurance in the present form is not farmer friendly and the government is also incurring large liability every year. Inspite of the above, the farmers are not satisfied. This needs revision. The farmers also need insurance for covering
market risks, which have increased considerably in shifting from subsistence farming to commercial farming.

viii) Medical expenses are increasing. An affordable and effective system of rural health insurance is needed. The primary health service should be improved.

ix) Farmers want quick cash after the harvest. In absence of adequate storage arrangements and problems in negotiability of warehouse receipts, pledge finance has not developed. Banks need to innovate and consider providing finance against produce stored at farmer’s house.

x) There was a need for an Agriculture Risk Fund to take care of the risk materialising in agriculture lendings by banks.

xi) The scale of finance for different crops should be realistic and revised regularly.

8. Cooperatives

i) The cooperatives appear to be the most effective way to reach the marginal and small farmers. However, there is a need for reforms in the cooperatives. These should be professionally managed with clear demarcation of duties and responsibilities between the officials and the Board of Directors. Audit and accounts need improvement

ii) Recommendations of the Vaidyanathan committee for revitalisation/recapitalisation of credit cooperatives should be implemented quickly.

9. Marketing

i) How to produce, when to produce and where to sell should be answered and integrated with market for the benefit of the farmers.

ii) Need to give more attention to remunerative prices for the farmers for their produce. APMCs and State Marketing Boards should understand their new developmental role. There was a huge scope of improvement in existing working style of the APMCs.

iii) Hamal and coolie do not deal with farmers respectfully; rather they insult them. Farmers selling their produce in APMC feel that the traders and management
connive and often cheat them. There is need for a greater say of farmers in managing the APMCs and a say particularly in the auction system. The farmer’s interest should be uppermost in the working of the APMCs. Ungraded produce fetches low price. The need is to introduce grading at the farm gate itself.

iv) Increase in farmers’ income is most important and for that making him secure in the marketing field is essential. Insurance to cover market risk does not really exist. Vulnerability on this account will continue to be there unless some mitigation mechanism is put in place.

v) At present farmers do not get sufficient return from grading but they are doing this only because of their reputation for supplying quality material in the market.

vi) With entry of big corporates in agriculture and related areas, it would be essential to ensure that the interests of the farming community are protected.

vii) There is a time lag between picking to export of cotton produced by the farmers. During this period they feel shortage of money at one end due to expenses incurred in ginning, grading and getting international certificate regarding quality of the cotton and on the other they don’t have money as they are not selling cotton; therefore to promote export of cotton, funding for the period mentioned above should be provided to such farmers for meeting day-to-day expenses.

viii) Storage facilities should be provided to the farmers at cheaper rates so that they can keep their produce in the godown and avoid sale during the glut period.

ix) Informal contract farming is taking place in the State. It is necessary that a suitable farmer-centric code of conduct is decided at the earliest. The present arrangements are rather fragile.

x) The Government should provide subsidy to farmers for processing, transportation and value chain management.

xi) According to the changing scenario in the marketing of farm products there is need to implement the Model APMC Act in all the States. Demand driven export oriented mega markets must be established to increase the income of the farmers.
xii) There was a need to promote the National Agro Product Futures Exchange by APMC etc with membership of all APMCs.

xiii) Need to develop farmers’ markets so that farmers could market his produce directly to the consumers.

xiv) The traders take benefit from MSP by procuring production of the small/marginal farmers at low price and then sell it at MSP. Value addition at farm gate level is required.

10. **Women in Agriculture**

i) Special treatment should be given to the women involved in agriculture activities. There is a need to form more women self help groups.

ii) Women capacity building and skill development is urgently required.

iii) Women do not get land titles and also find it difficult to access services including credit from banks.

11. After the Consultation session, Members of the NCF assured the full consideration of the suggestions and written representations made by the State Government and participants. They also thanked the State Government for the courtesy shown.
STATE LEVEL CONSULTATION OF HARYANA FOR FEEDBACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT CHANDIGARH ON 25\textsuperscript{th} AUGUST, 2006.

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Chandigarh on 25\textsuperscript{th} August, 2006. The NCF was represented by Dr. R.B. Singh, Member, Shri G.C. Pati, Joint Secretary and Dr. Deepak Rathi, Research Officer. Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

1.2. Mrs. Asha Sharma, Principal Secretary, Agriculture, welcoming the participants explained how farmers of Punjab and Haryana had taken leadership in making the country self-sufficient in food grain during green revolution. But now farmers of Haryana are adversely affected due to stress on natural resources on account of green revolution. Government of Haryana has adopted the strategy of diversification of agriculture to tackle the problem.

1.3 On request of the Principal Secretary (Agriculture), Shri Surajewala, a former senior Minister of Haryana and presently a Member of the Legislative Assembly of Haryana and President of the Bhartiya Kisan Sabha (Haryana), a person with several decades of association with farmers and himself a farmer, gave the following account and status of farming and farmers of the State:

i) A good number of farmers, including landless farm workers (a detailed list was provided), several in the age group of 20-45 years, have committed suicide in the last few years, a phenomena unknown 15 years ago. This was primarily due
to the increased indebtedness because of the low or negative income of the farmer.

ii) The overall Human Development Index in Haryana has gone down and people are even losing their culture and identity. The level of education, especially the technical education, was one of the poorest in the country.

iii) Some of the best livestock genetic resources of the country such as Murrah buffaloes are being lost rapidly due to poor policy of livestock marketing. The three major ICAR Livestock Research Institutes, namely, (i) National Dairy Research Institute, Karnal; (ii) Bureau of Animal Genetic Resources, Karnal and (iii) Buffalo Research Institute, Hisar, should ensure the conservation of the rich livestock biodiversity of Haryana.

iv) The present price policy has been defective and it was requested that a Regional Agricultural Prices Commission, comprising a good number of farmers, should be established to look into the input and output balance in the North West region, which is different from those in other regions.

v) Haryana being a major exporter of Basmati Rice, the Basmati procurement prices should be delinked with other Government-supported prices as export of Basmati Rice is the main foreign exchange earner amongst the agricultural commodities of the country. The price suggested by the CACP is generally unfavourable for farmers; hence the methodology of price calculations should be improved. There is good scope for promoting export of organic Basmati.

vi) Unthoughtful promotion of new crops has resulted in almost complete elimination of some of the very important crops such as, Chickpea (Gram) and Guar.

vii) The prevalent rice - wheat cropping system has resulted in serious fall in water table, thus has adversely affected the water quality as well as the cost of water pumping.

viii) The flow of credit to the poor farmers is highly unsatisfactory and majority of the farmers take loans from private moneylenders at the interest rate of about 35-40 per cent. The problem is further aggravated due to spurious seeds, fertilizers and pesticides.
ix) Most of the agricultural credits in the States are unemployed yet reluctant to take to farming resulting in social problems.

x) The loaning by the formal institutions in Haryana is relatively at high rate of interest of 12-14 per cent whereas the Central Government has declared agricultural loaning 7 per cent against 4 per cent interest rate recommended by the NCF. The subsidy should be given direct to the farmer.

xi) The agricultural research has been sluggish as high yielding varieties of oilseeds and pulses been released in recent years.

xii) The Government Departments work in isolation; hence there is poor extension services and technology transfer. Further, public-private partnership is also poor.

2. Land

i) Land record should have the name of woman farmer since she was totally involved in agriculture.

ii) Survey of status of land, its use and facilities should be conducted and computerized.

iii) A farmer should be considered a small farmer for land holding up to 4 ha against the existing limit of 2 ha.

iv) Land Reforms should allow lease of land by marginal farmers to other farmers to improve viability of farming. Land consolidation should also be undertaken. Fragmentation of holdings goes on unabated and 10 to 15% of the farmers have disposed off their tiny land pieces and of the farmers have become landless labourers.

v) Adequate soil testing laboratories should be made available in the State.

vi) Diversion of prime agricultural land for industrial purpose was mentioned as a critical issue. Waste land be developed by industry, part of it given to farmers, rest be used by them.

vii) About 15% of farmers in Haryana were reportedly landless and unviable.

viii) Land in some cases was lying fallow and uncultivable. Land development be taken up with govt. funding and may be recovered from farmers without interest.
Problem of land consolidation be sorted out since land holding was more fragmented.

Productivity has reduced even after using higher quantum of fertilizers due to degradation of soil. Organic manure should be provided so that ‘organic farming’ can be taken up in a big way.

Law should provide vertical development like multistoreyed buildings to minimize division of prime agricultural land in urban areas.

In order to discourage excessive use of urea & DAP which adversely affects soil fertility, the subsidy on urea/DAP fertilizer should be withdrawn or reduced.

3. Water

Depletion and deterioration of quality of ground water level in Haryana was stated to be a critical factor that would influence farmers adversely. Subsidy of 40 to 50% for drip and sprinkler irrigation project as well as for other implements should be given to farmers.

Water shortage, particularly for drinking water was mainly due to expansion of urban areas which should be prevented and villages be developed.

Groundwater level varied from 20’ to 150’ in the State. Cost of irrigation is higher where level is 150’. MSP should take into consideration this higher cost.

Industrial waste from industries should not be drained out the River; since it may cause harm to organic farmer.

For utilization of drip irrigation properly, skill was not available in Haryana. 50% of fertilizer can be saved with drip/sprinkler irrigation if properly used. Need for training and skill development in this aspect was highlighted.

Out of loan for tube well about 40% was wasted as commission or excess expenditure. Hence subsidy was not benefiting farmers.

Rain water harvesting from roof of Government building should be taken up first to popularize it.

Drip irrigation in plain and hill regions should be promoted to conserve water.

Water be treated as national asset. Scientists should evolve new seed to utilize saline water and inferior water.
x) Along with rice Haryana was also selling its water and natural resources to other State in shape of food grains.

4. Livestock and Fishery

i) Livestock was highlighted as an important asset for women farmers and landless labourers as it supplemented the household income of family preventing extreme steps like suicide.

ii) Apart from food & fodder, health care facility for livestock was stated to be a critical problem area.

iii) Problem of stray cattle should be tackled. Stray bulls should be castrated.

iv) India has one-third of World’s cattle population with per animal yield being lowest in the world. Per capita milk consumption was also lowest.

v) Livestock and fishery had to be adopted along with cropping in order to improve income of the farmers.

vi) Birth and death of indigenous and other livestock and animals should be registered to facilitate conservation of indigenous breed.

vii) Farmers with livestock should be covered under milk route for higher income and security.

viii) Social security for farmers should be at the same rate as per class IV government employees.

ix) Numbers of farmers have fish pond along with agriculture farming. Integrated farming has more benefits with less risk.

5. Technology

i) Law must be in place to punish the companies supplying fake or spurious inputs to the farming community.

ii) There is a need to establish technological parks where new technologies for value addition could be disseminated to the farmers was highlighted.

iii) Biodegradable mulching is required instead of plastic mulching to protect the environment and flora and fauna of the soil microclimate, as well as for increasing carbon content of the soil.
iv) Budget under research head should be increased so that new technologies would be developed for the benefit of the farmers.

v) Technologies like zero tillage for conservation agriculture must be generated and replicated.

vi) Vegetables should be given due importance in the National Horticulture Mission.

6. HRD and Education

i) Need for education in rural areas was stressed since it will create off farm employment opportunities for farmers for improving livelihood security.

ii) A large number of Agriculture graduates were unemployed. They may be given dealership for fertilizers/pesticides.

iii) Kisan Call Centre “1551” number should be accessible from the mobile phones also.

iv) Government should fund visit of farmers to other states and to other centres to train in new technology.

v) Technical guidance in proper use of fertilizer, land etc to farmer through Farm Schools should be provided.

vi) Training in vegetable/ fruit nurseries and other allied agriculture and agro processing should be imparted to the youths through KVKs.

7. Credit and Insurance

i) Private moneylenders dominate over institutional sources in terms of share of credit disbursement and they charge the interest up to 30 to 40 per cent per annum. A Law should be in place to regularize the moneylenders and to cap the rate of interest, may be around 12 per cent.

ii) Insurance should not be done on village basis but on unit area basis because many a times there were losses in a set of fields but some other farmers may harvest good crop.
8. **Market**

i) Original quality of ‘Basmati’ was restored after introduction of organic farming. “Organic Basmati” was profitable with no disease, for which sustainable certification facility should be available within easy reach of the farmer.

ii) Setting up of Farmers Clubs was reported to be beneficial.

iii) While finalizing MSP, cost of implements, irrigation etc should be taken into account. It should be linked to wholesale price index.

iv) Increase of MSP would result in increase in consumer prices and may not be politically acceptable. Hence subsidy in the cost of implements, credit, electricity etc. should be given. Credit at nominal cost should be allowed to farmers. Alternatively higher MSP should be allowed.

v) Monopoly trends in procurement of agricultural produce due to permitting large corporate houses to take up procurement should not be allowed since after 2/3 years, the industry may exploit both the farmer and the consumers.

vi) For ‘Contract farming’ Government should be the third party to contract and a sound dispute resolution mechanism be specified.

vii) Agro-processing units be promoted, particularly for medicinal and aromatic plants since it would attract youths to farming.

viii) MSP should be changed to Minimum Remunerative Price (i.e. MRP) and be linked to price index to give assured income to farmer and no subsidy would be necessary for agriculture. MSP should be different for different regions.

ix) In ground water stress area, heavy water consuming crops like paddy should be banned. Summer paddy should also be banned.

x) Crop insurance scheme should incentivise and reward crop diversification efforts in different areas.

xi) No trader should be allowed to purchase in “mandi” at a price less than approved MSP.

xii) Facilities for grading packaging, sorting necessary for diversification should be in place.

xiii) Instead of giving subsidy to farmers market should be developed with skill development training in value addition in farmers’ backyard.
xiv) Elimination of middlemen in marketing of agricultural produce (arthiyas) should be ensured.

xv) Food cooperative stores/shops for sale of SHG Horticulture and other Products should be set up by State Government in each Block.

xvi) Higher MSP for basmati rice should be notified by Govt. of India.

xvii) Veterinary medicines should be sold at MRP.

9. **Suggestions made by the State Government**

After the Consultation, the Member, NCF had discussion with Hon’ble Minister for Agriculture, Haryana in presence of officers of State Government where following views/suggestions were given:-

i) In view of amendment of succession law giving property right to women, the land held by women should be considered separately for ceiling as per Land Reform Act.

ii) Processing and storage facilities should be set up for fresh water prawn which has excellent potential particularly in salinity affected land in the State. About 3.50 lakh ha of water-logged land in the State should also be converted to fishery.

iii) A regulatory framework for controlling and testing the bio products in the market to prevent sale of spurious products should be in place.

iv) Movement of farmers from primary to secondary/tertiary sector should be facilitated for improving their income.

v) Food security should not be a burden on farmers. Areas which can be taken up for food grain production be identified by Government of India.

vi) There is need for preservation of indigenous genes and seeds for developing genetically modified seeds by ICAR institutions for benefit of the farmers.

vii) In livestock production maintenance of phytosanitary standards for international markets should be ensured. Livestock insurance should take care of reproduction losses.
viii) NFDB and National Agriculture Authority should have a representative from every State and a few farmers engaged in inland aquaculture.

ix) Water should be declared a national resource. Efficient use and conservation of water should be the focus of research and technology.

x) Sprinkler and drip irrigation system should be encouraged.

xi) Government of India should assist State Govts. in setting up of State level Institute of Plant Genetic Resources and for developing DNA Fingerprinting of selected crops.

xii) New wheat variety should be developed to withstand higher temperature in February.

xiii) A law to ensure MSP at full economic cost of production and profit should be enacted by Parliament.

xiv) For women, small and marginal farmers subsidy element under various central schemes should be increased to 75%.

xv) State bio-security units must be set up in all States.

10. After the Consultation session, Members of the NCF assured the full consideration of the suggestions and written representations made by the State Government and participants. They also thanked the State Government for the courtesy shown.
STATE LEVEL CONSULTATION OF HIMACHAL PRADESH FOR FEEDBACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT SHIMLA ON 26th MAY, 2006.

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Shimla on 26th May, 2006. The NCF was represented by Shri Atul Sinha, Member Secretary, Shri Y.C. Nanda, Member and Ms. Mamta Shankar, Director. Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

2. General Observations and Suggestions

i) A Separate Policy for Hilly Regions is needed.

ii) Awards for farmers should also be instituted at the Gram Panchayat level.

iii) Farmers should get facilities and incentives, which are available for the small-scale industries sector.

iv) A State Commission on Farmers should be set up with farmers as members. The Commission should submit bi-annual Report to the State Assembly.

v) Agriculture, especially marketing should be made a concurrent subject under the Constitution.

vi) Central projects should take local conditions into account before setting conditionalities.

vii) Community Development Programme is destroyed and the line Department’s control has not helped farmers much.

viii) H.P. can’t use heavy fertilizers adequately since top soils are thin.

ix) There is a problem in extension since there is a ban on recruitments and old staff is retiring.

x) Farmers should be awarded by Padma Awards to encourage them.
3. **Land**

i) Two-third area in Himachal Pradesh is with the Forest Department. Substantial proportion of this land is unutilized. It is either encroached or is in the form of wasteland for which Forest Department has no road map.

ii) There is no focus on farmer or fodder in the Himachal Pradesh forest policy.

iii) People should be associated in the management of forests.

iv) Fodder varieties should be planted in afforestation programmes.

v) Land Use Board should be with Planning Department for better coordination and acceptability.

vi) Industry should not be promoted at the cost of agriculture. Agro-based industries would be more appropriate for promotion.

vii) Urban expansion under schemes like ‘Rajiv Gandhi Urban Renewal Mission’ should not be at the cost of agricultural land.

viii) There should be a law on constructing houses and drawal of water, since these have a major impact on Agriculture.

ix) Size of landholding is getting smaller and land is getting fragmented.

x) Nearly 80% land holding is small. There is need to diversify into multi livelihood options, through non-farm/off farm activities and mixed farming under the guidance of specialists and with adequate training.

4. **Water**

i) Forestry and irrigation departments should have been invited to participate in the Consultation.

ii) In Himachal Pradesh only 18% of cultivated area is under assured irrigation. Retention of water is therefore critical. Under Horticulture Technology Mission an incentive is given for water harvesting structures and there is a good demand for these structures from the farmers.

iii) Different rate of subsidy was given by different departments for water harvesting structures, confusing the farmer. These should be harmonized.
iv) In upper reaches, melting snow and glaciers could be harvested with the help of check dams and shrubs.

v) Water recharging should be made compulsory at village level. Ear marking of common land (100 canals) for water recharge should be made compulsory.

vi) A boom in the construction of industrial, commercial and residential projects has placed a huge and unsustainable demand on the water resources.

vii) The drainage systems constructed by PWD etc. usually terminate in farmer’s fields resulting in flooding of these farms in the rainy season. There should be separate provision for this purpose.

viii) There is a need for strengthening and enhancing irrigation especially lift irrigation.

ix) Micro hydel projects are retarding recharging projects. They also do not allow for storage reservoirs.

x) Before diverting water through tunnels, farmers should be consulted and cost/benefit should be weighed.

xi) Farmers should be involved in water management.

xii) Water should be a community property and managed by local community. The government should bear the cost of water management.

xiii) All rivers should be nationalized and managed by a National Water Authority.

xiv) Rainwater harvesting should be encouraged especially in hill areas.

xv) In case of nationalization of water, the originating State should have the first right on hydel generation.

5. **Climate Change and agro meteorology**

i) The frequency of storms, hail and untimely rains have increased. Snowfall has decreased. The weather has become perceptibly warmer and apple no longer grows below 8000 ft. The production of apple has declined.

ii) Calamity Relief Fund guidelines need change to provide substantial help to farmers. Compensation under Calamity Relief Fund should be given to the farmer directly.
iii) Weather monitoring centre is ineffective and farmers do not get timely information.

6. Livestock

i) No attention is being paid to stray and unproductive cattle. Government should be responsible for them and treat them as resource.

ii) Scientific management of pasture land is required.

iii) Policy for migratory livestock is required.

6.1 Livestock Feed

i) There is a ban on green felling leading to shortage of fodder.

ii) No single agency has taken responsibility for fodder supply.

iii) The Government is providing the feed for trout fishing at present but the quality is not guaranteed and the supply is also insufficient.

7. Fisheries

i) Trout farming is a good source of income and it should be promoted among more farmers.

ii) Trout culture is very costly and risky too, unfortunately a subsidy of only Rs.7,000/- is available for an investment of Rs. 1 Lac.

iii) The level of subsidy should be increased especially in hill region where trout can be an important source of livelihood and employment.

iv) Hill farmers have specific training need but presently there is no Institute in the country where farmers as well as extension workers could receive training in latest techniques in hill area fisheries.

v) There is no assured market for trout.

vi) Since trout farming was risky there was a need for insurance for protection against flood/ poisoning.

vii) The electricity and water rates are charged at industrial/commercial rates, whereas rates applicable for agriculture should be applicable.
viii) The micro-hydel projects were also destroying trout farming by obstructing the flow of the rivers and churning of beds. The entire riverine water is sucked through a trench weir.

ix) No allocation of water is made for fish ponds in irrigation projects.

x) Centrally sponsored schemes for fish reared in plains have provision for first year input subsidy. No such provision is there for cold water fish in the hills where expenditures could be substantial in view of the specialised nature of trout and mahseer.

xi) Natural fish breeding grounds are being destroyed by road construction and micro hydro project.

xii) University and premier research institutions involved in research in fisheries should develop artificial seed production technology.

7.1 Fish seeds

i) No seeds are available for stocking of reservoirs.

ii) Narrow view is taken as environmental issues leading to a set back in seed multiplication.

iii) Quality control of fish seed is very important.

8. Research and Extension

i) Pesticides Sales license should be given only to agricultural graduates.

ii) SAUs should be strengthened. Research efforts are inadequate and no benefits are accruing to the farmers.

iii) Micro-survey is needed to decide what to grow if there are frosts.

iv) SAUs are in dire need of funds.

v) Vacancies of extension staff should be filled.

9. Organic Farming

i) Organic farming was advantageous in the hill States where there was a danger of contamination of the water bodies by excessive use of chemical fertilizers.
ii) Animal Husbandry was very important for organic farming and it was claimed that a single cow could give profit of Rs. 50,000/- against the supply of organic manure and cow urine which was used as pesticide.

iii) Organically grown peach had a longer shelf life.

iv) Awareness should be created to encourage good practices in organic farming. For this purpose training was required.

v) Chemical fertilizers were subsidized whereas no such subsidy for organic manure was available. On top of it 8% VAT was charged on organic manure from other States. Use of organic manure should be subsidized.

vi) Government should provide financial assistance for organic farming and bear the certification cost (At present Morarka Foundation was helping in certification).

10. Horticulture

i) Productivity of apples is very low compared to Jammu & Kashmir. Most of the apple varieties grown are at least 100 years old. Whereas Jammu & Kashmir has introduced new varieties, new varieties have been only recently imported from US. The State government is carrying out high density plantation in upper reaches for testing purpose.

ii) Apple is also grown on wastelands with the help of the area expansion scheme of NHB.

iii) Soil health in horticulture orchards is declining. Nutrient replenishment is required.

iv) KVKs are needed in each district. Farmers should be given professional and business orientation.

v) There is a need for Horticulture Price Commission and a Market Intervention Scheme in years of excess production to protect farmers from price crash. Every State should have a Horticulture Produce Board, to take care of marketing needs in view of the highly perishable nature of horticultural commodities.

vi) National Horticulture Mission should provide adequate assistance.
vii) With so many research institutions and universities there should be no need for importing varieties from abroad.

viii) Subsidy should be given on ‘made tea’ from Kangra region. Subsidies will also encourage the production of diversified products like chantelli and beer.

ix) Due to liberalizing of trade, a niche market catering to the rich has come up for imported apples. However imported apples coming into India are waxed which is banned in the world. The local Kinnaur variety is of superior quality but is not fetching high prices.

x) Imported fruits have the advantage of heavy subsidy in their countries of origin, window dressing and packaging.

xi) Small farmers do not have export permits//licenses. Efforts to take up the matter with Commerce Ministry have been in vain.

11. Inputs

11.1 Seeds

i) The Agricultural Universities should produce good quality root stock.

ii) There is a problem of shortage of good quality seeds/sapling faced by Nursery Growers. This should get a thrust in the National Horticultural Mission.

iii) There is a need to grow new varieties and carry out location specific research. We must develop our own varieties in order to fetch good prices and compete globally.

iv) Germplasm Bank and Root Stock Banks should be established.

v) Nursery growers are neglected in the horticultural policies. Multi-nationals are taking major benefits of seed production by farmers.

vi) The provisions under the proposed Seeds Act 2002 proposing that no farmer should keep his own seed, are unacceptable since this would only benefit seed companies.

11.2 Implements and Tools

i) Women farmer friendly tools and implements suited for small farms in hill areas should be designed and distributed.
11.3 Soil

i) Soil has been extensively exploited and its health is precarious. It has stopped responding adequately to chemical fertilizers.

ii) Soil mapping should be carried out with proactive advice to farmers on crops to be sown.

iii) The fertilizers usage is unbalanced in favour of Nitrogen. Due to poor extension, MNCs were dictating usage. The research is slow and does not percolate to the grass-root level.

iv) Subsidy on Nitrogenous fertilizers should be reduced and subsidy on potassium and phosphatic fertilizers should be restored to improve soil quality since the requirement of nitrogen in the soil could be met by Vermi compost etc.

v) Top soil is thin and heavy fertilizers are generally not effective.

vi) Cost of organic inputs is higher compared to NPK. There should be a subsidy on organic inputs.

12. Other Support Services:

Rural Infrastructure

i) Roads are essential for rural infrastructure and more money needs to be allocated for building roads in the hilly regions since cost of laying roads is higher.

ii) Small apple farmers do not have holding capacity for their produce. Their marketing efforts should be supported.

iii) Transport costs are very high in hilly and tribal areas.

iv) Cold storage and cold chain infrastructure is required. Cold storage should come up in production areas. At present the subsidy on setting up cold storage has been taken by the middlemen in cities and the cold storages are located there (the State Government has recently asked the Adani Group to set up seeds stores and cold storages near the orchards. The Group will buy directly from the farmers and will do the grading, packaging etc. so that the farmers will be spared these costs as well as the inflated costs of the transporters. Reliance is also
expected to participate in a big way. A model code of conduct for arrangement between farmers and companies had been drawn up by the State Government.

v) Department of Fisheries should have a refrigerated van for transporting fish.

13. Credit & Insurance

i) Role of Banking Institutions was painted in very poor light.

ii) Farmers found it very difficult to approach the banks due to commission, harassment and corruption. This along with cumbersome paper work had forced borrowers to resort to borrowing from moneylenders at very high interest rates or resort to microfinance by forming Self Help Groups [SHGs].

iii) Too much land is being asked as collateral even for small loans.

iv) Loan should also be given for consumption purposes. Status and the repayment history of the borrower should be taken into account.

v) Processing charges should be waived.

vi) There is very little institutional finance for Apple growers. Middlemen dominate the financing.

vii) Rates of interest for loans from NABARD are higher and should be brought down especially for Cooperative Banks.

viii) Rate of interest on the agricultural loan should not be higher than that for housing or automobiles.

ix) It should not be mandatory to take bank loans for availing subsidy from the National Horticulture Board.

x) Corruption in obtaining no demand certificates from Banks should be curbed.

xi) A Revolving fund for farmers should be set up, to support them in case of artificial/natural calamities.

xii) Consumption loan should be provided to the farmers by the Banks in order to save them from falling into the clutches of money lenders.

xiii) Insurance is needed for horticulture crops just like cereals/cash crops.

xiv) The premium on agricultural insurance is very heavy. The premium should be reasonable based on crop yield estimation.
There is a problem faced in assessing the losses for insurance purposes. Crop yield estimation methods like crop cutting may not give accurate results.

14. **Marketing**

i) Fluctuating market and non-remunerative prices create difficulties for farmers.

ii) It is felt that there is a huge gap between the prices that the producers get and that which the consumers pay. The proportion going to middlemen should come down. Farmers are harassed by truckers while carrying their produce and have to pay commission in Delhi mandis and they get a raw deal.

iii) Marketing should dictate area wise production plans for deciding what should be grown where. Information regarding spatial and temporal pattern of demand in various parts of the country should be made available for proper production planning and remunerative prices to farmers growing off season vegetables.

iv) Pre and post harvest losses should be cut.

v) MSP should be extended to horticulture crops.

vi) The MIS allocation is too low to permit institutions to really benefit farmers.

vii) The central Price Stabilisation Fund scheme is not a success in H.P. because land holdings were very small. Separate price stabilisation fund is needed for hill states.

viii) Price Stabilization Fund should be established with 1:1:1 ratio between the farmer, State and Central Government.

ix) Due to the scattered settlements and poor road links to interior villages, there is a problem in Marketing of milk and other perishable commodities especially in remote areas.

15. **Women Farmers**

i) Women farmers expressed their appreciation of the Krishak Mahila Samiti Scheme run by the state government.
16. **Agro-tourism**

i) Tourism could be combined with agriculture. Especially orchard tourism has great potential in H.P.

ii) Farmers could also be taken out to visit model farms in the country and abroad.

iii) Model farms are needed in the villages for field visits.

17. **Youth and Agriculture**

i) Every year a huge number of youth join the job market after finishing school; however there is a ban on Government jobs. They could be absorbed in Agriculture if they are trained. Hence, Agricultural training institutes, like ITIs, should be set up to train farmers to enable them to undertake scientific agriculture.

ii) Agricultural University graduates should have compulsory experience/training in villages.

iii) Agriculture University students should not double up as extension staff. The Departments should be doing it. In Himanchal Pradesh Agriculture Department staff was merely working for sale of pesticides and seeds.

iv) Today’s youngster does not see much benefit in agriculture. To attract youth to farming, the cost of farming should be brought down, and its profitability should be increased through better marketing.

v) Our education policy is not farmer oriented. Farmers do not get research support.

18. **Animal Human Conflict**

i) Farmers are threatened by the increasing population of the monkeys, wild boars and neelgai. There is ban on killing/capture and export of monkeys and they are playing havoc with the agricultural and horticultural crops.

ii) Monkeys should be declared “Vermin” under the Wildlife Act.

iii) Laws are needed for protection from wild animals.
iv) Forests should take care of wild life by planting trees which can sustain bears, monkeys etc.

v) Forests Department should plant Crabpine to feed animals and monkeys so that farmers’ crops are saved.

19. **Suggestions Made by the Hon’ble Minister of Agriculture, Govt. of Himachal Pradesh**

Members of the NCF held separate discussions with Hon. Minister for Agriculture, H.P. He mentioned about the problem of Extension caused by substantial number of vacancies due to the ongoing ban on recruitment. He pleaded for consumption loans to be given by credit institutions to farmers to save them from moneylenders. He opined that cooperatives and RRBs had performed poorly in the state and had limited capacity for helping farmers. Bankers did not have appropriate mindset in favour of farmers. He felt that the growth of credit should be studied to see if it had gone for productive purposes. Regarding inputs, he indicated that the top soil in H.P. was thin and it was not feasible to apply heavy doses of chemical fertilizers. Decontrol of potassic and phosphatic fertilizers had led to unbalanced use of nitrogenous fertilizers. While vermi compost was being encouraged by the state, there was a need to provide subsidy for organic inputs in view of their high cost. He also informed that the state was encouraging rainwater harvesting and backyard fisheries. He opined that Agriculture, especially marketing, should be made a concurrent subject. Member Secretary, NCF, thanked the Minister for the courtesy shown to the NCF team.
STATE LEVEL CONSULTATION OF JAMMU & KASHMIR FOR FEEDBACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT SRINAGAR ON 18th MAY, 2006

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Srinagar on 18th May, 2006. The NCF was represented by Shri Atul Sinha, Member Secretary, Dr. R.B. Singh, Member, Shri Y.C. Nanda, Member and Dr. (Mrs.) Laxmi Joshi, Research Officer. Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

2. Hill Farmers and Hill Farming: Agro-Ecologically Differentiated Approach

i) Differential policy for hill farmers for capturing the special and unique physical, ecological, cultural and socio-economic settings in the hills should be carved out.

ii) The State of J&K has four distinct agro-ecological zones, the temperate and cold arid zones being limited to the State which should receive specific R&D support.

iii) The State is rich in biodiversity, particularly in those of fruits, vegetables, legumes, medicinal and aromatic plants. Unique variability exists in rice (glutinous), wheat barley and maize (multiple cobs) which should be conserved and judiciously utilised. In the cold arid zone, Kala Jeera, seabuckthorn, walnut, apricot, flowers, unique possessions of livestock, such as Pashmina
goats and cold fish variations are highly impressive and need to be conserved and commercially utilised. A State Biodiversity/Biosecurity Board should be established which should also address Plant Variety Protection and Farmers’ Rights issues.

iv) Indigenous knowledge, including farmers’ selections of crops and crop species, viz turmeric, walnut, etc. should be scientifically evaluated and encouraged; community conservation and farmers’ rights should be supported and realised.

v) Transport subsidy for achieving price parity in inputs procurement and output delivery among hill and plains farmers should be provided.

vi) Special support is needed for the pastorals and tribes like Gaddi and Bakarwals, who have often been “cheated” in getting access to forest areas and to degraded lands for grazing and raising their animals. Strengthen “grazing rights” of the pastorals. The pastoral tribes and local communities should be mobilised for collection of genetic resources and should be compensated suitably.

vii) To help nomadic tribes, activities like grafting wild ber and planting of amla and citrus fruits on barren forest land should be undertaken and local people should be involved in this.

viii) In Ladakh, only 6 months are available for field farming; the need to store inputs and create grain, seed, fodder and feed banks was emphasised; buffer storing and single window delivery systems should be promoted.

ix) Green House cultivation should be promoted in Ladakh in view of the large number of sunny days there.

x) Solar driers need to be encouraged in Ladakh for dryfruits.

xi) More investments are needed on tubewells rather than canals in Jammu region.

xii) NHB/APEDA should have offices in Srinagar.

xiii) There is only a single road linked to New Delhi which is the most important market for the produce from the State. Blockage of the road due to weather conditions results in losses for the farmers. More road/rail linkage to Delhi should be provided.
xiv) Baramula was earlier a rail head and this facility should be restored.

xv) Diesel should come in as an agricultural input for the State in view of its dependence on road transport.

xvi) Jammu & Kashmir State has niche advantage in May-June due to its varied climate.

xvii) Agricultural Universities should guide farmers on what, when and how for farming, depending on local conditions.

xviii) Farmers should not attempt to grow everything; everywhere otherwise incentives get distributed too thinly and also get dissipated.

xix) All schemes should be regularly evaluated to cull out the non useful ones and focus effort and resource on schemes which are succeeding.

3. Natural Resource Management

i) Given the acute shortage of agricultural land in the State, prime agricultural land should not be diverted to non-agricultural purposes. Land consolidation is essential. The State of J&K was pioneer in registering and allocating land to the tiller – a historical development which promoted equity and reduced poverty, but the Revenue Act is outdated and should be amended.

ii) Rainfed agriculture should be intensified through the National Rainfed Area Authority (NRAA). Forest conservation, forest rejuvenation and transparent forest management are highly unsatisfactory. Command area development, water conservation and community-based land and water management are missing. These shortcomings should be addressed urgently and wells should be dug or recharged at strategic points.

iii) Integrated soil-plant-nutrient management, based on soil/plant analysis, is totally missing. Each District should be provided with at least one soil testing laboratory and mobile soil testing should also be encouraged. The KVKs and ATMAs should play an important role in this context. Soil Health Card should be issued to each farm family and judiciously used for maintaining soil health.
iv) The Land Use Board is non-functional; extension services are equally poor; innovative farmers’ farm field schools should have special usefulness.

v) Soil survey should be conducted in each zone.

vi) Forest wasteland should be identified for growing organic walnut.

4. Technology

i) There is a need to strengthen the Agricultural University and its linkage with public and private sectors for generation and effective transfer of appropriate technologies (there appeared limited interaction between the Agricultural University and the State Government extension and development machinery).

ii) Horticulture Technology Mission has only been partially successful. Projects worth Rs 33 crore, against an allocation of Rs 100 crore, have been submitted for approval. The State should take due advantage of the NHM and prepare itself suitably for the purpose. The State University and Department of Horticulture must work closely, and alongwith private sector, should harness the following opportunities:
   a) Low-cost green houses in the cold arid region.
   b) Management of Cuddling moth in apple in Leh.
   c) Promotion of walnut, apricot and dry fruits as a whole.
   d) Minimum support prices for horticultural produces.
   e) Production and distribution of quality planting materials and seeds.
   f) Exploitation of “off-season” production and marketing of vegetables viz green peas and vegetable seeds.

iii) Fish industry has a bright future. Cold water fisheries should be promoted. Rohu was not doing well even in Jammu, which needs to be investigated. Private fish culture has good prospects for self-employment. Fish disease diagnostic and improved management practices should be promoted.

iv) Livestock, especially goats and sheep, have special role. Despite the huge local potential, over 50% of the meat consumed in J&K is imported from other States.
Alongwith fisheries, this gap should be filled by local production. Buffaloes in J&K have great prospects; efficacy of local vs crossbreds or exotic breeds should be compared.

v) Organic Farming, especially of medicinal/aromatic plants which deserve intense scientific and development attention, including certification and marketing should be promoted.

vi) Quality control of organic manure should be ensured through legislation.

vii) Selective mechanisation was considered strategic for increasing land and labour productivity.

viii) The desirability of developing and introducing hybrid rice varieties in the State should be critically examined.

ix) High tech Green House technology should be encouraged to attract youth to make better profits from small holdings.

5. Credit and Other Institutional and Policy Support

i) Private sector has not been proactive in investment (primarily due to security reasons). The local trained/educated youth should organise themselves into SHGs and establish producer-processing-marketing-consumer linkage. In general, SHGs, both in farm and non-farm sectors, have been active and successful and the approach should be further mentored and supported both by the State and Central Government Schemes. Credit should be readily available also for promoting entrepreneurship which should be duly supported by SFAC and NABARD as youth unemployment is a major problem in the State.

ii) Flow of formal credit to the poor is highly unsatisfactory. Everyone emphasised the need for additional and larger credit and financial support to J&K farmers and farming systems. Kisan Credit Card to each farm family to facilitate access to formal credit was advocated.

iii) The State Government invests the least in agriculture and farmers’ welfare which is a tragic trend. Farmers complained that subsidies provided under
different schemes are rather meagre and they face several hassles in procuring
them.

iv) Quality of inputs is generally poor; there should be faster and more effective
action against adulterators; State Pesticide Board should be created to regulate
quality of pesticides, with a farmer in the Board to safeguard their interest.
Provisions should be made for establishing and operating inputs storages or agri-
clinics at strategic sites.

v) Supply of seed is poor and not on time and there is need for stringent quality
testing.

vi) Because of the dominance of fruits cultivation, the demand for Potash is high,
but its supply is extremely poor. Special attention is called for improving cost-
effective availability of Potasic fertilisers.

vii) Poor governance and the lack of transparency were voiced by most of the
farmers and NGOs; the small and marginal farmers remain neglected; there
should be regular monitoring and evaluation of resources allocations and
outcomes; land tenure and land rights must be rendered pro-poor.

viii) Rural industrialisation should be strengthened to improve off-farm employment
and income security. The NREGP and Bharat Nirman initiatives should be
linked with self-employment of agricultural graduates and other educated youth
and for strengthening infrastructure, especially roads, transport and
information/knowledge connectivity. “Kisan Wani” programme and each village
cluster as a knowledge centre are urgently needed to share technology, market,
price and weather related information.

ix) Institutional systems at grassroot levels, such as Panchayats and Gram Sabhas,
are absent, and the administrative machinery at the block level is defunct.
Necessary grassroot community-based institutions are a must for planning,
preparing and overseeing the implementation of agricultural and other
developmental programmes at village level.
x) Schemes of SFAC/NHB should not be compulsorily linked to credit. Since small entrepreneurs face many difficulties in the bank and would instead, like to invest their own resources for their projects.

6. Marketing, Distribution and Trade

i) Highest attention is needed for linking producers with markets, and ensuring appropriate returns; removal of middlemen; providing cold chains and promoting the use of non-wood packaging materials such as corrugated boxes through higher subsidies in order to bridge the cost differential with wooden boxes and gradual elimination of wooden boxes for packaging in order to save trees.

ii) Linking distant production centres with (proposed) rural market centres; promotion of niche production and markets and branding of the products; other things being equal, promote consumption of local products, including supplies to military personnel and establishments in the region.

iii) High priority should be given to post-harvest, agro-processing, value addition, marketing and entrepreneurial development.

iv) Regional Trade Agreements are hurting the interest of local farmers, and should be reviewed and restructured to meet India’s overall competitiveness. For instance, in case of J&K, the apricot produced in Ladakh is superior to the apricot imported from Afghanistan, but still the Government goes on importing apricot at the cost of the local production and distribution.

7. After the Consultation session, Members of the NCF assured the full consideration of the suggestions and written representations made by the State Government and participants. They also thanked the State Government for the courtesy shown.
1. **Introduction**

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Ranchi on 13\textsuperscript{th} July, 2006. The NCF was represented by Shri Y.C. Nanda, Member, Dr. R.B. Singh, Member and Dr. Ramesh Singh, Research Officer. Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

2. **General Observations and Suggestions**

i) Participants appreciated the draft National Policy for Farmers and felt it was in the interest of the farmers.

ii) It was hoped that the implementation would also be in tune with the spirit in which the Draft Policy for Farmers was prepared by the National Commission on Farmers.

iii) Much greater attention was needed from the Government for the agriculture sector.

iv) Urban elite had no awareness about the plight/problems of agriculture.

v) Jharkhand is ‘Ratna Garbha’.

vi) 80% population of Jharkhand is dependant on agriculture for their livelihood.

vii) Government schemes are centered on people below the poverty line [BPL]. For better results, the Governments should cover agriculture and the related sectors as such, covering people both below and above the poverty line. People who are above the poverty line have capabilities to achieve better results.

viii) The ecology of Jharkhand is the economy of Jharkhand.

ix) Mahua & Karanj plants of Jharkhand have the potential for producing bio-diesel.
x) Sale of fertilizers is in the hands of few dealers who exploit the farmers because of their monopolistic status in their area. The State Government needs to be more active in controlling such practices.

xi) The participation of IFFCO and KRIBHCO should be strengthened in distribution of fertilizers to eliminate sale of spurious fertilizers.

xii) Lac cultivation is an important source of livelihood for people of Jharkhand. Nearly 50% lac production in the country is from the State.

xiii) The programmes of the Grain Banks should be strengthened.

xiv) Need for an integrated approach for all the State and Central Govt. Schemes/Programmes.

xv) Profitability in agriculture is declining.

xvi) There is a need of coordinated approach for solving the problems of the farmers.

3. Soil Health Care

i) Land and soil health problem are the major problems in Jharkhand.

ii) Jharkhand soil is generally deficient in lime and if there is no lime treatment the yields from even high quality seeds remain low.

iii) 25000 Soil Health Cards have been issued to the farmers in Jharkhand. The target is to issue the Soil Health Card to each farmer.

iv) Immediate analysis of soil is essential with the help of mobile soil testing laboratories. This programme should be launched on a national scale.

4. Irrigation

i) Most of the area of Jharkhand is under rainfed farming and it is essential to plan cultivation of those crops which require less water.

ii) In Palamu region, citrus and grape cultivation should be encouraged.

iii) A major programme for Soil reclamation is needed for the State.

iv) In Jharkhand annual rainfall is 1100 mm. There is need of water harvesting and watershed development in a scientific manner. Each farmer should try to harvest rain water.
v) Diesel pump sets are the main source for lifting irrigation water which is costlier than lifting water with electric motors.

vi) Maintenance of check Dam is an important issue.

5. Research, Technology and Extension

i) Field centric approach for development agriculture is essential. Research which is not oriented to solve field level problems is not of much use to the farmers.

ii) Village level approach for appropriate technology is necessary.

iii) There is huge potential for organic farming in herbs/medicinal and other aromatic plants as the State is rich in natural vegetation and is home for of several species [for example, 114 medicinal plant species]. The tribal pockets of the State where no chemicals are used in agriculture could be declared as ‘Organic Zone’.

iv) Crop wise detailed package of practices is necessary for a State like Jharkhand.

v) The State Agriculture Department officials do not appear to be favouring organic agriculture as the productivity levels and production figures which they have to report are quite low in system of organic agriculture.

vi) Jharkhand is capable of producing many horticultural crops. The uplands could be mainly used for developing horticultural crops.

vii) The work of the National Horticultural Mission is progressing well in the State.

viii) The diversity of agro-climatic conditions in Jharkhand should be taken into consideration in formulating the projects/schemes.

ix) Rainfed agriculture is important as only 10% area has assured irrigational facilities.

x) Awareness of farmers about the latest technology of agriculture is rather low.

xi) Integrated farming approach is essential.

xii) Seed replacement rate is only 5-10%.

xiii) There is need for strong extension network in Jharkhand.

xiv) At primary school level the children should be made familiar with plants etc.

xv) There is a lack of extension workers.
xvi) How to retain the youth in agriculture is a serious issue as most of the farmers are elderly persons.
xvii) Rejuvenation of old orchards is extremely important.

6. Credit and Insurance

i) Land passbook should be issued to each farmer.

ii) Backward blocks should be identified for greater focus by the financing institutions.

iii) Outreach of Kisan Credit Card should be increased manifold.

7. Market and Investment

i) Not only marketing of agriculture produce is a problem, the marketing system is also inefficient. The producers get a very small part of the price paid by the consumer. Large profits are made in the supply chain.

ii) There is need for much greater capital investment in agriculture.

iii) Production should be market oriented.

iv) Around Ranchi vegetables like cauliflower & capsicum are available throughout the year. The need is for a good market chain to market these vegetables. The Market Yards should also have facilities for grading, storage etc.

v) Litchi is being grown in Ranchi even before the plant was introduced in Muzaffarpur [Bihar] on a commercial scale. There is considerable potential for developing this fruit crop in the State.

vi) Farmers do not have any trade organisation of their own to articulate their issues as in other trades and industries. Hence their problems are often overlooked.

vii) Product price should be based on input cost with at least a profit margin of 8-10%.

viii) A vegetable export zone should be established in Jharkhand.

ix) Market development without the assistance of Govt. is extremely difficult in the State.

x) Private sector is now becoming interested in entering the agricultural produce market.
xi) The prevailing prices of many agricultural crops often remain below the MSP announced by the Govt. of India. The MSP should be protected.

xii) Transport subsidy is needed for input distribution in tribal areas.

xiii) There should be free movement of lac to strengthen the lac market all over the country.

xiv) MSP of the lac should also be announced.

xv) Soil testing units should be established at KVKs.

xvi) NGO should also be permitted to buy agricultural produce directly from the farmers without going through the APMCs.

8. Shri M.K. Mandal, Chief Secretary, Government of Jharkhand, gave an overview of the current agricultural situation in the State and the future roadmap. He emphasized the need for policy for development of agriculture in the State which should be implemented both in letter and spirit and not merely remain just a document. He regretted that despite 80 per cent of the Jharkhand population being dependent on agriculture, the State has so far given only secondary importance to this vital sector, most of the attention going to industries and minerals. While appreciating the contents and implications of the draft NCF Policy on Farmers for development of livelihood security of the people of Jharkhand, he identified the following aspects for priority action at the State level:

i) Notwithstanding the priority for small and marginal farmers, attention should also be paid to medium and large farmers so that they could serve as role models for small farmers.

ii) Generally, most of the Jharkhand farmers have not benefited from the Green Revolution and still continue to practice traditional methods of cultivation. The thrust, therefore, should be given to the development, identification and transfer of appropriate modern technologies, duly blended with indigenous knowledge, and by emphasizing integrated use of chemicals and organic products throughout the producer-consumer chain. Agricultural Renewal (as highlighted in the NCF Draft Policy) should earnestly be started during 2006-07
and Birsa Agricultural University, in collaboration with other stakeholders, should lead this **Renewal**.

**iii)** Tribal belts and other niche areas suitable for organic farming should be declared as Organic Farming Zones and appropriate production, post harvest management, certification and marketing facilities should be provided in an integrated manner. Organic production of medicinal and aromatic plants holds a great promise in the State.

**iv)** Since most of the upland in Jharkhand is marginally utilized, there is ample scope for diversification towards horticultural production. Enterprises like dairy, poultry and fisheries should also be promoted in an integrated manner. Agricultural diversification should be based on market demands. While training should be intensified in the diversification programme, training of women farmers should be given special attention.

**v)** Irrigation remains generally neglected in Jharkhand. The Government of India should give special support for increasing irrigation intensity in the State.

**9.** After the Consultation session, Members of the NCF assured the full consideration of the suggestions and written representations made by the State Government and participants. They also thanked the State Government for the courtesy shown.
STATE LEVEL CONSULTATION OF KARNATAKA FOR FEEDBACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT BANGALORE ON 24th JUNE, 2006.

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Bangalore on 24th June, 2006. Prof. M.S. Swaminathan, Chairman, NCF was accompanied by Shri Atul Sinha, Member Secretary, NCF, Dr. R.B. Singh, Member, NCF, Shri Y. C. Nanda, Member, NCF and Ms. Mamta Shankar, Director. Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

2. Inaugural Session

2.1 Welcome address by Shri Bandeppa Kashempura, Hon’ble Minister for Agriculture, Government of Karnataka

During his welcome address, Shri Bandeppa Kashempura, Hon’ble Minister for Agriculture spoke about the following pro-farmer programmes initiated in Karnataka State by the present Government:

i) *Panchasutra* programme for accelerated growth in agriculture sector.

ii) Distribution of soil health cards covering 9000 villages at a cost of Rs.5 crores in a span of three years.

iii) Credit facilities through co-operatives to the extent of Rs.3 lakhs per farmer at 4% interest.

iv) Schemes for agricultural processing and post harvest technology with financial allocation of Rs. 20 crores and Rs. 10 crores respectively.
v) Further, he requested farmers, experts and representatives of NGOs and other organizations to suggest to the National Commission appropriately to improve economic status of the farming community.

2.2 **Address by Shri Doreswamy, Freedom fighter**

Veteran, revered freedom fighter Shri Doreswamy expressed on Gandhian thought about import of food grains as “Colossal insult to the Nation”. He opined that agriculture be treated as an industry. He also suggested that while making policies, attention be given to the small and marginal farmers. Further, he said that agriculture is a fine art occupation and creates opportunities for work.

2.3 **Opening Remarks by Prof. M.S. Swaminathan, Chairman, NCF**

i) Dr. M.S. Swaminathan released *Panchasutra* poster designed and brought out by the Department of Agriculture, Government of Karnataka.

ii) Chairman, NCF informed that the main purpose of the interaction session was to elicit advice from farmers, subject study groups, other allied institutions, NGOs, input supply agencies etc which reflect the need of farming community, for making necessary amendments in the Draft Policy. His discussion was mainly centered around the following subjects:

iii) Slow growth rate of agriculture as against the target of 4% was alarming.

iv) Market surplus has no meaning for small and marginal farmers.

v) He appreciated the credit policy of the State at 4% interest through co-operatives.

vi) He narrated Shri M.K.Gandhi’s visit to NDRI, Bangalore and recording in the visitors book as Porabandar farmer against profession column in the register which signified Gandhiji’s concern towards the farming community.

vii) He appreciated the *Panchasutra* programme suggested in the Draft Policy of NCF that had been adopted in Karnataka State.

viii) Need for creating broad based policy which would also take care of interest of landless labourers, other stakeholders, trend setters and farm related distribution.
3. **General Observations and Suggestions**
i) Investment in agriculture sector should be increased.
ii) Budgetary allocation to agriculture and horticulture sectors should be enhanced.
iii) There is a need for recognition of farmers’ efforts in their innovations, methods and experiments.
iv) Farmers’ Organizations should be involved in drafting farm policy.
v) Interaction sessions of NCF should be held at Gram Panchayat level also.
vi) Small scale and cottage industries that generate income for rural people should be encouraged.
vii) Bottom up approach - Gram Panchayat plans should find place in annual action plans of line departments.
viii) Farmers need not only be ensured remunerative prices but also they should get respect/dignity.
ix) Men farmers should also be encouraged to form SHGs on the lines of women SHGs.
x) Uninterrupted power supply to be ensured for villages.

4. **Land**
i) Selling of agricultural land for non–agricultural purposes should be avoided.
ii) Transfer of land for non agricultural purposes should be banned.
iii) Need for land reforms was stressed.
iv) Extension of cities should be restricted and infrastructure facilities should be developed in villages to make rural life attractive to youth.

5. **Livestock**
i) SHGs should be given training in production of animal feed concentrates for which raw materials may be supplied to them.
ii) Every Gram Panchayat should have a Veterinary hospital.
iii) Cultivation of fodder should be encouraged and surplus fodder stored in silos constructed for the purpose.
iv) Programmes to supply ½ liter milk to pregnant and lactating women to meet their special nutritional needs should be launched.

v) Under milk sector private firms are allowed in Milk & Milk Produce Order (MMPO) – this should be avoided.

vi) Local breed of livestock should be improved as they ensure self-sufficiency.

vii) Breed improvement centres are needed all over the country.

viii) Medicinal properties of *Panchagavya* should be popularized.

ix) Subsidiary occupations like rearing cows, sheep and goats should be encouraged in order to help farmers to come out of financial crisis.

x) Farmers should be given permits for sustainable grazing of sheep/goats in reserved forest areas.

xi) Rearing of small ruminants must be encouraged.

xii) Extension education and vaccination facilities should be extended to sheep rearing also.

xiii) 5 to 10% of land may be set aside for rearing/grazing livestock.

xiv) Hybrid fodder variety development should be encouraged.

6. **Research, Technology, Inputs and Extension**

i) Special agricultural schools should be established in rural areas to educate agricultural labourers on agriculture and essential modern technologies.

ii) Vacant posts in Department of Agriculture and Horticulture should be filled up.

iii) Horticulture universities should be established.

iv) Priority should be given to organic farming and training given to farmers. Some however expressed that Indian agriculture should not be taken 100 years back through adoption of organic farming.

v) Forest based agricultural system through growing tree crops should be promoted.

vi) Medicinal plants should be encouraged.

vii) A farmer informed about existence of 2500 species of plants in his farm and produces which are converted to 500 value added products – such farming should be encouraged.
viii) Production and supply of organic inputs at a subsidized rate is required.

ix) Contributions of green revolution should be appreciated. Mistakes should be rectified. Modern technology should not be neglected. A proper balance is needed.

x) Programmes related to conversion of plant and animal residues to manures should be adopted.

xi) Villages should have internet facilities for accessing meteorological information and technical information on agriculture.

xii) Diploma course in agriculture may be introduced in universities at the undergraduate level and syllabus on agriculture needs to be included in school curriculum.

xiii) Small farmers should be given subsidies for purchase of bullocks and carts (at present big farmers are getting benefit for purchase of tractors).

xiv) Quality control of inputs and their regulations should be strictly enforced.

xv) Quality seeds should be supplied - Sellers of spurious, sub-standard seeds must be punished.

xvi) Supply of spurious/non-standard fertilizers, seeds and equipments has continued-legal action should be strictly enforced.

xvii) Quality seeds should be supplied through SHGs.

xviii) SHG members should be educated on Seed treatment methods.

xix) SHG members need training on preparation of Bio fertilizers.

xx) Farmers and SHGs should be involved in Seed production.

xxi) SHG members should be trained on ascertaining quality of agricultural inputs.

xxii) Any new information/technology should be routed through SHGs; Technical support should be provided to SHGs for dissemination of knowledge in agricultural development.

xxiii) As SHGs empower farmers, Policy should be oriented towards such efforts.

xxiv) Karnataka State Seed Corporation should enhance its production capacity.

xxv) State Agricultural Universities should be encouraged to take up seed production.

xxvi) Co-operatives with limited number of members will be more successful.
xxvii) Seed Bill 2004 is against farmers’ interest; hence, do not hand over seed industry to MNCs. There should be suitable orientation for effective utilization of technology and research findings by them.

xxviii) Agricultural University scientists should not transfer seed production technology / seed lines to MNCs and exploit farmers.

xxix) Government should supply inputs like improved implements, machinery, bio-fertilizers etc. at 90% subsidy to poor farmers.

xxx) Fill up vacancies of technical staff in the related departments.

xxxi) More agricultural assistants should be employed at the grass root level and the necessary facilities should be provided to them.

xxxii) Effective utilization of modern technologies and audio-visual aids for reaching farmers are necessary for agricultural development.

xxxiii) Small and marginal farmers should be taken care of in horticulture development programmes.

xxxiv) There is a need to improve transfer of research innovations developed in the laboratories to the farm level.

xxxv) There is a need for the adequate supply of agricultural implements, machinery at subsidized prices.

xxxvi) Implements and machinery should be available on hire basis.

xxxvii) Information on agriculture should be given as prime news in newspapers and other mass media.

xxxviii) State departmental activities should not be reduced to mere distribution of subsidies.

7. Credit and Insurance

i) Creditworthiness of farmers should be improved through bio-metric profiling.

ii) Provisions to avail loans by small and marginal farmers both for development and for crop production programmes to be made.

iii) Provide subsidies on the lines of NABARD (credit subsidy to loan accounts after proper utilization of loan amount).

iv) Channelize credit from urban / Sauharda Banks to agricultural sector.
v) Banks and Insurance Companies must be farmer friendly.

vi) Credit policy needs to be changed – RRBs should not die down, credit supply formalities should be reduced. National and State Credit Policies should be same. Co-operative structure should be strengthened and easy credit should be provided to SHGs.

vii) Commercial banks should also provide loans at 4% interest and small/marginal farmers should be given priority

viii) National banks provide credit at 7% interest but in reality it is 9%.

8. Marketing Distribution and Trade

i) Farmers should be given proper advice on remunerative crops.

ii) Role of corporate farming should be enhanced.

iii) Mandates of such corporate farming should include
   a) Participatory research programme.
   b) Cold storage structures.
   c) Alignment with NGOs

iv) Minimum and maximum prices for agricultural inputs and produce should be fixed.

v) Petrol, diesel prices are enhanced every few days – but it is not so with the prices of agricultural produce.

vi) Fruits and vegetable markets should be strengthened in the line of silk cocoon markets.

vii) Local markets should be established to ensure guarantee price.

viii) Co-operative market outlets for the products produced by Sthreeshakthi groups should be launched.

ix) Benefits of APMCs have not reached small, marginal and medium farmers.

x) Cold storage facilities at taluk level and small food storage centers at Gram Panchayat level were needed.

xi) Weekly shandies in villages should be encouraged.

xii) Farmers have to practically pay 8 to 10% commission while marketing agriculture produce. This should be done away with.
xiii) MNCs should not be allowed in agriculture produce marketing.
xiv) Remunerative prices to agricultural produce should be ensured.
 xv) SHGs may be involved in marketing of agricultural produce on the lines of **Rythu Bazaars**.
 xvi) Mini Dairy co-operatives run by women groups have been very successful in a few villages- needs to be extended to other villages.
 xvii) Assistance was needed for marketing vermi compost produced by SHGs.
 xviii) Farmers’ share in consumer’s rupee should be increased.
 xix) Proper market for agricultural produce should be ensured.
 xx) Processing of agricultural commodities should be encouraged.
 xxi) There is a need for strengthening of APMC Act (not to privatize it).
 xxii) Ensure fair prices instead of providing subsidies.
 xxiii) Export promotion policy is not clear in NCF draft report.
 xxiv) Export subsidy should be provided and agricultural exports should be strengthened.
 xxv) Quantitative Restrictions (QRs) to protect interest of farmers should be brought back.
 xxvi) Marketing organizations should be improved on the lines of HOPCOMS.
 xxvii) State Governments to recognize producer companies as done by the Government of India.
 xxviii) There is a need to establish independently managed separate fund to meet the distressed farmers’ needs.

9. **Dryland Agriculture**

i) Restrictions to be imposed for installing 1 to 2 pump sets per family.

ii) Low External Input Sustainable Agriculture (LEISA) is the need of the hour.

iii) Bring back life to the soils in drylands; change in attitudes/perceptions of farmers regarding rational use of natural resources is needed.

iv) Minimum distance between two bore wells to be enforced.

v) Need for special packages to the drought prone areas (North Karnataka districts).
vi) To establish systematic progress, there is need for adoption of climate dependent agricultural methods.

vii) Efficient use of irrigation water is needed.

viii) Lands cultivated by landless labourers should be decided for allotment immediately.

ix) NCF to fix land to forest ratio so as to avoid further deforestation.

x) Agro-forestry and ‘Green for Fuel’ should be encouraged.

xi) Irrigation cost per acre needs to be worked out.

10. PRESENTATION BY SUBJECT COMMITTEE EXPERTS

10.1 Subcommittee on Soil Health & Productivity Enhancement

Dr. S.A. Patil, Chairman of the Sub-committee highlighted the following strategies:

i) Listing of soil quality indicators.

ii) Strategies and action plan for
   a) Mechanism to create soil health awareness
   b) Soil & water conservation techniques
   c) Developing packages for reasons specific sustainable farming
   d) Setting up of precision farming centres.
   e) Promotion of organic farming

10.2 Subcommittee on Irrigation Water Supply Augmentation and Demand Management

Capt. S. Raja Rao, Chairman presented on the following terms of reference and detailed report was submitted to the Commission:

i) Mainstreaming Rain Water harvesting

ii) Policy incentives and awareness creation

iii) Crop planning

iv) Improving water use efficiency

v) Water use regulatory mechanism
vi) Strengthen Water Users’ Association
vii) Low cost technology for water conservation & management

He gave remedial measures under short term and long term duration as follows:

10.2.1 Short Term remedial measures

i) Extend Under Ground Drainage system to all class-I cities.

ii) Provide tertiary treatment for domestic and industrial water and recycle the treated water and thus reduce the requirement of fresh water.

iii) During drought years, practice “cloud seeding” and harness additional 15% to 20% of water.

iv) Adopt canal automation synchronizing with computer controlled management to use ground water and surface water.

v) Resort to desalination of water in coastal areas and other problematic areas.

vi) Adopt ‘pumped storage concepts’ wherever possible for all hydel projects and thus save water and produce more electricity.

vii) From ecological consideration, maintain a minimum flow in the river.

viii) Encourage less water intensive crops as far as possible.

ix) All polluting and water based industries (17 Categories) should have to mandatorily seek ISO 14001 Certification by law.

x) Encourage private participation in the construction, operation and maintenance of Water and Sewage Treatment Plants.

xi) National / International Benchmark for water consumption and water reuse in each of the 17 category of industries should be fixed and a rigid time frame be set to achieve it.

xii) Create public awareness for economizing water use with more and more participation of women.

xiii) Waste utilization technologies / use of clean production technologies with emphasis on waste minimization, recycling and reuse have to be encouraged for adoption.
xiv) All local authorities having piped water supply scheme should conduct leak detection studies and take remedial action to save precious water.

10.2.2 Long Term Measures

i) Piped water supply for irrigation
ii) Desilting of Reservoirs
iii) Inter-Basin Transfer
iv) Canal Automation
v) Extend Under Ground Drainage and Sewage Treatment Plants to all habitations.

10.3. Subcommittee on Agricultural Technology and Extension Management

Dr. Dwarkanath, Chairman of the Sub-committee pointed out that the average farm size is becoming smaller each year and the cost-risk–return structure of farming is becoming adverse. He put forth a strategy for achieving 4% growth rate in agriculture and discussed exhaustively regarding Asset reform, Land reform, Power and Economy of scale, Livestock, Fisheries, Water, Water use efficiency, Agro Biodiversity, Animal genetic resource, Climate change and Science & Technology. As a separate chapter, he presented views on pro-small farmers and pro-women programmes regarding knowledge connectivity, rural employment guarantee, digital revolution, organic farmers, crop diversification, agro-meteorology, bio-security, credit & insurance, co-operatives, assured & remunerative marketing opportunities. Finally, he suggested public policies for sustainable livelihood and further course of action.

10.4. Sub-committee on Credit & Insurance

Shri. D.B. Ghosh, Chairman of the Sub-committee explained briefly about credit facilities provided through NABARD. He also suggested the issue of Kissan credit cards to farm men and farm women. Besides he suggested popularization of Farmers’ Contact Center and e-Grama.
10.5 **Subcommittee on Agriculture Market Reforms and establishing Indian Trade Organization**

Dr. R.K. Deshpande, Chairman of the Sub-committee gave presentation on the following issues:

i) Enabling provisions and the required amendments in the APMC Act.
ii) Contract farming and direct marketing with an established code of conduct.
iii) Establishment of Indian Trade Centre, supported by a Trade Advisory Body for Small Farmers
iv) Supporting /strengthening Producers’ co-operatives and market linkages.
v) Synergy between forward and backward linkages, agro-processing & export market development, production planning, use of information technology in agricultural marketing.
vi) Establishing Hope Generation Teams.
vii) Price Stabilization Fund, Market Intervention Scheme, group farming for self help groups, corporate farming, company farming.
viii) Creation of SHG capacity building and mentoring centres.

11. After the Consultation session, Chairman and Members of the NCF assured the full consideration of the suggestions and written representations made by the State Government and participants. They also thanked the State Government for the courtesy shown.
1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Thiruvananthapuram on 25th July, 2006. The NCF was represented by Shri Atul Sinha, Member Secretary, Dr. R.B. Singh, Member and Ms. Mamta Shankar, Director. Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

2. General Observations and Suggestions

i) Farmers should be issued Identity Cards. Farmers’ rights should be defined and farmers’ courts should be set up. A constitutional body to listen to farmer’s woes is required.

ii) The cost of labour was high as compared to other States. Instead of depending on raw produce, emphasis has to be given on value addition.

iii) The Plantation Labour Act should be amended.

iv) For assessing crop loss, per ha. or per crop criterion was adopted. This was not practicable in Kerala where homestead farming is practiced. The National Horticulture Board, Ministry of Agriculture, NABARD and Commodity Boards may be asked to restructure their schemes of assistance for crop support and assessment of crop loss to farmers of Kerala on homestead basis.

v) Given the agro ecological diversity in the State and the localized nature of agrarian distress the farmers requested that the Commission should hold discussions in hard hit districts like Wayanad, Idukki, Kasargod, Kuttanad and Calicut.
vi) The services of Panchayati Raj organizations, like Gram Sabha and Ward Sabha (in respect of Municipalities and Corporations) should be utilized for identifying social evils.

vii) Definition of farmers should include mushroom cultivators and people practicing apiculture and mariculture and other farming related occupations.

viii) There should be a provision for the forest – dwelling communities to object to or seek changes in ‘development’ projects that are impinging on their lands and resources. The decisions should be based on specific studies.

ix) Ecotourism should be encouraged.

x) Some mechanism was required for control of wild animals.

xi) While framing national plans, Kerala must be given a special package like the North Eastern State due to diversity of plantation and agriculture crops.

xii) Agriculture must be included in the school curriculum.

xiii) The Agriculture Communication System should be redesigned with farmer at the core to provide public space where farmers could discuss their problems.

xiv) Cottage Industries related to agriculture, livestock, marine products appropriate for Kerala should be developed.

xv) Environmental problem due to sand mining, filling up of paddy fields, mining of granite mounts, sea erosion and indiscriminate use of chemical fertilizers and pesticides were a great cause for concern in the state.

3. Land

i) National Land Reform Policy and a National Land Use Policy would have to be evolved immediately.

ii) Due to land shortage, intensive and mixed agriculture with crop rotation within the small holdings or home gardens would be beneficial.

iii) The ‘Pattam’ system was creating problems which may have led to suicides and other adverse social evils. Under ‘Pattam’ system, cultivators take land for cultivating paddy for a season without any written agreement. The farmers are
unable to raise the loan. To facilitate credit, ‘Pattam’ may be legalized by providing fair rent @ 1/6th of the produce.

iv) Kerala should look at the possibility of introducing hazelnut and other high value fruits. To achieve this, the Land Ceiling Act had to be relaxed.

v) Before introducing Soil Health Pass Book farmers should be given training.

vi) Soil Health Card should include bacterial count.

vii) Land should be surveyed with the help of GIS application and computerization of records should be done for simple and transparent land transfer. The Karnataka model could be emulated.

viii) ‘Cooperative Production Samiti’ should be strengthened.

ix) A review and reorganization of “Swarsraya Sangham” is required.

4. **Livestock & Fishery**

i) A Resource map of livestock resources should be drawn up and the carrying capacity of these resources should be calculated.

ii) Appropriate breeding policy, appropriate culling rate and integrated development projects (taking care of all elements up to marketing and institutional support etc.) should be emphasized.

iii) Disease control programmes were confined to few districts in the State. There should be comprehensive state wide disease control initiative.

iv) Reasonable slaughter of cows for export could be carried out.

v) By products like glands and bones should be utilised.

vi) All Universities should do need based/demand based research.

vii) Health care linked animal insurance scheme should be made available.

viii) Fish may be included along with cattle, sheep, poultry in developing living heritage gene banks of the germplasm.

ix) The development of Ecotourism should not be at the expense of traditional fish farmers. The application of Geographical Information System in fishing and the concept of virtual university in fish marketing should be exploited.
In the present scenario, fishery is extractive in nature. Schemes were needed for promoting fish rearing and protective fishery.

5. **Issues specific to major crops**

5.1 **Coconut**

i) Coconut was sown in homesteads and covers a huge dispersed area unlike rubber which was done in compact area.

ii) Considering the number of people dependent on it for their livelihoods the investment was very low.

iii) Problem of root wilt disease prevalent in 5 major districts in southern Kerala with no cure.

iv) Replanting programme was very important. There was a provision of replanting under the National Horticulture Mission for horticultural crops. Even for rubber there was provision for replanting. There should be provision for replanting of Coconut under Technology Mission or Coconut Board.

v) Most of the coconut was unirrigated.

vi) Coconut Board has no mandate for research and no field units.

vii) Coconut Board should be under Commerce Ministry.

viii) Assistance required for replanting, irrigation and processing of coconut.

ix) Ministry of Agriculture was going to give assistance for micro irrigation with 50% subsidy.

x) Assistance required for replanting had to be of a high magnitude since the coconut tree had a 7 year gestation period.

xi) Innovative diversified products like ‘Nira’ have been launched.

xii) Amendment in excise rules of States was required, since at present a farmer could tap only 5 trees. For processing Nira more inputs were needed and a catchment area of 250 plants was required for setting up a processing plant.

xiii) FTA with ASEAN would pose a threat as they were cost effective competitors and so far the domestic sector was protected with a high tariff wall with 100% tariff on imported coconut. Coconut should be in ‘Sensitive list’.
xiv) It is in sensitive list under SAFTA but coconut is also coming from illegal means and hurting our farmers.

xv) With the help of Coconut Technology Mission processing units and tender coconut project had been initiated and cluster approach was being adapted for assistance under the Mission.

xvi) 45% duty was imposed on imported soyabean oil. Given its importance to the Kerala Economy coconut should be declared as ‘protected oil’. For this, even 45% duty rate was not enough.

xvii) Coir, rubber were not considered as agricultural commodity in WTO.

xviii) Coconut oil was a canalized item for import through STC. Under Advance Licensing Scheme (ALS) it had to be re-exported but no time limit was specified and there was a sudden spurt in import of coconut oil.

xix) Due to multifarious problem faced, Coconut plantations were being converted to rubber plantations. Coconut cultivation should be subsidized.

5.2 Pepper

i) Farmers in the State should be consulted before agreeing to FTAs and import tariff.

ii) Ministry of Commerce were signing all FTAs without consulting Agriculture Department of States.

iii) Industry was paying premium to Sri Lanka pepper.

iv) Quality of Vietnamese pepper was poor.

v) For pepper we have to change our support for better revenue.

vi) Illegal smuggling of areca nut, cardamom, pepper should be controlled.

vii) Central Government aid should be given to the State Governments to promote our agricultural commodities by branding each produce like ‘Kerala black Pepper’. This would help the farming community to fetch higher price in domestic and international markets.

viii) Under SAFTA Agreement, countries had violated rules of origin and imported pepper from Vietnam and re-exported it to Kerala. The mixing of this low
quality pepper with world famous Kerala pepper was bringing bad name to Indian pepper.

5.3 Rubber

i) Rubber should be re-defined as agricultural product due to influx of cheap import.

ii) Certification of wood products by Forest Stewardship Council for export was necessary. Rubberwood must be included for that purpose.

iii) Rubber producers society may be exempted from Value Added Tax as they were self help groups.

iv) Subsidies for planting as well as replanting should be same.

5.4 Cardamom and Ginger

i) Traditional export like ginger cardamom were facing stiff competition. These crops may perish if the interests of the farmers are not safeguarded with the help of research and price support.

ii) Cardamom was cultivated in forest areas of Idukki by small growers. Small growers affected by the Indian Forest Act should be protected with a package.

5.5 Vanilla

i) Crash in prices of vanillin had ruined the vanilla farmers. The import of synthetic vanillin should be banned.

5.6 Paddy

i) In Kuttanad area, due to the fall of price of paddy, crop failure for the last three seasons also created a crisis like situation. Specific importance should be given to this region.

ii) The Government should fix floor price of agricultural products like, paddy coconut etc. and procure the product from the farmers without middlemen. The produce may be sold through Public Distribution System (PDS). The Kerala
model of procuring paddy by the State Supplies Corporation @ Rs.700/- per quintal during the previous panja season could be adopted.

5.7 Pineapple

Pineapple was grown as intercrop in rubber replantation areas. Pineapple was also grown as intercrop in coconut. It was highly labour intensive and high wages were paid to pineapple farm labourers. Proper recognition was not given to pineapple farming still its area and production was increasing. If pineapple intercropping is expanded in coconut root wilt areas it will partially compensate the loss of coconut farmers.

Suggestion for development of pineapple cultivation include: -

i) Trucks and rail wagon with cooling facilities should be provided.
ii) Indirect benefit like interest free loan, low cost input should be provided.
iii) Legal sanctity for contract farming should be ensured.
iv) Facility for product diversification and promotion of alternative fruit should be provided.
v) Low cost machine for land preparation should be designed.
vi) Coir Geo textile were useful in soil conservation and weed control, make it cost effective and modify its design.
vii) Liberal facility for pest and disease management, quality control of input be given.
viii) Pineapple Centre should be established with facilities for market information, e-commerce, training and processing and recreation.
ix) Pineapple Board should be established.
x) Lab was required to test agricultural inputs on payment basis.
xi) Inadequate credit and insurance facility was a constraint. Security asked by the Cooperative banks was very high.

6. Organic Farming

i) Organic farming should be encouraged.
ii) Organic farming needed to be systemized and inputs may be provided in cash or kind to promote it. It should be subsidized for first three years.
iii) Government should subsidize certification and set up organic marketing chains.
iv) State Agricultural Universities may be declared as the competent authority for certifying the organic products.

7. Credit and Insurance

Most Farmers made demand for concessional, timely and adequate credit. For agrarian distress cases, writing off of debt, further help in the form of loan and agriculture inputs to marginal farmers should be considered. Specifically it was suggested that:

i) NABARD should give loan to farmers at 3% interest directly.
ii) Interest free loan up to Rs. 1.00 lakh for small and marginal farmers and at 4% for other holdings up to 2 ha land should be given.
iii) Insurance scheme should be launched for farmers with pension and medical benefits.
iv) Government should make necessary arrangements for providing interest subvention to cooperative bank for involvement of their own high cost funds in agricultural lending or NABARD may provide 85% of the total credit provided by Cooperative Banks by way of refinance. In case of Cooperative Banks, NABARD has offered refinance of only 35% of total crop loan and has not proposed any interest relief in respect of the own funds to be used by cooperative banks for agricultural lending.
v) Convenor, SLBC, informed that the indebtedness to money lenders has increased manifold in the last decade in the state. He mentioned the various initiatives taken by the lead Bank like expansion in coverage no collaterals for loans below Rs. 50,000 etc. He also spoke about the pilot project on 100% financial inclusion in Palakkad District and the proposed survey of farmers’ indebtedness in the State. Following suggestions were made:

a) The state government should allow to deposit registration deed in the Bank before taking loan as was the case in Bihar.
b) At present, only annual agricultural crops were being covered by insurance. Perennial plantation crops should also be made eligible for insurance.
c) Leasing of land was not valid in Kerala, it should be allowed to enable financing to oral lessees

vi) The representative from NABARD suggested that consultation for agriculture credit policies should be held at corporate level. He also talked of Kerala specific issues like decline in competitiveness of traditional crops, importance of water harvesting and need for sustainable organic farming.

8. **Issues related to the Production, Marketing, Distribution and Trade with respect to some important crops in Kerala:**

The State is producing paddy, coconut, vegetable and fruit, medicinal plants, spices, plantation crops like tea, coffee, pepper, cardamom etc. These are concentrated in different areas of the State. There were special problems facing all these products. Farmers from these districts made the following suggestions:

i) Areas of AEZs should be expanded.

ii) Producers’ companies working on cooperative basis for procurement, grading and value addition of agricultural produce with Government participation to ensure reasonable price for the produce should be constituted. Cooperative farm shops on the lines of ‘Ryathu Bazaar’ in AP should be started.

iii) Fair Prices instead of subsidies and pesticides to be given.

iv) Boards should be formed for all commodities.

v) The number of small growers (less than 2 ha) should be represented in various boards.

vi) Transportation of agriculture produce was hindered by forest laws. Laws which restrict movement of goods should be rescinded.

vii) MSP for spices should be improved.

viii) There should be a Price Stabilization Fund for farmers.
ix) Price Insurance Scheme was needed.
x) Competitiveness in terms of costs was required. Productivity should be raised.
xi) Top priority should be given by the Central Government for selection of quality seeds which will help the farmers to attain maximum productivity from their holdings.

xii) There was a mismatch between input and output prices, Govt. should subsidize seed price.

xiii) Industry and Trade Bodies should be more active.

xiv) Role of PDS should be expanded.

xv) While cost of all commodities had gone up astronomically, price of farmer produce had gone up only arithmetically.

xvi) Comprehensive replantation programme for perennial crops and senile orchards should be adopted for coconut, arecanut, cashew, rubber, and tea with the help of high quality planting material. NREGP should include replantation activity in Kerala.

xvii) Steps to expand medicinal plant cultivation and scientific Ayurveda treatment should be taken up.

9. Issues related to Import Policy

i) Implication of the new IPR regime and pending Seeds Bill should be elaborated.

ii) Given the agro-climatic and ecological diversity, States should be final arbiters on policy issues be they IPRs, trade negotiations or aggregate measures and support.

iii) WTO negotiations should be made subject to satisfactory resolution of livelihood security arising from opening of the trade.

iv) Competition from other countries and the threat of imports at low duties were cause of concern to cash crops.

v) Before formulating the Import Policy the views of the Farmers should be consulted. All import policies should be examined from the viewpoint of their impact on farmers.

vi) FTAs should be entered only after consultation with States.
vii) Quality test on the import commodity should be strictly monitored.

viii) Seeing the plight of the Kerala farmer the import duty on spices should be raised.

ix) M.S. Swaminathan Committee recommendations should be implemented.

10. **Rural Energy**

i) Biogas should be taken up as a National programme.

ii) Flowers of cashew nut and nutmeg shell could be used for ethanol.

iii) Energy problems in rural areas should be given importance – a comprehensive rural energy plan was needed.

11. **Suggestions and Observations made by the Honourable Minister for Agriculture, Cooperation, Finance and Fisheries:**

After the Consultation session, Members of the NCF held discussions with Ministers in-charge of Agriculture, Animal Husbandry, Fisheries and Cooperation of the State Government. The Minister apprised the Members about the steps taken by the State Government in favour of farmers and raised various issues needing attention of the NCF relating to their State.

i) Hon’ble Minister of Agriculture, Shri M. Ratnakaran, highlighted the acute crisis faced by the major crops in Kerala due to volatility in prices. The removal of quantitative restriction has led to an annual loss of Rs.7000 crores due to price crash. While signing the bilateral and multilateral agreement on trade, the State was not consulted although agriculture is a State subject. Unless the credit policy was restructured to provide interest free loan till prices improved for farmers, coconut and paddy would not survive. A viable crop insurance scheme was needed. He expressed his reservation over corporate and contract farming and alienation of land and diversion of prime agriculture land for other purposes. The cooperative Amul model should be adopted. He made a request to hold one consultation at Calicut.

ii) The Hon’ble Minister for Cooperation, Shri G. Sudhakaran, Government of Kerala highlighted acute distress faced in Kuttunad region of the State where
the paddy and coconut farmers were facing a debt trap. He requested for a Vidarbha like package for the region and a reduction in rates charged by NABARD from cooperative banks.

iii) The Hon’ble Finance Minister, Dr. Thomas Issac also highlighted the unprecedented agrarian crisis and the drastic squeeze on agricultural income due to impact of WTO policies. He requested that the stand taken by the Swaminathan Committee should be reflected in the Policy. He also requested that there should be a separate paragraph on lack of public investment in agriculture. He also mentioned about the difficulties faced by the State Finance Department in spending for farmers due to restriction under the FRBM Act. He suggested that the Centrally Sponsored Schemes should be amenable for decentralized local level planning. He also mentioned that all local plans of Kerala would be watershed based henceforth.

iv) Hon’ble Fisheries Minister, Shri S. Sharma, recommended adoption of sustainable fishery with community management, aquarian reforms and a National level social security programme for fish farmers. He also suggested that there should be legislation for coastal water property ownership as the tourism resorts were taking away the beaches. The traditional catch should be included in the sensitive list in WTO.

12. The Members assured the full consideration of the suggestion and written representations made by the State Government and participants. They also thanked the State Government for the courtesy shown.
STATE LEVEL CONSULTATION OF MADHYA PRADESH
FOR FEEDBACK ON THE DRAFT NATIONAL POLICY
FOR FARMERS AT BHOPAL ON 21st JULY, 2006.

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Bhopal on 21st July, 2006. Prof. M.S. Swaminathan, Chairman, NCF was accompanied by Shri Atul Sinha, Member Secretary, NCF, Dr. R.B. Singh, Member and Ms. Mamta Shankar, Director, NCF. Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

2. General Observations and Suggestions

i) Farmer should be those who depended wholly on Agriculture.

ii) There was a need to develop segregated planning for every group covered under the definition of the farmers otherwise some practical difficulties may arise during the implementation of various schemes.

iii) Detailed study was needed for identifying the reasons behind the suicide of the farmers and best possible efforts were needed for rehabilitation of the family. Serious punishment should be given to the accused.

iv) There was need to conduct a comparative study of standard of living in urban and rural areas.

v) Policy must speak about the illiteracy and poor health conditions of the children of bonded labourers.

vi) National Farmers’ Welfare Fund and State Farmers’ Welfare Fund must be established.
vii) There was need to strengthen extension mechanism in an efficient manner through ICT for Agriculture.

viii) Information on various inputs, labour availability and success stories should be highlighted.

ix) Area specific information rather than broad information was needed.

x) Local language or dialect should be used.

xi) Information should be delivered quickly at farmers’ doorstep.

xii) Viability of ICT mechanism and proper management were vital for ICT to be successful.

xiii) Training one man and one woman at panchayat level for solving local problems related to agriculture was not practically possible as availability of such person in every village was doubtful. This kind of training programme should be of high quality and preferably given to agriculture graduates.

xiv) Visits to progressive area of the country for one progressive farmer from every Gram Panchayat should be facilitated.

xv) Reimbursement of fare to farmers for attending the Panchayat Meeting would act as an incentive.

xvi) Meeting with farmers should be held at Mandi levels.

xvii) Crop competition, honouring farmers and nominating top farmers at all levels in Zilla Parishad, Zilla Panchayat, Vidhan Sabha etc. should be encouraged.

xviii) Officers at senior level should be responsive. For agriculture the District Collector should have enough time to devote for Agriculture.

xix) Secretary of Agriculture, Horticulture, Animal Husbandry at centre and state level should be a technocrat for proper implementation of agricultural and allied activities as envisaged in the Draft Policy for Farmers.

xx) A Twenty-four hour channel on agriculture on Doordarshan should be introduced for farmers.

xxi) Section 35 (2 AB) of the Income Tax Act provides for 150 % deduction on pharmaceuticals, electronic equipments etc involved in research. This should be extended to agro based companies too as they were engaged in agri-research and development, farmers training and education etc. Agro based companies should
also get exemption from Fringe Benefit Tax for free distribution of samples of various agro inputs, expenses on sales promotion and market research.

xxii) Private sector should be attracted by providing tax benefits and subsidy for a period of five years for strengthening the extension services of agriculture.

xxiii) The concept of village trade balance was put forward. While seed, fertilizer, pesticide, diesel, equipment make the village trade balance negative, crop production and animal product make it positive. Policies should strive to include all suggestions which made this village balance positive.

xxiv) Every place had its USP. We should market and exploit our quality parameters.

xxv) Recommendations should be backed by financial implications.

xxvi) Small Scale Units based on local crops should be set up.

xxvii) Help to farmers in States where there were no suicides cases should be given to prevent suicides.

xxviii) Issues related to tribal women in agriculture and women labourers were not addressed adequately.

xxix) All Agricultural Universities should reserve one month period for village visit once a year.

3. Land

i) Prices fixed for Land acquisition were very low considering market rates. Even this was not paid to farmers.

ii) Farmers were spending too much on litigation over land acquisition for dams and urban and industrial expansion.

iii) Government had promised that 20% of developed land would be returned to farmers but this was not put to practice.

iv) Farmers protesting over these issues were beaten up. A ban on lathi charge on farmers should be recommended.

v) Policy was needed to stop acquisition of agricultural land and for establishing industries. Only uncultivable waste land should be transferred to corporate sectors or business houses.
vi) Long term lease (30 years) for ravines of Chambal and other degraded waste lands may be given for the purpose of rehabilitation of these lands through different agricultural systems.

vii) There was need to formulate a strong developmental programme with hundred per cent assistance from Government of India to check the erosion.

viii) NCF should gather data for the last 20 years on acquisition of agricultural and waste land for industrialization, urbanization and construction of roads, the pending cases for distribution of compensation and total amount distributed as compensation against acquisition of land.

ix) In the interest of Scheduled Tribe (ST) farmers, measures should be included in the policy for land acquisition, sale of land, land transfer etc.

x) There should be a law which protects tribal community from problems arising in taking their animals for grazing in plain and forest areas.

xi) Schedule Tribes (ST) involved in production and conservation of forest product should get similar right on forest products as given to land owner. Similar law must be there for fishers who are totally dependent on the fishing.

xii) Farmers should be freed from various articles of land revenue and other judicial activities which hindered the progress of agriculture leading to loss of wealth.

xiii) Size of holding below which fragmentation was uneconomical should be fixed by a law.

xiv) Consolidation of holding was required.

xv) Private sector was providing soil testing as the Government machinery was not providing them.

4. Water

i) Farmers irrigating their crop using electricity should get more subsidy as compared to farmers having access to canal irrigation.

ii) Dry land horticulture including medicinal plants should be encouraged in water scarce areas.

iii) Water Resource Conservation Bill should come in place to protect the various water resources.
iv) Efficient management of irrigation (from head to tail end) and uninterrupted supply should be ensured for the development of agriculture.

v) Government may dig deep tube wells and sell the water to farmers.

vi) Problems of tail enders should be addressed. The productivity of crops was lower in tail areas. Give free water and electricity but charge taxes.

vii) Duty on sprinkler drip irrigation should be reduced.

viii) To avoid problem of displacement, tank irrigation should be adopted.

ix) Equitable distribution of water and water use efficiency was very important.

x) Technology Mission on Rainfed Agriculture should be established.

5. **Livestock and Fisheries**

i) Policy for livestock feed and fodder security system must be developed in each State.

ii) Poly clinics (Agro –Veterinary) should be established in remote areas.

iii) Since dairies of improved breeds of buffaloes were around big cities, no care was being taken for the maintenance of calves and heifers of buffaloes due to high rearing cost. Free/ subsidized land with financial support from the govt. may be provided to landless/ small farmers/ NGOs to rear them for their benefit.

iv) There was need to promote traditional varieties, modernize them and to motivate farmers for rearing domestic livestock.

v) There should be provision of compensation for crop production losses due to stray cattles.

vi) Unproductive animals should be castrated.

vii) There was a need to setup a National level body for intensive enquiry during the last five years of the progress of various corporations before constituting Livestock Feed Corporation.

viii) Subsidy for calf rearing was necessary for improved varieties.

ix) Livestock insurance should be expanded.

x) Outreach and extension services are very poor. Training of farmers in Animal Husbandry was required.

xi) Use of agricultural equipment with Bullocks should be subsidized.
Law about National Parks being open for grazing should be reviewed.

Farmers should be given free of cost vaccination, mineral mixture, deworming and A.I. for breed improvement.

Farmers should adopt animal husbandry as it is less affected in comparison to crops during drought and heavy rains.

Poultry should also be added in the list of assets.

Policy of livestock feed and fodder security system should be developed in each state.

Fishermen require credit cards and insurance for animal husbandry.

River ranching was needed.

Each train should have a refrigerated compartment.

OBC fishermen should get same level of subsidy as SC/STs.

Assistance was required for pre-harvest operations in fisheries.

6. Research, Extension Technology and Input

There was need to suggest to farmers regarding which farming system they should adopt according to availability of resources with them so that farmers could get assured income on per day, weekly or monthly basis.

Lac cultivation, sericulture, mushroom cultivation, bee keeping and floriculture needed promotion for livelihood security.

Appropriate infrastructure in villages be developed for enhancing the quality of seeds preserved by farmers.

Policy for development of seed security systems and buffer stocking of quality seeds was needed.

GM crops and Bio technologies should be promoted through public sector organizations. GM seed certification procedure should be looked into.

We should not depend too much on costly seeds.

There was a need for introduction of anti bio-piracy regulatory systems.

No work had been done in traditional knowledge.

There was a need to intensify the research related to organic products and to introduce National Organic certification Process so that it cost less as compared
to international certification. Farmers should be trained in the process for getting international certification of their produce.

x) There should be subsidy on organic fertilizer. We should certify organic fertilizer for domestic market also.

xi) Several bacteria could be investigated for bio fertilizer. More research was needed for this.

xii) Govt. should ensure timely availability of inputs to farmers at appropriate prices. Remunerative prices should be ensured to the farmers based upon their costing. Efficient monitoring system was needed to be developed for ensuring quality inputs to the farmers.

xiii) Agriculture judiciary should be constituted to solve the problems related to supply of sub standard or fake inputs and compensation to farmers. These cases must be solved within the crop season.

xiv) There is need to establish more and more labs by autonomous or private agencies for testing the quality of inputs used in agriculture. Timely availability of high quality inputs must be ensured.

xv) Contributions made by the farmers should be acknowledged by scientists.

xvi) The technical dominance of the Agriculture Department was diminishing as the farmers receiving advice from private sector.

xvii) Tractorization led to displacement of labour. This should be studied.

xviii) Inputs should be available at Panchayat level.

xix) National Horticulture Mission (NHM) should be implemented in a well planned manner with timely evaluation. Dryland Horticulture should be given importance in NHM.

xx) Lack of extension was hampering horticulture.

xxi) Government should not dictate what should be grown where in NHM.

xxii) The outreach and reverse feedback of departments and university was very poor.
7. **Credit and Insurance**

i) Complete list of farmers who had committed suicide needs to be prepared. Their complete socio-economic profile should be studied and “Debt Relief Board” should be constituted to provide relief to the farmers. Unproductive utilization of credit should be checked.

ii) Indebtedness was high due to high spending on inputs and lack of control over prices.

iii) 73% of farmers depended on moneylenders. Car is available at 0% interest but tractor loan is available at 14% interest.

iv) Farmers should get loan at 4%.

v) Banks should have consultancy services for farmers.

vi) Actual implementation of crop insurance scheme was very poor.

vii) At present G.O.I was providing subsidies (7 % interest) to RRBs and thus loans to farmers may be provided at lower interest rates i.e. 4 %.

viii) Agri clinics must be supported by direct finance at a lower rate of interest

ix) Institutional sources should be expanded or new branches should be opened for lending credit to more and more farmers. Experienced agricultural scientist should be employed for sanction of loan and timely training on various schemes of State and Central Govt. should be provided to them. Bankers could involve retired officers of Agriculture Department to sensitize them.

x) There was need to develop separate Agriculture Insurance Scheme for the Scheduled Tribes as they do farming in very harsh conditions and exposed to more risk.

xi) Crop insurance scheme should be improved.

xii) Co-operative election should be conducted by EC. The cooperative Banks and other cooperative credit institutions should be strengthened.

xiii) Vaidyanathan Committee recommendations should be implemented by banks.

xiv) MP was the only state which had consented to Vaidyanathan Committee Recommendations but implementation of these Recommendations was slow.

xv) Kisan Credit Card for women could be given if there was a Credit Guarantee. Guarantee was needed not only for deposit but also for credit needed.
Subsidy for failed well was needed.

Bankers were generally slow in issuing credit to the farmers.

8. Market, Distribution & Trade

i) Farmers did not have the right to decide their price based on their costs.

ii) Central and State agencies should provide assured markets to the farmers for their produce.

iii) MSP should be declared for all crops and before onset of sowing season. Premium price support must be provided during crises.

iv) Self Help Groups may be assigned quality seed production, value addition and their marketing.

v) There was a need to strengthen the marketing intelligence, agro-parks and an agricultural expert in the foreign embassies for providing proper marketing intelligence.

vi) A policy for market intelligence and support system for organic production must be developed.

vii) MSP should be differentiated. Special price should be given for ‘Sharbati’ variety compared to ordinary wheat.

viii) There was a need to establish a market like that in Chandigarh where farmers could sell their produce directly to the consumer and entry of middlemen was prohibited. Action should be taken against middlemen if they restricted farmers from selling their produce in these markets.

ix) Farmers produce should be procured at remunerative prices (20 percent dividend plus average cost) in place of Minimum Support Price. The farmers should get foodgrains at prices lower than prevailing in Public Distribution System as farmers were big producer and consumer too.

x) The farmers should be motivated to establish small processing units and products should be marketed by NAFED, MarkFed, Agro, Food and Public Distribution System.
xi) Resolution should be prepared to protect interest of the farmers involved in contract farming and it should be flexible enough from the farmer’s point of view.

xii) A white paper may be issued on Futures Market to make available the information on its benefits and losses and a study should also be conducted to know how much loss farmers incurred due to it.

xiii) Forward trading in food grains and agricultural commodities should be stopped. In case of ‘guargum’ trading was disproportionate to production.

xiv) Govt. should provide timely and assured market for the produce of ST farmers.

xv) Terms of Reference of the Commission for Agriculture Costs and Prices were not upto the mark as one of the TOR of CACP inter alia was that prices of agricultural commodities should be fixed keeping in view the poor consumer of the nation which was against the farmers. Govt. should fix two prices for the same commodity, one which was beneficial to the farming community and another for poor consumers. CACP should be reconstituted involving 2 to 3 farmers as Members. Close surveillance of the soaring prices of the inputs, variation in production and cost differences, transportation costs and impact of WTO should also be taken into account.

xvi) Agri-Export Zones (AEZs) need to be promoted for exports of agricultural commodities by providing assured markets to the farmers.

xvii) Traders normally decide the price and farmers have no say. Middlemen charge 8% commission in Mandis. In Mandi taxes have to be paid by farmers for everything. ‘Aarhat’ was charged on garlic.

xviii) 50% grant should be given to well working Mandis. NABARD provides subsidy of 50% to private sector but only 25% to mandis.

xix) Mandis should have right to make rules themselves without political interference.

xx) The arrangement between the ITC and Government for licensing was not known. There should be a control on them also. ITC etc may exploit once they were in monopoly.
Marketing in tribal areas should be with Mandis Samiti. Representation of Mandis should be there in all district monitoring bodies.

9. **Youth and Farming**

i) Agricultural graduates should be trained as entrepreneurs. Problems in implementing Agri-clinic scheme should be rectified.

ii) Conditions and working style of Agriculture Department in the State was not upto the mark and therefore intelligent youth of the village should be engaged as agricultural development agent. The farmer who wins first prize for his contribution in the field of agriculture at block level should be nominated as Member, Janpad Panchayat, Zila Panchayat, Legislative Assembly for a period of one year.

iii) Agro-Entrepreneurship was not developed because there was no assured marketing.

iv) Agriculture Entrepreneurship may be empowered to act as second tier extension.

v) Banks should give priority to agriculture background while lending in rural areas.

vi) Bankers did not visualize aspiration for a quality life in rural areas.

vii) Training of rural labourers was very necessary.

viii) Youths were not utilized in villages due to lack of infrastructure facilities. Their peers toiled much less for more returns in urban areas.

ix) Panchayat Members could not be trained as farm managers. The agriculture graduates may be trained as farm managers.

x) We should recognize youth and give them responsibility making them agents of growth.

xi) “Krishak Mitra Yojna” should be launched by selecting one educated person at each village for promoting agricultural development activities in the village.
10. **Rural Energy**

Policy on energy component was missing. Alternate source of energy as well as electricity must be made available for agricultural purposes on priority basis.

11. Chairman, NCF, along with Members, separately held discussions with Hon’ble Chief Minister, M.P. and Ministers in charge of Agriculture, Cooperatives, Animal Husbandry and Fisheries. Hon’ble CM recommended that interest rates for farmers should be reduced. Most of the cooperative banks did not have eligibility for free finance and in view of the three-tier system of cooperatives, their lending rates tended to be higher than that of commercial banks. It was mentioned that in spite of agreeing to the Vaidyanathan Committee recommendations, the state had not received any benefits yet. He also felt that interest should not be charged by banks on overdue interest. Turning to problems of fishermen, he pleaded that traditional fishermen should be getting the facilities available for SC/ST. Inland fisheries should also get the level of help being provided to marine fisheries. Fishermen should get liberal credit. He felt that the MSP recommended by the CACP were very low and announcements were not made well in time. He pleaded for 75% subsidy for drip irrigation to improve efficiency in use of water. He felt that four crop-cutting experiments instead of eight should suffice for assessing damage to crops. A reference was made to the launch of a Khet Talab Yojana for providing life saving irrigation to farmers in rainfed areas. Lastly, he informed that the state had decided to set up a State Farmers’ Commission and was also going to rename Agriculture department as Department for Farmers’ Welfare and Agriculture, as recommended by the NCF. Lord Balram’s birthday would be celebrated every year as Kisan Divas. Chairman, NCF, thanked Hon’ble CM for the courtesy shown to the NCF team.
STATE LEVEL CONSULTATION OF MAHARASHTRA FOR FEEDBACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT NAGPUR ON 1st MAY, 2006.

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the College of Agriculture, Panjabrao Deshmukh Krishi Vidyapith (PDKV) at Nagpur on 1st May, 2006. Prof. M.S. Swaminathan, Chairman, NCF was accompanied by Shri Y. C. Nanda, Member and Ms. R. V. Bhavani, Director (Technical). Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Universities and ICAR Institutions, Bankers, officials of State Govt. and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:

2. General Suggestions and Observations

i) The deficiencies in rural infrastructure like energy, roads and communication were highlighted. There should be proper all-weather roads to bring the produce home.

ii) Concern was expressed that both renewable and non-renewable energy sources were incapable of meeting demand for electricity for irrigation and other purposes.

iii) Enquiries about alternative energy sources like bio-fuels were also discussed but it was also felt that the land requirement was very high and often income to be generated was exaggerated.

iv) Farmers complained that bribe had to be given for inclusion in the BPL list.

v) Due to declining predator population the threat of attack from wild boars had increased. These were causing widespread damage to crops. The Wildlife Protection Act must be reviewed to enable some solution to address this problem. There should be compensation for crop damaged by wildlife attack.
vi) There should be thrust on organic farming in the region; inspite of huge investment on chemical farming, farmers were not getting adequate return.

vii) There should be taluka and district level farmers’ associations.

viii) Representatives of farmers should be there in the Vidhan Sabha and Rajya Sabha.

ix) Like Govt servants, farmers also need financial security.

x) Crop-livestock integrated farming should be introduced in the region.

xi) Healthcare facilities in villages is very poor.

xii) There should be village-level storage facility to prevent distress sale.

xiii) Farmers should also be provided with appropriate schemes for insurance, pension and old age support.

xiv) Most cooperatives had degenerated with control by vested interests; a major overhauling is needed with a fine blend of autonomy and regulation.

xv) A Farmers’ Welfare Fund should be setup to be used for meeting crisis situations.

xvi) Lot of agricultural land is being usurped by industry without adequate compensation. Owners are given promises of jobs that never materialize.

xvii) Counseling Centres maybe setup to provide advice and counseling to farmers in distress areas.

xviii) There should be both Land Use and Labour Use Policy.

3. Cotton Farming

i) The difficulties faced by the cotton farmers in the Vidarbha region like low productivity, high input cost, lack of marketing infrastructure etc. were discussed in detail.

ii) The Cotton Corporation of India and the Mill Federation did not honour their promises to the farmers. They bought locally only if it was cheap. Otherwise cotton is imported.

ii) The NCF recommendation to increase import duty on raw cotton to 30% had not been accepted.
iii) While the input cost rose 6 times due to rise in prices of the pesticides, seeds etc. the output prices remained the same in Vidharbha.
iv) It was also felt that sugarcane was the favoured crop and there was an inherent bias against cotton farming.
v) The importance of setting up processing units in the region was emphasized.

4. Inputs
i) Farmers complained that the power supply was highly erratic which led to the burning of motors.
ii) Several irrigation projects awaited completion in the region.
iii) The waiting time for connection to energize pumps was really long.
iv) The issue of failed bore-wells was also raised.
v) In Chandrapur the conflict between irrigation project and forest conservation was highlighted. Part of the project is through forest area and it is therefore lying incomplete. A study on the subject carried out by Drs. Rani Bang and Prakash Amte was mentioned.
vi) There was shortage of agricultural labour. It should be ensured that agricultural labour gets the statutory minimum wage to encourage labour retention; The minimum wage for agricultural labour should be as per the 6th Pay Commission recommendation for IV class staff.

vii) Quality inputs should be made available at affordable price.
viii) Farmers should be encouraged to keep their own seeds.
ix) Terminator technology for seeds should not be allowed.
x) Soil health enhancement should be taken up to enhance productivity.
xi) Seed cost is very high. There should be safeguards in the Seed Bill to ensure that farmers are allowed to use their own seed.

5. Credit and Insurance
i) A number of credit related issues were raised. It was pointed out that interest payments were far greater than the principal amount.
Questions were raised on whether the cutting down of the layers of the cooperative credit structure will help.

Stakeholders complained that the bank staff was not available after 5 p.m. when it was convenient for farmers and their behavior was rude.

Farmers’ debt should be waived; when banks can help loss-making corporations, why not rehabilitate farmers.

Credit should be given at less than 4% interest rate.

Agri graduates should be given subsidy to start agro-units at village level.

Crop insurance coverage is poor. Farmers lack information.

Insurance compensation takes a long time in coming; does not provide relief at time of need.

Indebtedness is the main cause of farmer suicide.

Just interest rate reduction will not solve the problem; total restructuring of loans is required.

Separate provision should be made in the budget for payment of premium and compensation to farmers.

The concessions given for industrial loans are not extended to farmers.

There should be a loan window with provision for personal consumption loans for farmers.

6. Market and Price

The Purchase Centre set up by the government did not work. The general perception was that the intervention of State was not strong enough.

Opening of Purchase Centres should synchronise with harvesting of a crop and number of centres should be increased; Payment should be prompt and there should be safe storage facility available in case of delay in purchase.

MSP should cover cost of production; It should be decided State-wise because cost of production varies from State to State.

Import duty on cotton should be increased.
7. The Members assured the full consideration of the suggestions received and the written representations made by the participants. They also thanked the PDKV and State Government for the courtesy shown.
STATE LEVEL CONSULTATION OF MAHARASHTRA & GOA FOR FEEDBACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT PUNE ON 5th SEPTEMBER, 2006.

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Pune on 5th September, 2006. The NCF was represented by Prof. R.B. Singh, Member, Shri Atul Sinha, Member Secretary, Dr. (Ms.) Chanda Nimbkar, Member, Part-time and R.V. Bhavani Director (Tech.). Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The Pune Declaration of a workshop of NGOs organised in Pune on Aug 18-19 to discuss the Policy was also highlighted at the meeting. The major suggestions/issues raised during the Consultation were as under:-

2. General Suggestions and Observations

i) Agriculture is an activity in the service of the nation – it is an investment not an expenditure and should get due attention. We need a separate agriculture budget.

ii) There should be a model farm in each district and even taluka if possible.

iii) Promotion of farm tourism can be one of the measures to attract and retain youth in farming. It also adds dignity to the life of the farm labour.

iv) The definition of ‘Farmer’ should be qualified as one who remains in the field for more than six hours.

v) Service providers i.e. ‘rural artisans’ who cater to agricultural needs in villages should also be included in the definition of farmer.

vi) SEZs should be established only on waste and barren lands.

vii) We need reorganize policies.
3. **Land – Livestock**

i) Soil health programmes should indicate extant government schemes and integrate the same with soil testing as follow-up action.

ii) Integrated farming model is required to increase productivity.

iii) Dry land agriculture needs special attention and allocation.

iv) Farmers need advice on what to grow where.

v) Farmers whose land is taken for other use have to be compensated adequately.

vi) The pressure of population on land has to be reduced.

vii) There should be a ceiling on fragmentation of land holding.

viii) Land reform implementation and land rights protection should get priority.

ix) Saline land reclamation needs agency approach.

x) Boundary dispute is one of the most contentious litigation issues among farmers.

xi) Vaccination information for livestock should be disseminated on polio campaign mode.

xii) The recommendations of the Dhariya Committee on Wasteland Development should be implemented.

4. **Water**

i) Micro watershed planning is needed to reduce the vagaries of monsoon. The Pani Panchayat model should be promoted in drought prone areas to retain water.

ii) The energy supply component is crucial for effective irrigation and needs attention.

iii) In the name of public property, ownership over water is being hijacked.

iv) Water consumption should be determined as per agro-climatic condition. Crops like sugarcane and paddy should be grown only in high water areas.

v) There should be water budgeting at the village level and attention to drinking water availability as well.

vi) Artificial ground water recharge and rainwater harvesting should be promoted.
5. **Research, Technology & Training**

i) The benefit accruing to farmers from research should be one of the criteria for evaluating performance of scientists.

ii) Farmer – Educational institution linkage should be promoted with students coming to work on farms during peak periods like the harvesting season when there is shortage of farm labour. In Israel, schools give a break for this purpose.

iii) Weather prediction and disease forecasting has to improve at the micro-level. As on date only the grape and potato Research Institutes have disease-forecasting facility.

iv) Community and FM radio should be popularized and promoted for technology dissemination.

v) Very little digital content is available in the local language for farmers to access.

vi) Organic Farming should be included in the educational curriculum.

vii) Promoting Post Harvest Technology wing in KVKs also requires making provision for additional manpower to handle the task.

viii) Agricultural education should not be restricted to those who have land only. In Maharashtra, those who have land get greater weightage in the admission process.

6. **Input Supply**

i) Farmers’ Clubs can promote cooperative or contract farming and hire out agricultural implements and supply inputs.

ii) The Seed Village Concept should be promoted to ensure availability of good quality seeds. Small farmers undertaking seed production should get bank assistance.

iii) Government companies meet only 10% of seed requirement. The rest is in the hands of private companies.

iv) Minor pests have become major and pest control companies are making hay.
7. **Fisheries**

i) Aquaculture should be treated on par with agriculture.

ii) Fishery exports should be exempt from sales tax as they are earning forex for the country; Export prices should be assured.

iii) The Murari Committee recommendations on uniform fuel rate and taxation levels should be implemented.

iv) The NFDB should have at least 3 fishers on the Board, to represent the interests of all the nine coastal States.

v) Leasing Policy of reservoirs should be uniform across the country.

vi) Closed period allowance should be more than what was recommended.

vii) Fuel station for trawlers should be close to point of vessel parking. The Coastal Zone Regulation (CZR) should permit this or Fishers’ Societies should have permission to store fuel, so as to prevent cost incurrence on transporting fuel.

viii) CZR should not apply to small fishers.

8. **Credit and Insurance**

i) There is no insurance for vegetable cultivation.

ii) Banks don’t reach small and marginal farmers.

iii) Crop loans should be sanctioned on yearly basis instead of for just the cropping season.

iv) Land Development Banks should be revived.

v) Lower rate of interest on credit will require interest subsidy.

vi) Farmers availing credit should not have to pay stamp duty on documentation.

vii) The formal credit institutions do not treat the farmer with dignity and the procedure for lending is cumbersome.

viii) Banks levy charge for issuing NOC – this should not be there.

ix) Cooperative credit societies do not extend credit to fishers.

x) Banks should have database of farmers with less than 3 acres land holding.
xi) Ideally any farmer who approaches a bank should be allowed to open an account and extended credit as per ceiling fixed for different land holding categories and landless, with minimum documentation requirement.

xii) There should be insurance cover for crops regardless of whether the farmer has availed of credit and also life insurance cover for the farmer.

9. Price and Market

i) Price of produce should be decided in accordance with cost of production.

ii) Like Special Economic Zones, we should have ‘Special Agriculture Zones’ with supporting centralized infrastructure facilities like storage and quality testing.

iii) When there is excess supply of a commodity, we should have the necessary information and tie-ups in place to export.

iv) There should be direct farmer-consumer linkage with transparency in sale and reduction of intermediaries.

v) Farmer needs advice on what can be sold where.

vi) Advance MSP needs to be fixed for commodities and perishable crops to enable farmers to decide what to grow.

vii) All weather road connectivity should be available to enable farmer to transport his produce to the market.

viii) Farmers’ Markets should be promoted.

ix) Measures like giving preference to fruit juice over coke in tender applications will promote agro-processing activity.

10. Women in Agriculture

i) Joint patta in land ownership should be implemented.

ii) Women farmers need concentrated training and capacity building.

iii) Women SHGs can be engaged in seed production on State farms.

iv) Women’s entrepreneurship should be promoted in specialized areas like floriculture and medicinal and aromatic plants.
11. **Extension and Dissemination**

i) Success stories should be widely publicized. There should be at least one successful model in each Block.

ii) Effective innovations should receive priority attention.

iii) There should be coordination between the different departments dealing with agriculture, technology and food security like, Departments of Agriculture, S&T and Health.

iv) Farmer-Scientist Interaction Forums should be promoted – ‘Krishi-Vigyan Mandal.’

v) Interface between progressive and common farmer and exposure visits will promote farmer-farmer learning.

vi) There should be Help Desk Centres with farmer grievance officers and Information Centres equipped with database of farmers in the local language, whom farmers can approach easily.

vii) There should be district level extension education centers with full-fledged team of agriculture specialists.

12. **Governance**

i) Agriculture department should be allowed to handle only responsibilities related to agriculture information outreach and implementation and not saddled with other non-extension activities and administrative responsibilities.

ii) Motivated staff should be recognized and encouraged.

iii) Horizontal integration in extension is not good – a change in approach is needed.

iv) Budget provision for agriculture has to increase.

v) Departments should be more sensitive and responsible. A system of monitoring has to be brought in place.

13. After the Consultation session, Members of the NCF assured the full consideration of the suggestions received and written representations made by the State Government and participants. They also thanked the State Government for the courtesy shown.
STATE LEVEL CONSULTATION OF ORISSA FOR FEEDBACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT BHBANESWSAR ON 28th JULY 2006.

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Bhubaneswar on 28th July 2006. The NCF was represented by Shri Atul Sinha, Member Secretary, Dr. R.B. Singh, Member, Shri Jagadish Pradhan, Member, Part-time and Shri G.C. Pati, Joint Secretary. Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

2. General Observations and Suggestions

i) The electricity distribution companies are showing complete apathetic attitude for supplying power to farmers. While electrification for industries and urban areas is being taken up on priority, the same for agriculture is often delayed. Moreover, the cost of electrification is prohibitive. If a farmer wants to take electricity line to his field, he has to pay for the cost of poles, which he cannot afford. Therefore, electrification to farmers’ field should be subsidized to boost agricultural production.

ii) ICAR was urged to establish a sugarcane research station in the State.

iii) There is lack of co-ordination between various Departments involved in farmers’ affairs. For instance, release of water in canals by Irrigation Department is not done as per the advice of the Agriculture Department. Hence, coordinated efforts of all related Departments related to agriculture should be ensured.
iv) There should be single window facility for attending to the works/ grievance of farmers rather than directing a farmer to go to different agencies.

v) Some farmers (particularly younger ones) stated that the Banks, Govt. officials were not extending respect/courtesy due to the farmers. The issue of dignity of farmers was highlighted as an important problem.

vi) There are many schemes in agriculture sector involving farmers, but the farmers and other stakeholders are hardly aware of them. Moreover, frequent changes made in the schemes & the guidelines are detrimental to the overall growth of agriculture.

vii) Mass production of a particular agricultural produce in a cluster should be encouraged. But contract farming should not be encouraged, as it is not farmer friendly. Entire State should be covered under ‘Organic Farming’ instead of encouraging it in certain zones.

viii) Agriculture should be given the status of industry in true spirit. There should be agricultural estates with all required infrastructural facilities as is done in industrial estates/SEZs etc.

ix) Jeypore region of Orissa is famous for rice biodiversity. This treasure and heritage should be adequately conserved. Niche production and marketing of selected landraces/ traditional varieties should be actively promoted. Participatory breeding and protection of farmers’ rights should be strongly supported.

x) Development of infrastructure related to agriculture like drainage, road, market is necessary.

xi) Training and capacity development of farmers and SHGs of farmers to take up agro-processing/food processing industries and marketing of products should be encouraged in the Policy.
3. **Land**

i) The soil of Orissa is mostly acidic (about 70% to 80%) which needs corrective measures and it was suggested to use both chemical and organic fertilizers to optimize the soil health. This cannot be achieved by organic intervention only.

ii) Management of acid soils is crucial for Orissa.

4. **Water**

i) The State receives an average annual rainfall of about 1400 mm which is nearly 300 mm in excess of the country’s average annual rainfall. But, much of the water is wasted.

ii) Although the State’s irrigation intensity is 40%, scarcity of irrigation water and poor maintenance of canals/channels affects the area irrigated in several parts of the State.

iii) In coastal areas water logging was a major problem. Drainage facilities in water-logged areas should be developed to make the land agriculturally more productive.

iv) Efforts should be made to provide irrigation water in water scarcity areas by proper maintenance of canal system and installation of other efficient water use system.

v) Farmers should be associated while designing and executing minor and lift irrigation projects since the cost of such projects implemented through farmers is invariably less.

vi) Underground tube/pipe irrigation network to increase water use efficiency was advocated.

vii) The provisions for irrigation under Bharat Nirman could be made available for efficient use of water, for promoting micro-irrigation and for completing the several unfinished irrigation projects.

viii) Govt. of Orissa has introduced a scheme of Pani Panchayat for management of Lift Irrigation Points (LIP) for last 4 to 5 years. Once Pani Panchayats are formed, the LIPs are handed over to them and the Govt. withdraws itself totally.
from maintenance of LIPs, the farmers face lot of problems. Since the concept of Pani Panchayats is quite new, Govt. should ensure hand holding to the farmers’ Pani Panchayats for successfully operating the Lift Irrigation Points. A sizeable number of Lift Irrigation Points under the management of Pani Panchayats have become defunct reducing the crop coverage area substantially due to the lack of handholding support from Government after formation of Pani Panchayats.

ix) The primary right on use of water of any irrigation project should be with the farmers and only after meeting the irrigation needs the balance available water, if any, may be given to urban areas or the industries, which at present tend to get preference over farmers.

x) Coastal land and water integrated management; desiltation/dredging of rivers, particularly at the points of confluence with sea; management and utilization of waterlogged areas; linking of rivers within specified areas may be examined for long term solution to the problem of flood.

5. Livestock & Fisheries

i) Pisciculture should be adopted by the farmers along with paddy cultivation to make farming more profitable.

ii) CRRI demonstrations have shown that rice-fish-vegetable-livestock integrated farming could yield about Rs. 60,000 per acre. This model should be widely replicated.

iii) Accent on Aquarian reforms and appropriate water reservoir leasing policy was necessary.

6. Research, Extension, Technology & Inputs

i) One of the major problems of the farmers was getting high quality seed at right time. Supply of seeds by Govt. agencies is often delayed. When Govt. announces subsidy on seed in natural calamity affected area and such subsidized seeds are made available after sowing, the farmers are really not benefited.
ii) High quality seed, fertilizer and pesticide, essential for farming, must be made easily available to the farmers in time and in desired quantity.

iii) Proper technological know-how must be made available to the farmers in production of quality seeds so that farmers can produce high quality seeds in their own fields rather than purchasing the same with uncertainty about its quality from the traders.

iv) The Societies are not providing quality fertilizer/seeds and other inputs required by the farmers.

v) Large-scale exploitation and cheating of poor farmers is going on in the sale of fertilizers, pesticides and seeds etc. by the traders. The same item is sold to different farmers at different rates sometimes at 50% of the MRP (Maximum Retail Price). Therefore, an innocent farmer who does not bargain with the trader takes an article at a higher price whereas some other farmer may get the same article at a much lower price. Therefore, actual MRP should be written and quality of fertilizers/pesticides should be ensured.

vi) The agricultural extension in the State has become very weak due to large-scale vacancies and for other reasons. Farmers are not getting right information or advice in right time.

vii) Most of the farmers are using diesel and kerosene pump sets to irrigate their land. Therefore, special subsidy for agricultural use of diesel and kerosene was proposed by some farmers.

viii) The cost of inputs, labour rate and transportation charges have become so high that farming is gradually becoming more and more un-remunerative. Moreover, the MSP fixed for different crops does not ensure adequate returns to the farmers.

ix) Agricultural advice by the extension workers and scientists must be in tune with the need of the farmer. For example, paddy which does not produce straw should not be encouraged in rural areas where straw is a major requirement of farmers for house construction as well as for cattle feed.
x) At least one progressive farmer in every Gram Panchayat should be extensively trained by Govt. so that he or she can further train other farmers of his or her Gram Panchayat.

xi) Subsidy on fertilizer, pesticides, seeds etc. is benefiting the manufacturers and traders of these items. The farmer does not get any benefit. Therefore, instead of subsidizing fertilizer, pesticide, seed etc., the fund can be better utilized for fixing higher MSP which will directly help the farmers.

xii) Another suggestion was that rural women must be trained in capacity building and food preservation and their wasteland should be earmarked for development through women farmers. Cost-effective production and timely distribution of quality hybrid seeds must be ensured. Hybrid rice seed villages should be tried.

xiii) Production of hybrid rice in Orissa should be encouraged in view of its higher yield potential compared to best of HYVs.

7. **Credit & Insurance**

i) Availability of easy and soft credit from the banks in time was presented as a major problem. The interest on short-term crop loan to farmers has been reduced by Govt. of India to 7%. But the benefit is not available to the farmers since most of the Banks and Cooperative Societies are charging higher rate of interest.

ii) The procedure of processing the documents for crop loan should be simplified. The processing fees charged by various banks need to be minimized.

iii) The rate of interest and the processing fees for crop loan to farmers should not vary from bank to bank.

iv) Despite the shortcomings, the State has some successful experiences of loaning to farmers’ groups and to tenant farmers, and such experiences should be replicated.

v) The educational and health needs of the rural farmers must be taken care of by credit institutions along with their farming needs. Kalinga Kisan Gold Card scheme of the Govt, is a step in the direction of widening the credit canvas, but its outreach is still very limited.
vi) A long-term credit policy must be evolved which should also provide for credit stabilization fund in the event of rescheduling of loans.

vii) Customers’(farmers’) awareness should be enhanced on various credit and insurance schemes and their operation.

viii) Cooperative Societies account for about 70 percent of the loan disbursed to the farmers in the State, but by and large have failed to benefit the needy farmers.

ix) The State has adopted the Vaidyanathan Committee Report but is far from its implementation.

x) Crop Insurance Scheme was ineffective in extending benefit to the farmers affected by crop loss. Since block is a unit for determining crop insurance, many farmers who genuinely sustain loss because of un-favourable weather or otherwise do not get the benefit of insurance. Therefore it was proposed to make crop insurance individual based and all crops and plantations must be included under the Crop Insurance Scheme.

xi) The Compulsory Rice Insurance Scheme should be revisited and all major crops including horticulture and cash crops such as cotton and livestock should be brought under insurance umbrella.

xii) Though some progressive farmers want to venture into innovative agriculture, they are not daring to do so because of extremely high risk associated with it. Therefore, there is need for solid crop insurance backup for such farmers.

xiii) Nationalized Banks are not attitudinally helpful to the farmers. The schemes of NABARD have not benefited the farmers due to apathetic attitudes of Bankers.

8. Market, Distribution & Trade

i) Distress sale of agriculture produce, especially rice and vegetables, is a major problem, which affects farmers of the State. Lack of storage, preservation and agro-processing facilities were projected as the main reasons for inadequate marketing facility.

ii) Marketing infrastructures at every Gram Panchayat level need to be built linked to the areas of mass agricultural production.
iii) Farmers’ Federations may be encouraged to facilitate storage, marketing and processing. Simultaneously, farmers, particularly women farmers/women SHG members, need to be trained on food preservation and food processing skills so that it will not only prevent distress sale but will also add value to the produce.

iv) For cultivation of medicinal and aromatic plants, marketing is a big problem. Centres must be opened by Govt. to purchase the produces at appropriate rates from the farmers. At the time of glut, Govt. should itself purchase the agricultural produces at MSP.

v) Govt. of Orissa has amended its Agricultural Produces Marketing Committee Act thereby allowing contract farming in the State. Several farmers voiced that there is a risk of permanent damage to the agricultural field by contract farming through excessive application of inputs. The contract farming sponsorers will take away all the benefits and render the land of contract producer useless. Hence, if at all contract farming is to be encouraged, organic farming through contract farming should be encouraged.

vi) Minimum Support Price (MSP) must be fixed and announced before crop operation starts so that farmers can decide to go for a particular crop or not considering its MSP.

9. After Consultation session, Members of NCF held discussion with the Hon’ble Ministers of Agriculture, Co-operation and Fisheries & Animal Husbandry Departments of the State Government in presence of concerned Secretaries and other State Government officers. The Hon’ble Minister, Agriculture apprised the Members about various problems of the State and emphasized the following points necessary for developing agriculture in the State:

i) Enhancing land fertility and preventing degradation of soil was a critical factor.

ii) Optimum utilization of irrigation and rainwater for increasing irrigated area should be ensured. Delivery of water through underground pipe to improve efficiency be considered.

iii) Interlinking of rivers to increase irrigation potential may be examined by Govt. of India.
iv) In Science and Technology from laboratory to land and from scientists to farmers should be major focus. Access of farmers to biotechnology should be improved.

v) Reduction in consumption of chemical fertilizer and pesticides and balance between chemical and organic fertilizer to optimize soil fertility may be ensured.

vi) Contract farming and compact farming to enable farmers to tap larger market should be examined.

vii) Adequate market and cold chain facilities should be provided for benefit of farmers.

viii) Credit & Insurance System for farmers needs strengthening. For the purpose of crop insurance, Panchayat instead of Block should be the unit.

ix) Farmers be kept away from taxes like excise/VAT.

10. The Hon’ble Minister, Cooperation informed about the difficulties being faced by Cooperative Institutions in providing crop loan to farmers @7% p.a. as announced by Govt. of India. 3 tier cooperative structure requires additional margin of at least 3-4% over and above the rate of interest @ 5.5% charged by NABARD to the Cooperatives. Amendment of APMC Act was highlighted. Rule was being finalized. There is interest from a number of corporate organizations to take up contract farming in the State as per the amended Act.

11. After the Consultation session, Members of the NCF assured the full consideration of the suggestions and written representations made by the State Government and participants. They also thanked the State Government for the courtesy shown.
STATE LEVEL CONSULTATION OF PUNJAB FOR FEEDBACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT CHANDIGARH ON 24TH AUGUST, 2006.

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Chandigarh on 24th August, 2006. The NCF was represented by Dr. R.B. Singh, Member, Shri G.C. Pati, Joint Secretary and Dr. Deepak Rathi, Research Officer. Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

1.2 Finance Commissioner, Development, welcomed the participants. Member, NCF explained to the participants the broad recommendations made by NCF so far in its Four Reports and the objectives of this Consultation. He expressed satisfaction that Govt. of Punjab has already constituted State Farmers’ Commission as per recommendation of NCF. He explained that the main objective of recommendations of NCF was to improve the well-being and income of the farmers and to improve the agricultural growth rate to 4%.

1.3 The women farmers, other farmers, farmers’ organizations and other participants were requested to give their views on the Draft National Policy for Farmers proposed by NCF. Views expressed are summarized below:

2. General Observations and Suggestions

i) Subsidy should be targeted and need based according to time, place, quantity and be directly available to appropriate farmer in time. All the schemes of Central Government must have substantial subsidy components for providing proper and timely benefit to the beneficiaries.
ii) How to integrate responsibilities with Panchayati Raj Institutions? About 25 percent population in India were poor and underfed for the last 25 years. How this can be tackled should be dealt within this Policy.

iii) Whatever policies were decided in the interest of the farmers, it always remained on paper and never reached the farmer.

iv) Contract farming as a tool for reducing the distress among the farmers was not found successful as it was not beneficial till clear cut code of conduct could be decided in the interest of the farmers.

v) Govt. should provide twenty years of tax holiday for establishing industries near villages with condition that out of total employment generated 90 percent must be recruited from that locality only.

vi) Part time farming must be promoted; in Japan 87 percent population is involved in farming and about 90 percent income comes from non-farm employment.

vii) Recently foodgrain was imported by Govt. of India. A little increase in demand increased the prices of these commodities at international level. Hence a comprehensive Food Policy is needed.

viii) Farmers require continuous and quality electricity supply.

ix) To provide better health service, there should be one hospital with all the facilities for every 2-3 blocks. Mediclaim policy must be mandatory for every farmer and there should be 75 percent subsidy on it.

x) If Punjab would be saved, then the country would be saved as the State was contributing 22 million tonnes of foodgrains production every year and about 50% of it is procured for the national bufferstocking.

xi) Detailed report of the Commission was welcomed but concern was its implementation. The policy must impart the grassroot people. Therefore, it would have been better if Draft National Policy could have been prepared by bottom up approach rather than top down approach.

xii) Cooperatives like Gujarat must be promoted in the State also.

xiii) Provision of Award or recognition to the farmers at Govt. of India level should be considered.
xiv) For the last 2-3 years, no Punjab farmer representative had been invited to attend the pre budget meeting with Finance Minister, unlike the past practice.

xv) In the last fifty years, contribution of agriculture to GDP declined from 51% to 20%. But nearly 65% of the population depend on agriculture. Hence there was need to increase the investment in Agriculture and improve the share of agriculture in GDP.

xvi) Non-farm employment, good education and health facilities in rural areas must be the priority.

xvii) Indebtedness in Punjab has been rising fast.

xviii) Farmers of Punjab were bound to grow paddy for food security due to the pressure of Government but paddy should be produced on sustainable basis.

xix) Seed security and seed sovereignty must be maintained. PVPFR Act should be made farmer friendly.

3. **Land**

i) Deterioration in quality of soil and water was an area of concern in Punjab due to rice/wheat intensification. Specific Land Utilization Policy should be specified and enforced according to area specific crops. No agriculture strategy, which may deteriorate the quality of land, environment including other natural resources should be implemented.

ii) Fragmentation of land had resulted in underutilization of tractor – contract servicing of agriculture can be tried – cost will be reduced.

iii) It was necessary to save the agriculture land from other land uses. For housing development near cities/urban areas, multistoried buildings should be encouraged to save prime agriculture land.

4. **Water**

i) Ground water level in Punjab had gone down and is further going down at alarming rate, resulting in increase of cost of irrigation. Small dams/check dams
to increase irrigation potential should be encouraged and Ground water recharging should be taken up on priority.

ii) Fisheries may be raised in canal water. Dams should be constructed on Beas and Ravi rivers for recharging of ground water. Plantation for conservation of water should be undertaken.

iii) Efficient utilization of water was a basic issue. In UP, yield per ha of irrigated wheat is 2.8 m.t compared to 4.5 m.t in Punjab. In Orissa yield of irrigated rice was 1.5 m.t/ha which can easily be increased to 2.5 m.t/ha. If irrigated land productivity in these States can be increased, it would ensure better food security in the country. Punjab agriculture in that case would go for diversification.

5. **Livestock**

i) Scarcity of dry fodder in Punjab was hindering the development of livestock. Hence further intensification of livestock schemes would not be viable. Livestock farmers should be given concessional loans.

ii) Fishery should be encouraged in a big way in Punjab in view of its excellent potential in the State.

iii) Breeds like ‘Thai magur’ did not allow culture of indigenous fishes in the same pond, hence these should be banned.

6. **Technology**

i) Spurious Bt cotton should be checked and the SAU should help the farmers by releasing Bt varieties for increasing the productivity and income.

ii) Farmers should listen to the advice of KVKs and scientists as no revolution can take place through policy only.

iii) Bee keeping and Mushroom growers should be covered under the definition of the farmer and these activities should also be financed. Wolamite in bee keeping was similar to bird flu in poultry and attention be given to control in an effective manner.
iv) Environment and natural resources were precious but farmers committed mistake by over exploiting them. Therefore the policy should be area specific with emphasis on proper land utilisation and crop combinations to save precious resources and providing market with remunerative prices to the producer for various commodities.

v) There was an urgent need for contract servicing due to fragmentation of land since with small land holdings farmers can utilise only 25 per cent of the total capacity of the machinery available with them.

vi) Farmers were ready to go ahead with diversification but alternative crops must yield more or equal income to that from rice or wheat.

vii) Labour scarcity is a problem and there was a need for labour saving farm equipments.

viii) Bt vegetables were reported to be injurious for health. Europe and Canada had banned Bt vegetables. The SAU should ensure food safety of Bt. releases.

ix) Organic goods produced by the farmers fetched better price and income. This should be encouraged by the Government.

7. **Credit & Insurance**

i) Credit should be extended to women with the due share in the total credit allocated for agriculture.

ii) All interest dues should be waived as farmers were unable to service the interest.

iii) There was need to waive all the credit to the farmers, but this alone cannot solve all the problems of the farmers.

iv) Forty five per cent of the farmers were totally economically unviable and used credit for consumption because through agricultural activities from small piece of land as they cannot generate sufficient income to meet their basic needs. Hence there was need to provide consumption loan without collateral security.

v) Kisan credit card must be provided to the farmers to check bribe at banks.

vi) Private money lenders have tried to build social and human relations with their customers. But this kind of behaviour was not observed in case of nationalised banks. Hence change in mindset of bankers is required.
vii) The interest rate should be reduced to 4%. How to pull out the farmers from indebtedness without giving more credit should be worked out.

viii) Instead of Block, individual farmer should be the unit on the basis of which insurance cover is given.

8. Market

i) Farmers experienced difficulties in marketing mushroom and other agriculture products.

ii) For diversification of crop, market was the biggest problem. Contract farming would not be effective unless the market prices were fixed.

iii) Better market facility be created where remunerative price was assured to the farmers.

iv) Niche market for crops like “Basmati” should be encouraged. Even organic “Basmati” can be encouraged. “Basmati” should not be called as ‘Super Basmati’ as announced by some traders.

v) It was necessary to think about agriculture globally in the context of WTO. Govt. should not abandon WTO. Zoning for different areas depending on strength/ weakness like grapes in Maharashtra should be done for improving global competitiveness.

vi) No MSP for crops like Sugarcane, Pulses etc. was available for the farmers. MSP should be linked to wholesale price index. Procurement should be at market price higher than MSP and should be effected in time.

vii) Inadequate agro-processing capability was hindering diversification to oil seeds/pulses and other crops.

viii) Production of farm be planned and oriented as per market demand. In this context, food parks can prove effective.

ix) Level Playing field should be ensured in WTO regime. USA was giving high subsidy to agriculture compared to India. How can Indian product be competitive in international market should be indicated in the Policy.
x) Agricultural price and labour minimum wages were decided by the Govt. of India. Pay Commission should also look into the living condition, income of farmers and suggest the minimum pay for the farmers also.

xi) Organic farming can give more yield and higher farm income as compared to the ongoing chemical Agriculture.

xii) Agriculture farming should be treated like enterprise, not as a way of life.

xiii) Farmer of Punjab could not transport surplus wheat outside due to stringent provisions in 9th Schedule of Essential Commodities Act. It had acted to the detriment of interest of the farmers in the past.

xiv) PM in his speech on 15.08.2006, mentioned that farmer must get appropriate remunerative price from the market. This must be implemented.

xv) Value addition to agriculture produce by farmers was discouraged. Provision of license for setting up rice mill/huller was cited as an example. Due to all these and lack of access to market, farmers had lost heavily. Hence all loans of farmers be waived.

xvi) When there was shortage in production, Government imports foodgrain at higher price – against the interest of farmers.

xvii) One TV/Radio channel exclusively for farmers should be commissioned both at the Central and State level.

xviii) In contract farming detailed guidelines should be specified to protect interest of farmers.

9. Views of State Govt. representatives.

9.1 Views of Dr. S.S. Johl, Vice Chairman, State Planning Board, Govt. of Punjab suggested the following:

i) 45% farmers in Punjab were economically non viable due to small land holding even if entire loan was waived. Diverting them to alternative off farm employment was the answer. For that education was stated to be the most important factor. The farmers were at a disadvantage in Higher Education. For instance, only 3.7% of the students in the PAU veterinary College are from rural areas. Thrust in the next Plan should be “Rural Education”.
ii) Employment in industries of local persons should be incentivised fiscally so as to divert people from non-viable agriculture.

iii) Technology be developed for small farmers like organic farming in Cuba.

iv) Rs.17,500 crores loss (approx.) was incurred by Govt. in carrying huge stock of cereal and exporting about 35 million tonnes a couple of years ago, 90% of which was contributed by Punjab. Further, about Rs.14000 crores were spent for import of edible oils and pulses. Against this, had Punjab been provided with the requested assistance of Rs. 7400 crores, the state would have produced the quantity desired by the country and thus avoided the huge loss. With India’s entry into the world market for imports, the international prices are jacked up—hurting both India and other importing developing countries.

v) Drought loss in Punjab was mostly borne by industry due to power cuts etc., but crop (rice) yield increased, hence Punjab was not eligible for drought relief. Industrial loss be also considered for drought relief. Social loss for paddy produced by Punjab was about Rs.5000 crores per year mainly for using ground water, soil fertility etc. But most of the rice produced in Punjab was going to the deficit States.

vi) Farmer wanted quality electricity, not free power, which was ultimately costlier.

vii) Health service quality has gone down in rural areas. This should be improved.

9.2 Views of Dr. G.S. Kalkat, Chairman, State Farmers’ Commission, Punjab:

i) Financial condition of Punjab farmers had worsened; real income from wheat from 2001 to 2006 had declined.

ii) Definition of small and marginal farmers should be changed. Small farmers should be up to land holding of 4 ha instead of 2 ha. 70% of farmers were small with unviable holdings. These farmers be trained at Government cost for off farm occupations.

iii) Procedure of banks should be farmer friendly. This should be directed more towards small and marginal farmers to improve their income and to diversify the occupations.
iv) Indebtedness Act should be passed to register the village moneylenders and to fix a limit on rate of interest.

v) FCI did not pay to the farmers directly in Punjab. The payment was made through a system of commission agents. This should be changed and farmers be paid directly by FCI.

vi) Capital investment subsidy for small farmers would be more useful compared to subsidy on fertilizers, equipment, electricity etc.

vii) Crop diversification should be encouraged in Punjab urgently with following steps to prevent hydrological suicide:

   a) Law may be enacted to provide that there is no rice transplantation after 10th June.

   b) Diversified crops should be procured under MSP and for this purpose Price Stabilisation Fund be created.

   c) Agriculture for fuel like ethanol from maize or jatropha which will increase farmers’ income by about 20% even if the fuel from this produce is sold @ Rs.18 per kg, should be encouraged.

9.3 Other major suggestions of the State Government:

i) Small farmers need special attention from the commercial and cooperative Banks, which should ensure availability of cheap credit to small farmers in time.

ii) Diversification of paddy area to crops consuming less water should be encouraged in Punjab to arrest depletion of ground water.

iii) Special efforts be made to improve the quality of rural education.

iv) Production of bio fuel from crops like maize with processing facilities should be encouraged.

v) Price stabilization fund should cover losses incurred by Govt. agencies on account of procurement of the crops being promoted by Government.

vi) Criteria for drought relief should be based on the extent and time of failure of rainfall instead of the loss of production.
vii) Funds be made available for supply of quality fodder seeds, fodder conservation facilities and for supply of fodder to small dairy farmers at reasonable rates to improve livestock productivity.

10. After the Consultation session, Members of the NCF assured the full consideration of the suggestions and written representations made by the State Government and participants. They also thanked the State Government for the courtesy shown.
STATE LEVEL CONSULTATION OF RAJASTHAN FOR FEEDBACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT BIKANER ON 29th AUGUST, 2006.

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government and Rajasthan Agriculture University at Bikaner on 29th August, 2006. The NCF was represented by Shri Atul Sinha, Member Secretary, Dr. R.B. Singh, Member, Ms. R.V. Bhavani, Director (Technical) and Dr. Prabhu Dayal Choudhary, Research Assistant. Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

2. General Observations and Suggestions

i) Rajasthan’s north-western and western regions, comprising 11 districts covering 61 per cent of the total area and 40 per cent population of the State, form the "Great Indian Thar Desert". People there did not have any vocational skill/education. They were therefore not likely to benefit much from the growth of the economy. They would not benefit from trickle down effect unless they had some productive asset or marketable skills. Jobless growth was really joyless growth.

ii) Differentiation between the dryland agriculture and semi arid and arid agriculture was very pertinent issue for Rajasthan State.

iii) There was a need for recognition of progressive farmers, as they succeeded after facing many hardships.

iv) A State Commission on Farmers should be established.

v) Farmers should be educated and made aware of latest developments in the agriculture sector.
vi) Issues of farmers related to their suffering due to natural calamities, need for a support price for all the crops, education and training for farmers, role of women in animal husbandry, lack of good breeds, AI facility, need for formulation of direct farmer oriented schemes, establishment of laboratories for testing of soil and water, testing of fertilizer, pesticides at district level, regularization of forest land occupied by the farmers, continuation of subsidies on fertilizers, control on conversion of agriculture and pasture land into urban land and provision of land for pastures, by reserving community land for grazing of animals.

vii) Awards should be given to progressive farmers and innovative farm-women. There should be model farms in each district.

viii) There was a need to include agriculture as a compulsory subject in school education so that basic knowledge of agriculture and agro-based industries was imparted to all. A special effort was needed in this direction as farmers’ suicide rate had increased.

ix) For protection of farmers from natural calamities, integrated farming could be a good option.

x) Impact analysis for every programme should be conducted.

xi) Policy developed for Rajasthan may be developed as a policy for high risk category cropping system.

xii) Drought proofing had not been mentioned or discussed in the draft policy.

xiii) Village-level processing units should be set up by farmers and there should be tax concessions.

xiv) Decision on Farmers’ Policy or any Farmers’ Issue should involve farmers.

xv) Cultivation of dates may be encouraged in the desert areas; even agricultural labourers can be given date trees for backyard cultivation.

xvi) Just like roads, waterways are needed and should be planned for.

xvii) There was a need for a larger budget for agriculture.
3. Land

i) Higher subsidies for the construction of water reservoirs may be provided to encourage construction of larger sized reservoirs so that fisheries could be combined with traditional agriculture.

ii) Land along the national border was taken from farmers for use by the army, and very low compensation was paid to the farmers. In urban areas, if land is taken from the landlord, better housing facility is provided to him. This bias against the farmers’ interest needs to be mentioned in the Draft Policy.

iii) Special mention was needed regarding water logging problems in the draft policy.

iv) The disadvantages of flood irrigation should be explained to farmers.

v) Rights of tribal farmers over forest land that was occupied before 1980 should be regularized.

vi) Land mutation procedure should be simple. It costs Rs.5000/- currently. There should be a separate officer to handle it.

vii) BOT system of tree plantation may be introduced.

viii) Forest cover in the State is less than that prescribed.

4. Livestock

i) Establishment of Livestock Feed & Fodder Corporation should be useful for Rajasthan.

ii) As a measure to take care of animals during drought period, the ‘Goshalas’ may be strengthened for maintaining the animals surrendered by the farmers due to their inability to look after the animals.

iii) Public-private partnership in fodder production must be introduced.

iv) Development of elite herds and establishment of veterinary clinics on the line of agri-clinics well supported by helpline and ambulatory clinics are also the need of the State.

v) Heritage Gene Bank and progeny testing must be taken up as an integral part of livestock development.
vi) Fodder banking technology developed by the University under which feed blocks for animal consumption are prepared required less storage space and at the time of shortage of fodder, these could be used as alternative non-conventional feed.

vii) Livestock owners could be provided with subsidy, loan facility for green fodder production.

viii) Relaxation should be provided in Wildlife Protection Act/Cruelty to Animal Act as the problem of *Nilgai* in the area needs attention.

ix) Policy for input supply and vaccines for livestock may be developed.

x) Extension in animal husbandry should be strengthened by developing veterinary diagnostic laboratories and hospitals at each KVK in Rajasthan.

xi) Animal welfare programme, land use planning for various kinds of wasteland for the cultivation of forage crops were needed to prevent loss of animal during drought.

xii) Sheep migration was a serious problem in this region and it should be dealt with by developing alternate pasture lands so that the migration could be controlled to some extent.

xiii) Women’s role is predominant in milk production. But there are no special schemes to encourage this.

xiv) Pastureland should be clearly demarcated and protected in every village. It should not become wasteland.

xv) There are no slaughter houses for goats.

5. **Fishery**

i) Fish cultivation could be done in the running water of Indira Gandhi canal, which stretched up to around 600 kms and it could also be tried in low lying areas near the canal.

ii) Getting good seed for fisheries was a problem in this region, forcing fishers to get seeds which were not even of very good quality from private agencies at higher price from distant places.
6. **Research and Technology**

i) Inter-linking of rivers was a tangible solution to deal with famine in Rajasthan.

ii) Instead of talking about purely organic or chemical farming, we must talk of sustainable farming and the loan to the small scale agro-cottage industries should be free from interest.

iii) There was a need for post-harvest management including on-farm wastage, proper storage of grains because proportion of wastage was more than 25% which was very high.

iv) Model technology demonstration facility must be available at district level.

v) To check migration of rural youth to urban areas, provision of essential facilities like hospital, market in group of villages, quality evaluation centres for inputs and rectification of policy for digging of well and electric connection would be needed.

vi) Suitable dams should be constructed for water storage and conservation, and a Farmers’ Welfare Fund should also be created.

vii) The problem of saline water in the region, particularly for fruit growers should be attended to. Water testing facility is needed.

viii) Contract farming may lead to dominance of corporate sector in rural areas, which would not be in favour of the farmers.

ix) Post harvest management and value addition should be important components of the policy for farmers.

x) Farmers’ training colleges would be opened by the banks in the villages, and land purchase schemes should also be started for small and marginal farmers.

xi) There was a need for use of non-conventional solar and wind energy in agriculture, because the region has abundant untapped potential for these and the State faces acute shortage of electricity. The same could also be used for irrigation. Energy farming should be encouraged.

xii) Fodder production through watershed may be promoted and the banks of canal may also be used for this purpose.
xiii) Provision should be made for use of city waste water, water effluents of the industries; after treatment the water could be utilized for fodder development.

xiv) Agri-clinics and agri-business should be promoted and incentives must be provided for such schemes to make them popular.

xv) Theoretical as well as practical trainings were essential to utilize mustard crop in winter season for Bee-keeping.

xvi) Strategy should be planned to meet out the scarcity of feed and fodder at the onset of drought.

xvii) Research was needed on medicinal plants which could be used for producing medicines for livestock. Medicines and vaccines for most of the diseases were not available in proportion to animal population in the State.

xviii) Weather forecasting stations should be available at each KVK

xix) Trainings provided at KVKs should be job oriented.

xx) Harvesting of solar energy was the need of the hour.

7. Inputs

i) B.Sc. (Agri.) should be a mandatory qualification for the registration of shops meant for the sale of insecticides and pesticides.

ii) Supply of substandard agriculture inputs was a matter of serious concern.

iii) Subsidies should be directly given to the farmers than to the companies. Schemes should be encouraging the farmers and not the private companies.

iv) Fencing of horticultural fields should also be considered for the provision of credit or subsidy so that farmers could go in for plantation of horticultural saplings.

v) Subsidy should be extended to all suitable fruit plants for the area, and not only for a restricted list under NHM.

vi) Subsidy should be provided for diesel-based equipments on the basis of cultivable land and cropping intensity of the individual farm as well as the diesel for tractor fuel.

vii) Sale of seed should be against bill/invoice.
viii) Electricity connection should be prompt. Currently it takes about 2 years and wells fail in the interim.

ix) The many small rivers in the region should be harnessed through proper planning.

x) Mobile soil testing labs can be run through fertilizer companies.

8. Credit and Insurance

i) Agricultural credit procedure was very cumbersome.

ii) Subsidy should also be given on solar based pumping sets.

iii) The unit for the crop insurance schemes should be the individual farmer’s field rather than the tehsil or the panchayat.

iv) The rate of interest on agriculture loan including co-operative credit should be reduced.

v) Interest on farmer’s share money in the cooperative society should be provided.

vi) There was a need to rectify the anomalies related to agricultural loan recovery.

vii) A defaulting farmer is arrested and cell rent as well as food bill is also charged from his family and even his land is auctioned. His respect in the rural area suffers. Such harsh provisions do not exist even for criminals.

viii) Insurance should be available for horticulture crops also.

9 Marketing

i) Beneficial support price was needed for the crops.

ii) No market for Aloe and mushroom was available at local level, and farmers were discouraged from taking to these crops.

iii) Support price for animal products should also be fixed, because a large share of consumer expenditure went to the marketing/private agencies.

iv) Cheating by the marketing agencies, discouraged the farmers from taking up animal husbandry.

v) Cultivation of medicinal plants and the like should be under buyback mechanism.

vi) The Mandis should have farmer-friendly facilities.
10. **Technical Manpower**

i) Shortage of technical manpower was a serious problem and interfered with the execution of policies and extension work.

ii) Officers appointed should live in the villages and work with the farmers. Adequate infrastructure should be developed for this.

iii) Staff posted in Universities, are largely on contractual appointment and the commitment is not there.

iv) The Department of Fisheries is headed by a non-technical person.

v) There is no extension division in Animal Husbandry Department.

11. After the Consultation session, Members of the NCF assured the full consideration of the suggestions and written representations made by the State Government and participants. They also thanked the State Government and Rajasthan Agriculture University for the courtesy shown.
STATE LEVEL CONSULTATION OF TAMIL NADU, PONDICHERRY AND ANDAMAN & NICOBAR ISLANDS, FOR FEED BACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT CHENNAI ON 27th JUNE, 2006.

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Chennai on 27th June, 2006. Prof. M.S. Swaminathan, Chairman was accompanied by Shri Atul Sinha, Member Secretary, Shri Y.C. Nanda, Member, Ms. Mamta Shankar, Director and Ms. R.V. Bhavani, Director (Tech.). Farmers, Farmer Organizations, NGOs from Tamil Nadu, Pondicherry and Andaman & Nicobar Islands, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

2. General Observations and Suggestions

i) The current agrarian crisis has to be placed in the context of globalisation and its detrimental impact on agriculture and farmers.

ii) All Govt. departments should explain the extant schemes in the Gram Sabha Meetings.

iii) Need for separate section for dalit women farmers and workers, small and marginal farmers.

iv) Falling investment in agriculture, closure of State farms, is a cause of concern. Investment of more funds by Government in agriculture is needed.

v) The Seed Bill should be reviewed carefully before passing by Parliament.

vi) The PURA (Provision of Urban facilities in Rural Areas) model proposed by His Excellency the President of India, should be extended all over India.

vii) There should be assured income status for farmers.
viii) All parts of a crop should be put to use – with facility for value addition; e.g. we can get sugar and ethanol from sugarcane.

3. Land

i) Agricultural labourers be given 10 to 15 cents homestead land to prevent migration to other places in search of jobs; wasteland reclaimed maybe so distributed for this.

ii) Get back Government lands occupied by private persons.

iii) Need to consolidate lands for collective farming.

iv) Sustainable agriculture is to be achieved by proper fertility management of the soil. We should leave the soil to the coming generation to produce sustainable yield and eco friendly produce. For that we have to promote organic farming.

v) For social and cultural uplift of small farmers and agri workers, distribution of surplus lands is essential.

vi) As per the 9th schedule of the Constitution itself, one cannot challenge in the Court against Government taking over the lands.

4. Water

i) Implement interconnectivity of rivers to enable better water management.

ii) De-silt the tanks and ponds in the villages and deepen wells, to store rain water

iii) Deep borewell of big farmers affect the water yielding capacity of shallow wells of small farmers.

iv) Besides desilting tanks, new irrigation projects are to be taken up; the new irrigation projects in the villages can be implemented from Member of Parliament Local Area Development (MPLAD) funds.

v) Rainwater harvesting should be mandatory and tank rejuvenation should involve the local populace.

vi) Encroachment in riverbeds and construct check dams in the forest for improving ground water table should be removed.

vii) The rivulets in the hills are being harnessed by company estates, and small farmers are not able to use them.
viii) Promotion of sprinklers is needed in Nilgiris for better crop in water lean periods.

ix) There should be construction of separate canals for effluent flow to prevent contamination in Orathamalayam dam.

5. Livestock, Poultry and Fisheries

i) Cattle maintenance is not profitable with less number of cattle; a minimum of 5-6 cows is needed.

ii) Setting up of milk societies managed by SHGs can cater to local needs, generate income and promote local development

iii) Subsidy to be given for cattle rearing; availability of cattle feed; There is no support for dairy farming

iv) Abolish fishermen associations now headed by the non-fishermen and hand over to the Panchayat for better management.

v) Poultry should get status of agriculture

vi) Electricity tariff for poultry should be that for Agriculture. There is need for IT relief.

vii) Abolition of ST on poultry feed, formation of poultry development board, minimum support price for egg and chicks, abolition of tax on medicines are some of the measures needed.

viii) Inclusion of one egg daily in the noon meal scheme implemented in Tamil Nadu should be extended across India.

ix) Transport subsidy for maize used for cattle feed received from other States is needed for maize received for poultry feed.

x) The Namakkal region should be declared Bird Flu Free Zone to promote poultry exports.

6. Technology and Training

i) Transfer of technology and access to the technologies to the largely illiterate small and marginal farmers in the areas of soil health, quality planting materials and seeds, micro irrigation, water harvesting technologies to recharge aquifers,
plant protection, post harvest management through mechanization of harvesting, grading, cleaning, processing and packing is important.

ii) Enhancing the technical skills of extension workers is needed.

iii) Organic farming courses in the schools i.e. holistic training programmes are needed. This can be in collaboration with KVKs. Capacity building of grassroot innovators is important

iv) Train rural youth in post harvest technologies to increase shelf life and help generate employment.

v) For the controlled atmosphere ultra Oxygen technology may be used instead of cold storage.

vi) Advising farmers in growing location specific crops is essential and required.

vii) Mechanical planters are required to tide over scarcity of agricultural labour.

7. **CPR, NRM and Biodiversity Conservation**

i) Tanks, Village Ponds and Common Property Resources including pasturelands are to be safeguarded from the private companies.

ii) In some places, where the land ceiling has been implemented, a reversal is being observed. This is a dangerous trend.

iii) 65% of the income from the teak trees is to be given to Panchayat to grow more trees and cancellation of 2-C Patta for better revenue to Panchayat.

iv) Need to plant trees on important occasions and plant 1/3 rd area by trees for perpetual income in the long run.

v) Steps should be taken to get back the occupied pasturelands.

vi) The *Mandevali poromboke* lands should be brought from Panchayat and rejuvenated as pasturelands

vii) Revival of the pastureland is necessary to prevent the decline in household cattle and sheep population.

viii) Replanting of deforested area and planting of useful trees like Mango, Teak instead of Eucalyptus should be encouraged.
ix) Traditional cattle growing people of Yadava community in Manamadurai are conserving biodiversity by breeding Pulikulam traditional animal breeds. They should be recognized and supported.

x) The hill tribals are to be involved in Koottuvana Nirvagam (Combined Management of Forest). Eucalyptus is not to be grown.

xi) There should be restoration of Panchami lands and allowing cattle grazing in hill areas.

xii) Pasturelands occupied for residential purpose should be taken back; CPRs are getting eroded.

8. Food and Nutrition Security

i) Conversion of food cropland to non-food crop cultivation should not be encouraged for example by citing the example of Kerala, Tamil Nadu should not do so. On the contrary, incentives should be given to sustain land under food crop cultivation.

ii) Without compromising on food production, cultivation of horticultural produce is to be promoted. Incentive is to be given to the farmers to produce food crops and reduce import of wheat.

iii) There should be universal PDS, including 14 essential commodities under it. Foodgrain and dhal may be given as wages; Spread of Community Food Banks can help ensure safe and healthy food for all.

9. Plantation crops

i) Fix minimum rate for tea.

ii) Tea plantation should not be treated as industry; many small farmers are engaged in the industry; their plight needs attention.

iii) To have prosperous tea industry, the Auction Centre for tea at Connoor should be handed over to the local people.

10. Labour & Inputs

i) Constant vigil on the quality of seeds supplied by private sector is needed
ii) While MNCS were offered many perquisites, farmers are not even assured of uninterrupted power supply.

iii) With regard to GM seeds – we should work to make the price lower; China has for instance developed low cost Bt seed.

iv) Government agency can produce and sell seeds at cheaper rates.

v) Appoint a committee for pre-inspection of Private and Government nurseries while calling for the tenders. There is dire need for quality planting material.

vi) Farmers can earn more profit in pear grafting from the old pear trees instead of cutting down.

vii) With job guarantee, migration of labourers can be controlled.

viii) There should be some protection for migrant labour.

11. Island Farmers

i) Separate lands should be given to farmers whose lands were submerged after tsunami and turned saline and uncultivable

ii) Middlemen should be stopped from getting and marketing the agricultural produce.

iii) Rain water harvesting by constructing check dams is needed. Inspite of heavy rain for nine months, most of the water runs off.

iv) The loans of farmers who availed loans from banks should be waived to overcome the loss due to crop submergence.

v) Land patta should be given to the farmers who have been cultivating for years without proper patta.

vi) There should be cold storage facility on each Island.

12. Women in Agriculture

i) Women in agriculture devote time to agriculture, composting from cattle and poultry waste, etc. - need for training to women self help groups and establishment of agro-based industries.

ii) Equal wages to women, reduction in working time and more payment as noted in draft policy, should become reality.
iii) Need to give encouragement to the women self help groups by Government and take steps to reduce the crop loan interest now given at 9%.

iv) Revenue Forests are getting re-classified as Reserve Forest, squeezing the source of income for women from NTFP. Women should be allowed to gather forest produces to enhance their income.

v) Besides implementation of Kolappan Committee recommendations, women should be given training in irrigation methods, marketing etc.

vi) Under urban farming, flower and vegetable cultivation can be an income generation option for women.

vii) Alternate jobs for women are needed to prevent migration and there should be priority to women while making payments.

viii) Pressure should not be increased on women SHGs, by passing on responsibilities of the State.

13. **Credit and Insurance**

i) To prevent fleecing by private moneylenders, allocation of more funds to Government agencies at lower interest rate of 4% is necessary, to enable them to onlend.

ii) Credit to small farmers needs special attention;

iii) Under crop insurance, only loanee farmers are getting insured or benefited. Crop Insurance should be made mandatory, non-loanee farmers should also to be covered and the unit of assessment for damage should be changed from block to village.

iv) Adequate compensation is to be given for crop loss due to natural disaster.

v) Farmers need consumption credit. The KCC should be comprehensive, covering all purposes and all farmers should be eligible for it.

vi) Crop insurance should include coverage against pest and diseases.

vii) Health insurance for farmers should also be there.

viii) Crop loan interest rates are higher than housing loan interest rates.
ix) National Agricultural Insurance (NAI) is covered at block level. This year the Insurance Company came forward to cover at firka level. The farmers feel that the coverage should be at village level / individual field level.

x) Co-operative Societies should be revamped and LAMP Societies revived.

14. Market and Price

i) There should be affordable price policy and rational export and import policy to protect farmers’ interests.

ii) Cold storage facilities are needed to store the perishable produce like tomato.

iii) The role of MNCs in the entire chain from input supply to market should be carefully scrutinized and regulated to ensure that farmers’ interests are protected.

iv) The minimum support price should be extended to all crops.

v) Impact of Liberalisation, Privatisation and Globalisation (LPG), WTO negotiations and tariff imposition on farmers should be highlighted.

vi) Direct purchase by Government to avoid middlemen interference to prevent price fall is essential.

vii) State Price Commission should be setup to determine price locally and cover all crops.

viii) In contract farming, tripartite agreement between farmers, agencies and Government is needed; the purchaser is usually a MNC; a govt. representative should monitor and check.

ix) There is a need for farmers’ market.

x) We should have mechanisms to protect our produce; if production is low, we should not indulge in online trading.

xi) Daily market prices to be made available in local languages in electronic media.

xii) Income tax exemption should be given for floriculture Industry. Floriculture is not considered to be agriculture by the IT dept currently.

xiii) The NHB should give priority to perishable commodities. There is need for sub-committees under the NHB for this.

xiv) Export of onion should be stopped when there is shortage.
xv) Promotion of industries producing dried vegetables like bottle gourds, onion etc.
xvi) Support is needed for export of organic farming produce.
xvii) Government should intervene to ensure timely payment by the private sago factories.

15. **Policy and Governance**

i) Agriculture development funds are operated under mission mode and allotment given in two instalments - first instalment of 50% in the beginning and another instalment six months after getting utilization certificate. This should be changed to 90% in the first instalment and 10% in the second instalment to enable proper implementation. State Governments are not in a position to spend first and then claim.

ii) Seed replacement under paddy is 17% percent by the department, 33% is from private parties, 50% by exchange between farmers. Many times the Government of India funds are lower than the department’s need. So, Government of India should provide subsidy to all the stocks available.

iii) Hill area development projects should not be stopped.

iv) Need for contingency practices at policy level with minimum standards for disaster situations, coordination among different departments, e.g. in clearing of blocked irrigation and drainage canals, partnership with participants and intervention to be continued on sustainable basis.

v) The Geographical Indications Act should find a place in the Policy.

vi) Formation of State Trade Policy Council may be formed to act as a platform for discussion between farmers and the policy makers and officials from all departments of the State.

vii) Introduction of compulsory agricultural education in schools and measures to re-attract youth to agriculture are needed.

viii) Need for pension for farmers.

ix) The death of sheep due to Bt cotton consumption must be investigated.

x) Programmes and entitlements should reach people – information dissemination

xi) Safeguard traditional knowledge by paying royalty.
xii) Need for formation of Commodity Boards under the umbrella National Horticulture Board for better attention to individual crops. Grapes, Banana Turmeric and Chilly can be special thrust areas in Tamil Nadu.

xiii) Formation of agency to implement Minimum Wages Act is essential; there should be legislation for agriculture labour.

xiv) Panchayat and Gram Sabha may elect a body that can be registered and entrusted to handle the implementation of govt. schemes – this can be a SPV.

16. After the Consultation session, Chairman and Members of the NCF assured the full consideration of the suggestions made and the written representations made by the State Government and participants. They also thanked the State Government for the courtesy shown.
STATE LEVEL CONSULTATION OF UTTARANACHAL FOR FEEDBACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT DEHRADUN ON 20th JUNE 2006.

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Dehradun on 20th June 2006. The NCF was represented by Shri Atul Sinha, Member Secretary, NCF, Dr. R.B. Singh, Member and Dr. (Mrs.) Laxmi Joshi, Research Officer. Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

2. General Suggestions and Observations

i) Shortage of agriculture labour was being experienced in the hills particularly for horticulture crops since the labour had moved to cities where they found higher wages and better life style.

ii) More of infrastructure should be given top priority in the Uttaranchal particularly for roads in order to facilitate quick and efficient movement of its horticulture produce which was highly perishable. In view of poor industrialization in the hills and in view of Uttaranchal being a new State, its own resources were not adequate. Liberal Central assistance should be forthcoming especially through Bharat Nirman Programme of Prime Minister.

iii) There should be separate policies for the Himalayan areas and for the coastal areas in view of the uneconomic nature of the holdings.

iv) There was a need to prepare Village Plans based on local resources but this was not happening because of the poor PR set up in the State.
3. **Land**

i) The names of women should be recorded in the land records since men folk in the hill areas tended to migrate to cities for livelihood and their wives had to cultivate.

ii) Since the names of women were not listed, they could not access credit and other inputs.

iii) However, it came out that there were specific difficulties in recording the names of women and there were likelihood of long delays in mutation and getting the consent of men folk to the recording of the names of their wives. It also came out that there could be difficulties if the women were divorced or if they left the husbands on their own will.

iv) Land management policies should be drawn up for Uttaranchal keeping the fact that mostly women were cultivating such land. This would involve special extension programmes for women, general specific tools and implements, credit support for women as well as additional nutritional support in view of the burden on them to manage agriculture as well as home.

v) There should be a ban on plantation of ‘Cheer’ and ‘Pine’ trees in Uttaranchal since they drew too much ground water.

vi) It would be desirable to plant trees with wide leaves in view of the specific geographic climatic conditions in Uttaranchal.

vii) The limited land resources in Uttaranchal should be optimally utilized through the concept of Udyankunj where horticulture, animal husbandry etc. would be practiced in an integrated manner.

viii) The limited resource prime agriculture land may be conserved by severely restricting acquisition of such valuable land for non-agriculture purposes.

ix) Only 14% of the land was available in Uttaranchal for agriculture since the rest of it was covered by hills/forests. Further, huge parts of this agricultural land were lying fallow since some farmers had moved to the cities in search of jobs and livelihoods. This situation needs to be remedied urgently. This was because of scarce resource.
x) The afforestation programme of the Forest Department should provide for at least 30% of trees which had a nutritional value for their fruits/berries etc.

xi) Consolidation of land was of great importance in small holdings in Uttarakhand. However, the matter could be carefully examined in view of the possibilities of litigation and corruption.

xii) Voluntary consolidation through exchange of land could be encouraged by exempting stamp duty on such exchanges and quick mitigation of such exchanges at the level of Revenue Inspector.

xiii) Fodder crops could be planted on the borders of agriculture fields since enough wasteland was not available for fodder development and access to fodder in the forests was becoming a major problem.

4. Water

i) Excessive expenditure was being incurred for repairs of canals even when there was very little water flowing through such canals.

ii) Water and soil conservation techniques should be popularized among the farmers in the hills in order to check the silting of rivers and reservoirs down stream.

iii) Subsidy for rainwater harvesting schemes should be available to all farmers and not only for SC/ST.

5. Livestock

i) People in the hills had been traditionally relying on livestock like cows, goats and sheep for livelihood in view of the availability of fodder and grazing. This was however becoming scarce. Special programmes of nutrition for fodder development therefore have to be undertaken.

ii) There should be arrangements for baling of fodder through introduction of baling machines to conserve fodder for the lean season. There was also a strong need to enrich the fodder with molasses but it is becoming difficult to access molasses after the bifurcation of Uttar Pradesh as sugar mills were located in
Uttar Pradesh. It was mentioned that NDRI, Karnal had developed some alternatives to molasses for enriching fodder and this avenue should be explored.

iii) Fodder is often burnt and even used for exchange purposes in the plains while Uttaranchal did not have enough fodder for its use. Steps should be taken to optimally utilize fodder both in the plains and in the hills.

iv) There should be a strong programme of conserving local breeds in the hills because of their stamina and other attributes. Special mention was made of Red Sindhi breed of cow which had been taken away by Argentina and rebranded as Brahmini cow.

v) Uttaranchal was already implementing “ParaVet” programme in order to take care of artificial insemination and health care need of the livestock owners and this was giving good results. The fodder production programmes in Uttaranchal were suffering because of the presence of weeds like Lantana and Parthenium. Scientists should suggest methods of eliminating these weeds and using them for production purposes.

6. Fisheries

i) There was a need to set up a Fisheries Technology Mission with special focus on cold water fishery and aqua water in the hills specially for sports.

ii) National Fisheries Development Board which was being set up would have to give a special thrust to fisheries in the hill areas since there were limited livelihood opportunities through agriculture.

7. Technology

i) There was a need to design agricultural implements for women particularly in the hills through agronomic studies. While the Central Institute of Agriculture Engineering, Bhopal had brought out a compendium to agriculture implements, special designs for hill women community should be given greater attention.

ii) In view of the large scale wastage of horticulture produce from the hills, greater attention to development of technology for farm level processing was needed
along with support for marketing keeping the quality parameter and consumers’
demands in the cities in mind.

8. Inputs

i) Increased transport subsidies should be available from farm section to the rail
head in hill States like Uttaranchal in view of the high cost of transportation.

ii) Subsidies should be provided for organic fertilizers on the same lines as for
chemical fertilizers in order to encourage its increased use and also to encourage
production of organic fertilizers and vermi compost by women in the hills. Such
a subsidy is also encouraged for increased use of organic fertilizers for
improving soil health.

iii) Suitable tests should be undertaken for the toxicity and bio efficiency of organic
fertilizers.

iv) In view of the importance of organic agriculture in Uttaranchal because of the
very small or non-existence of chemical fertilizers, suitable facilities for
providing certification for organic crops should be provided. Such certification
should also be subsidized to enable smaller farmers also to benefit from
certification.

v) Uttaranchal had developed a good model for certification by setting up of State
Certification Agency which had a tie up with internationally recognized
agencies.

vi) The seed sector should also be free from VAT in order to encourage a higher
seed replacement rate and maintain the competitiveness of the seed produced in
the Tarai area.

vii) The subsidies available to the State Farm Corporation of India and the National
Seed Corporation should also be available to the Tarai Seed Corporation in order
to ensure a level playing field.

viii) Seed bags should mention the recommended seed rate for the guidance of the
farmers.
ix) A seed valley concept could have a great value for Uttaranchal but the idea coming was not feasible for subsidies from the State Government which was not forthcoming.

9. Credit

i) Kisan Credit Cards should be issued in favour of women since they were mostly cultivating the land in the absence of their men folk who had gone to the cities in search of work. It was suggested that a Power of Attorney and Indemnity Bond could be taken from the recorded farmers in favour of their wives to protect the interest of the banks who come to finance the women. However, it turned out that such POA had been banned in Uttaranchal in view of its misuse by outsiders for fraudulently depriving the farmers of their land at low prices.

ii) The target for distribution of KCC had almost been made and the entire State would be covered by the end of the year.

iii) While many Self Help Groups (SHGs) of women have been formed, they had not actively engaged in agri or other productive activities because of the absence of loans. Credit may be made available to the SHGs of women and the banking institutions should be proactive and lenient in such matters.

iv) It was noted that some women SHGs had set up nutrition gardens and were also engaged to produce seeds but adequate information about nutrition etc. was not provided to them.

v) There was then adverse credit deposit ratio in Uttaranchal and the savings of the people were moving out of the State since there was not much of industrial activities either in the hills.

vi) There was need for a separate credit policy for the hilly areas like Uttaranchal, J&K and Himachal Pradesh.

vii) Credit should become available as soon as new technologies were administered to the farmers.

viii) NABARD was not able to exercise adequate control on the loans by Finance because banks had their own funds and do not know much of refinance.
ix) The ICOR level of 2.2:1 in Uttaranachal was too high and there was very little capital formation in agriculture.

x) Most of the cooperative credit was being channeled in the plains whereas there was a great need for better outreach and greater flow in the hill areas.

xi) National Agriculture Insurance Scheme is currently available only for wheat, ginger, ragi, potato and tomato but was not benefiting the hill areas sufficiently.

xii) Banks were not deducting insurance premium while sanctioning loans to farmers primarily because the farmers did not see money gains in the scheme for them. This was primarily because of the units for crop cutting experiments and sanction of the system being too large.

xiii) The possibility of giving assistance to farmers on account of pending crop cutting experiments to help them immediately after a crop failure should be explored sympathetically.

xiv) Crop insurance and its present form was not farmer friendly.

xv) There were also procedural problems in sanctioning of loans and the simple people in the hills faced corruption and other difficulties.

xvi) The procedure for obtaining No Objection Certificate from various banks before a loan was sanctioned to the farmer was cumbersome and riddled with corruption. Outcomes should be clearly identified and specific responsibility should be fixed at all levels.

10. Marketing

i) Basmati rice whose home was in Dehradun valley of Uttaranachal had been taken by other States and countries, causing loss to the original growers of Basmati rice. A plea was made to create a brand out of Uttaranchal Basmati rice by using the law relating to geographical origin.

ii) There was a need to promote Tapovan Basmati rice which was rare and was a premium product.

iii) There was substantial exploitation of farmers in the markets and up to 10% of Adhat was charged without receipt.
iv) There was an overall shortage, market was harsh without facilities for grading particularly in apple and other horticulture produce. This led to low price while traders made substantial profits by polishing and grading of horticulture produce and marketing in bigger cities.

v) The State Government had proactively helped the farmers for collective bargaining in order to get them better prices for their produce from the traders.

vi) Even though efforts had been made to set up producers markets for farmers to directly market their horticulture produce, there was a need to set up booths managed by farmer cooperatives in bigger cities in order to bridge the gap between the consumers and the producer prices.

vii) There was a need to set up laboratory for ensuring ASTA-CODEX guidelines in order to get premium prices for quality. In general, there was a need to promote quality literacy among the farmers.

viii) Panchayati Raj system was not functioning efficiently and in particular was not taking adequate interest in setting up rural storage godowns by utilizing rural employment guarantee programme funds. The absence of rural guidelines led to lot of wastage and the farmers often had to sell their produce in compulsion at low prices.

11. After the Consultation session, the Members assured the full consideration of the suggestions and written representations made by the State Government and participants. They also thanked the State Government for the courtesy shown.
STATE LEVEL CONSULTATION OF UTTAR PRADESH FOR FEEDBACK ON THE DRAFT NATIONAL POLICY FOR FARMERS AT LUCKNOW ON 4th AUGUST, 2006.

1. Introduction

The Consultation was organized by the National Commission on Farmers (NCF) in collaboration with the State Government at Lucknow on 4th August, 2006. The NCF was represented by Shri Atul Sinha, Member Secretary, Dr. R.B. Singh, Member, Shri Atul Kumar Anjan, Member Part-time and Dr. Ramesh Singh, Research Officer. Farmers, Farmer Organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR Institutions, Bankers, officials of State and other stakeholders participated in the Consultation. The major suggestions/issues raised during the Consultation were as under:-

1.2 Member Secretary welcomed the participants on behalf of NCF and requested them to give their valuable suggestion on the Draft Policy for Farmers circulated by NCF. He also explained salient recommendations of NCF in its four Reports already submitted to Government. Dr. R.B Singh highlighted the problem of soil and water degradation adversely affecting productivity and institutional reforms necessary to tackle the problem. Shri Atul Kumar Anjan mentioned about low investment in agriculture and inadequate response of Scientists and Researchers to various problems of farmers. He suggested early constitution of State Farmers’ Commission.

1.3 Hon’ble Minster Agriculture, U.P in his remarks highlighted the importance of food security, crop diversification and Bhumi Sena Yojana recently formulated by the State Government to improve “Oosar” in order to allot it to landless persons in rural areas and the need for a second Green Revolution and investment, production and supply of quality seed and other inputs. He stressed that improving functioning of KVKs for dissemination of proven technologies to farmers effectively was essential. APC briefly mentioned steps taken by State Government to improve productivity and income of
farmers and stated that State Government had come out with an Agriculture Policy with a Vision Document on 07.02.2006. He further indicated the need to improve marketing opportunities for farmers through retailing and by suitably increasing MSP.

2. General Observations and Suggestions

i) Spray of cow dung plus cow urine by a farmer protected crop from “Neelgai”.

ii) Coverage of agriculture and farmers in media was stated to be very poor.

iii) Compared to defence and other sectors, the budget allocation for agriculture was stated to be lower.

iv) Subsidy should be given directly to farmers.

v) Lot of funds for agriculture lapsed due to procedural difficulties.

vi) Rights of farmers on seed and water should be firmly established in the Policy.

vii) Strict governance to check corruption should be ensured and highlighted in the Policy.

viii) Diesel should be provided to the farmers at subsidized rates.

ix) Adequate drainage facility should be provided to prevent water logging.

3. Land

i) Land was being diverted in U.P from wheat to sugarcane on a large scale and this could affect overall production of wheat.

ii) Average landholding by farmers was reducing due to excessive land acquisition for industries apart from other reasons.

iii) Yield was going down due to soil degradation and incorrect application of fertilizer.

iv) Fertile land should not be diverted for non-agricultural purpose.

v) Planning at National and State Level was needed for desired land use pattern for growing different crops competitively.

vi) Water logged land should be covered under sugarcane cultivation and fisheries.
4. **Water**

i) In irrigated area water supply from head to tail should be ensured by lining of canals which would reduce loss of water.

ii) Government tube-wells were not working in some cases.

iii) Barrage over Yamuna river was needed to provide irrigation facility to a large number of farmers.

iv) Proper utilization of irrigation water should be ensured.

v) Problem of water logging in some parts of State was highlighted. Varieties, which could withstand water logging, should be developed.

vi) More tanks should be dug to conserve water and increase fish production.

vii) Dredging of river and construction check dams should be taken up.

5. **Livestock and Fishery**

i) Animal husbandry gave sustainable income to farmers if properly adopted by them.

ii) Farmers supported concept of para veterinarian to provide necessary extension services for animals.

iii) Fisher farmers were not treated as full farmer. They got electricity at commercial rates.

iv) Recovery of ponds destroyed by land mafias should be taken up by Government.

v) Lease of village ponds for fishery was taking long time due to procedural hassles

vi) Insurance of cattle was not effective. It was difficult to get the claims for insured cattle.

vii) Increased cost of veterinary medicines was highlighted.

viii) Livestock quality in Bundelkhand region of U.P was inferior resulting in lower productivity.

ix) Animals should be protected through “Goshalas”.

x) Animal drawn implements should be popularized and subsidy on same be allowed.
6. **Organic Farming**

i) Through organic farming sugarcane yield in some cases had gone up to 200 mt./ha and recovery increased by 2%.

ii) Vermi compost was beneficial for the farmers.

7. **Inputs**

i) Input costs were stated to be higher compared to the prices in the market for agriculture produce.

ii) Non-availability of quality seed, fertilizer in time was a major constraint.

iii) Irregular supply of electricity to farmers should be avoided.

iv) Since the Private dealers guided the farmers on pesticides, a minimum qualification should be prescribed for these dealers. Agriculture graduates should be appointed as dealers.

v) Some pumps could save electricity up to 40% with the same efficiency for irrigation. Under different Government Schemes such energy efficient pumps should be provided.

vi) Seed Bill was opposed by some farmers.

8. **Training and Extension**

i) Need for a Counsellor in each Embassy to study agricultural practices in different countries was highlighted.

ii) There should be Training Centers for farmers in each Panchayat.

iii) Public research to identify new varieties which could give sustainable income was not satisfactory mainly due to inadequate investment.

iv) Training of farmers at local level particularly for post harvest management and marketing should be organised.
9. **Credit and Insurance**

i) Every crop and every farmer should be covered by insurance with 75% subsidy on premium.

ii) Crop insurance should be at village level instead of block level which was not beneficial to the farmers.

iii) Loaning procedures adopted by Banks were stated to be very complicated for the farmers. Banks decided shops from where they forced farmers to buy accessories at a higher cost.

iv) Numbers of claims for insurance were rejected on flimsy grounds by private insurance companies adversely affecting the farmers.

v) System of Bima Lok Pal was not effective.

vi) Potential Linked Credit Plans prepared by NABARD for each District should be an effective tool for providing credit by Banks.

10. **Market and Infrastructure**

i) MSP should be fixed based on the cost of cultivation.

ii) Full payment for sugarcane should be ensured to farmers.

iii) MSP increased by 10% whereas input costs had gone up by about 100%.

iv) Sugarcane prices should go up at least by Rs. 200/- per M.T to make it remunerative.

v) Marketing problem for sale of Soyabean was highlighted.

vi) Import of food grain at a higher price than the MSP offered to the farmers was pointed out by some participants.

vii) Marketing was identified as a major problem for farmers.

viii) Middlemen as brokers should be eliminated from market.

ix) U.P. Government had not yet agreed to contract farming.

x) Inadequate processing facility available only for about 2% of agriculture produce was highlighted.

xi) Irregular supply of electricity to farmers was creating problem for farmers.

xii) Facility of assured market should be made available to the farmers.
11. Suggestions and observations made by the Honourable Ministers for Agriculture, Cooperation, Fisheries and Animal Husbandry

During discussion with the Members of NCF, the Ministers incharge, Agriculture, Cooperation, Fisheries and Animal Husbandry, Govt. of U.P. gave the following major suggestions on behalf of the State Government on the Draft National Policy for Farmers:

i) Food and livelihood security is the central issue for the Policy. Government of Uttar Pradesh in its Agriculture Policy 2005 had based its strategy on a 7-point Action Plan to ensure food and livelihood security of people.

ii) To implement the concepts like cooperative farming and corporate farming it is necessary to have a strong legal framework with a code of conduct and there should be consultation with the stakeholders before implementation.

iii) Production of hybrid seeds through SHGs is not feasible. Government farms can be utilized for production of quality seeds according to agro climatic conditions in order to fulfill the requirements of the State.

iv) Certification of organic products is essential to promote organic farming.

v) There is a need to delink agriculture credit from land title.

vi) No restriction on export of agriculture produce should be imposed.

vii) State Government has decided to constitute Agriculture Advisory Council.

viii) The soil quality in a large portion of land has deteriorated due to different reasons. In order to make this land cultivable, State Govts. are implementing “Bhumi Seva” Scheme. It would be desirable for Central Govt. to support such schemes through adequate funding.

12. After the Consultation session, the Members assured the full consideration of the suggestions and written representations made by the State Government and participants. They also thanked the State Government for the courtesy shown.
STATE LEVEL CONSULTATION OF WEST BENGAL FOR FEEDBACK ON DRAFT NATIONAL POLICY FOR FARMERS HELD ON 1ST AUGUST, 2006 AT KOLKATA

1. Introduction

The State Consultation of West Bengal organized in collaboration with the Department of Agriculture of the State, was held in Kolkata on August 1, 2006. NCF was represented by Mr. Atul Sinha, Member Secretary, Dr. R B Singh, Member and Ms. R V Bhavani, Director (Tech). Farmers, farmers’ organizations, NGOs, Media Representatives, Scientists from Agriculture Universities and ICAR institutions, Bankers, officials of the State Government and other stakeholders participated in the Consultation.

2. General Observations and Suggestions

The highlights of the suggestions/issues that came up are summarized below:

i) Of late income from agriculture is coming down. As such farmers have started to switch over to other professions and moving to nearby cities. Measures have to be taken to convert farming into a lucrative profession by giving remunerative price for their produce, reducing the cost of inputs and providing necessary infrastructure support and technical guidance.

ii) There should be substantial enhancement in the central budgetary allocation for agriculture because 60% of the population is still dependent on agriculture.

iii) Adoption of appropriate technology by farmers for higher production in different crops, development of food processing and creation of opportunities for large scale use of farm produce in industry need priority attention.

iv) There should be thrust on moving from mono-crop to multiple cropping system; a composite farming systems approach fitting low water requiring crops with improved productivity will help raise production; no land should be left fallow to the extent possible.
v) There is lack of coordination among the departments like Agriculture, Horticulture & Food Processing, Fishery, Animal Husbandry etc. which are responsible for economic wellbeing of farming community. Development of better coordination among line departments is required.

vi) Number of man days in Agricultural activities is coming down every year. High level mechanization is also a reason for this. Measures have to be taken to address this aspect.

vii) We should ensure our own food and nutrition security before we export foodgrains. Export oriented agriculture can be encouraged once this is satisfied and niche markets developed.

viii) Peasants and agricultural labour should automatically come under the BPL list.

ix) Organic agriculture should be made mandatory in hill areas. Certification procedures for organic agriculture should be locally available; Inputs should be subsidised

x) The agro-forestry section in the Policy is well-developed and complete. Other sections should be organized on similar lines.

xi) Fishery issues have not been covered adequately in the policy.

xii) Agriculture has to be incorporated in the school syllabus to give an overview of the activities to the students.

xiii) Measures have to be taken to attract youth to agriculture by developing youth oriented Agriculture. Diversification was mentioned as a good stimulant.

xiv) Selection of crop should be location and demand specific. Intensive cultivation of some specific commercial crops like Tea, Jute & Cotton will help in improving economic condition of the farmers. JCI and CCI should be strengthened to purchase jute and cotton directly from farmers at remunerative price.

xv) Actions have to be taken for drawing up schemes exclusively for small and marginal farmers.

xvi) Cooperative based approach has to be followed in Agriculture which will minimize production cost and increase productivity.
Rural entrepreneurship development is very essential for economic improvement of farming community

Animal Husbandry also has to be given due importance along with Agriculture. This will help in augmenting farm income.

Specialised personalities are very often honoured by the Government for their extraordinary contributions to the nation. Likewise farmers contributing to Agriculture with their innovative ideas have to be honoured by the Government. This will drive the farmers in doing a lot for Agriculture which will in turn increase production and productivity of different crops.

A Farmers’ ITK Board maybe formed to collect and document all effective ITK;

PDS should be universalized and there should be transparency in governance and implementation.

A large number of Government sponsored projects are lying unfinished, resulting in wastage of resources and blocking of future projects.

Only professionals should be made Directors of technical departments, viz. Director Agriculture/Fisheries/Horticulture.

Agriculture should be brought into the Concurrent List.

NREGP should be extended to all districts of the country.

Small farmers under debt are selling their land and becoming landless labourers.

3. Land

Suitable crop planning is needed to combat the agro climatic stress. Lot of land suffering from acidity needs special treatment and cropping pattern.

The soil of Jalpaiguri district is very light and acidic. Nutrient and water holding capacity is also very poor and as a result yield is low. Soil Health improvement and water retention need attention.

More emphasis should be given on land reform. Though the Left Front Government has given a major thrust to land reforms, more impetus should be given on this prime issue. The impact of Operation Barga has to be reviewed and unfinished tasks completed, like distributing land to landless.
iv) In rainfed farming areas, rainwater holding agro forestry should be promoted.

v) Encroachment on agricultural land by different sectors is also a major threat to Agriculture. Therefore, availability of net cultivable area needs to be worked out in proportion to targeted population keeping in mind the question of food security.

vi) Fragmentation of land is a growing problem. Consolidation through community approach is the need today.

vii) Decisions should be made in advance on how much land should be under high value crops.

viii) Wasteland should be distributed among the landless labourers (one bigha per landless).

ix) Extreme shortage of DAP is causing nutrient imbalance.

4. Water

i) Purulia, a drought prone district with red laterite soil and extreme climate, needs intensive development of rain water harvest structures to boost agricultural production.

ii) Salinity and availability of sweet water is a major problem in South 24 Parganas district which limits the production potential and enables only a single crop.

iii) In some areas, lack of irrigation facility for Rabi crop and Boro Rice is the main problem of harvesting good yield.

iv) Inadequate supply of irrigation water from Tista Barrage Project is a problem for Jalpaiguri farmers. Adequate irrigation water from the State project is to be ensured to increase productivity and cropping intensity.

v) Surface water bodies should be revived and renovated; Problem of arsenic in groundwater has to be addressed urgently

vi) Water, the key input in Agriculture is being polluted by different companies. Thus quality of irrigation water as well as drinking water has been deteriorating, especially affecting downstream farmers. This has to be stopped and such
companies have to be taxed. The fund so accrued has to be utilized for development of farming community.

vii) Modern projects are neglecting and even destroying existing and or traditional drainage systems.

viii) There should be an Emergency Fund to meet out relief to crops damaged by untimely water release from dams.

ix) Micro power generation should be permitted to run motors for irrigation.

x) Down drawing of water from dam hampers production of fish as it generally coincides with the breeding season of fish.

xi) Rivers have a life of their own and river linking programmes should be stopped.

xii) Decentralised, district micro-level water use planning is needed with integrated watershed based approach

5. **Inputs**

i) Production suffers from non-availability of good quality seed and fertilizer and their timely supply. Networking with good NGOs can help solve this problem.

ii) Quality seed should be made available by improving the functioning of Government farms.

iii) Economic status of farming community particularly of the small and marginal farmers is not in good shape. Proper subsidy should be given to them for supply of quality agricultural inputs - quality seeds, fertilizer, irrigation pesticides etc.

iv) Seeds of salt tolerant paddy variety should be provided to farmers along the coast.

v) More emphasis should be given on promoting oilseed cultivation, particularly sunflower.

vi) Government Inspectors should enhance their vigil regarding spurious inputs like seeds.

vii) The policy does not say anything on GM seeds. They should not be allowed.
viii) The Seed Corporation of India should be revitalized to supply to small and marginal farmers.

ix) MNC seed players should not be allowed.

x) The Seed Bill should be reviewed carefully and be in tandem with the already existing PPVFR and Biodiversity Acts and protect farmers’ interest.

6. Technology and Training

i) There should be monthly meetings of the agriculture department with farmers at the block level.

ii) The work of agriculture universities and research institutions is not reaching the farmers.

iii) Production of vegetables through organic farming fetches higher price. Therefore greater awareness should be generated on organic farming.

iv) Knowledge gap to tackle the soil and crop health through use of balanced nutrient and proper crop management has to be addressed.

v) Soil testing service should be available at the village level and at all KVKs.

vi) Emphasis has to be given on application of IT in agriculture.

vii) Farmers need training in composite farming techniques. There should be Zonal Farmer Training Centres.

viii) KVKs should be tapped for educating our farmers.

ix) Each district should have at least one soil testing laboratory. This is very vital because of the fact that research studies show that due to application of chemical fertilizers the health of soil deteriorates.

x) There should be district-level agro-meteorology stations. This will help farmers in drawing their seasonal cropping programme in a comprehensive manner.

xi) Often R & D work is carried in the field of farmers by the MNCs. Tax has to be imposed on such works.

xii) Participatory research should be supported.
7. Credit and Insurance

i) Institutional crop loan is not available to many. The outreach of the formal credit system has to be increased.

ii) The Kisan Credit Card is cornered by the big farmers and is beyond the reach of the small and marginal farmers.

iii) Crop Insurance can be a prime risk aversion type measure in the era of cost intensive modern agriculture; it should cover all crops and be available across the State. But what seems to be the main hurdle to this way is the Unit area for compensation i.e. Block as defined under the existing crop insurance programme. The village should be the unit of assessment. Also, 60% damage should be sufficient ground for compensation and the government should bear the premium burden.

iv) Crop insurance should cover all crops.

v) Why can’t insurance be individual farmer based?

vi) Small and marginal farmers should get interest free credit through credit cards.

8. Price and Market

i) Marketing produce at remunerative price is a problem. The price is there but does not accrue to the farmer because of the chain of intermediaries. Price accruing to the farmer should include the profit component.

ii) Vegetables storage facility for unsold vegetables is lacking. There should be cold storages for crops like potato.

iii) More emphasis should be given to export oriented agriculture.

iv) Fixation of MSP of agricultural commodities is not always reasonable. Rational fixation of price of all the agricultural commodities is urgently required.

v) Proper road infrastructure is important to reach the market.

vi) Our farmers are not equipped to deal with Corporate Farming and Contract Farming. Local NGO of credibility may be involved to ensure that the farmer is not cheated. PRIs can take the initiative in backing PPP model with technical backup from the University. With proper support, contract farming is perhaps
the direction to take in view of the small size of land holdings and the need for assured price for produce. Government should be made a party in the contract as the third party, primarily for dispute settlement.

vii) There should be thrust on food processing and Food Parks maybe promoted. Creation of food parks will inspire the farmers in producing agricultural commodities of extra good quality and they will also get good price of their products.

viii) The regulated markets are controlled by a few wholesalers. They should be brought under control and competition increased.

ix) Farmers should get scope for direct sale in the market; eliminate middlemen.

tax) MSP for fish is not applicable.

xi) Farmers in many States are committing suicide mostly on account of non-receipt of remunerative price of their commodities.

xii) Cost of production of Agricultural commodities varies from district to district. Therefore, different procurement prices have to be declared for different districts. In general, inputs cost has been rising fast whereas output prices remain depressed.

9. **Women in Agriculture**

i) Appropriate measures should be prescribed in the policy for economic uplift of women farmers.

ii) Women should be called to meetings. They need special counseling and training

iii) There should be equal pay for equal work and no discrimination in wage rates to male and female wage labour

iv) Kisan Credit Card should be given in the wife’s name instead of the husband.

10. **Information Dissemination**

i) Information on various extant Government programmes and schemes do not reach the farmers. These are generally cornered by the big farmers.

ii) Agricultural news should be broadcast on regular basis through radio. It would be ideal if there were a separate channel for agriculture and farmers.
iii) Success stories of farmers should be telecast/broadcast.

iv) Interactive Programmes should be increased – farmers should be able to phone-in for advice, write with their queries.

v) KVKs should be given license for radio transmission, like the KVK Baramati model.

vi) Agriculture Internet outlets like E-choupal, E-Agriculture should be opened immediately for facilitating our farmers so that they can access information for fetching remunerative price.

vii) Media should be well equipped and have to come in the forefront for the interest of our farmers.

viii) Weather forecasting system should be more elaborate and accurate for ensuring our farmers have access to them through internet and mass-media.

ix) All possible and effective means of information should be harnessed and effectively utilized, e.g. street plays, community newsletter, Jatra group.

x) A large number of information centres should be opened in West Bengal from where the poor farmers will get the correct message and information for their cultivation.

xi) Model farmer in each block maybe identified and trained to disseminate information and train others.

xii) Grassroot workers and NGOs should be trained on aspects relating to IPR, WTO, BD and PPVFR Acts and they in turn have to disseminate the information to further reach out to farmers. Officials should also have clear idea about the process of patenting.

xiii) Important days like Wetlands Day (June 16), Fish Farmers’ Day, should be observed in each Block to generate greater awareness.

xiv) Setting up of farmers’ schools is essential to disseminate recent know how in farming, creation of extensive facilities for monitoring soil health, generating awareness to minimize dependence on plan protection chemicals to save the health of human, development of Agri-based industry to ensure remunerative prices for the farm produce.
xv) Formation of farmers’ club can help easy dissemination of agricultural technologies among farmers.

xvi) Present extension method followed in agriculture is not sufficient enough for quick dissemination of Agricultural technologies. Measures have to be taken to this effect with the process of involving NGOs or any other private extension agencies.

11. Suggestions from Ministers

After the consultation, the NCF representatives had a discussion with the Ministers of Agriculture, Animal Husbandry, Agriculture Marketing and Fisheries and the concerned officials of these Departments. The Ministers apprised the members about the steps taken by the State Government in favour of farmers and raised various issues relating to the State that needed the attention of the NCF.

The issues and suggestions that came up are summarised below:

i) **Fisheries**: There should be insurance schemes for fisheries also; there is ban on import of brood stock. This has to be reviewed and relaxed on case by case basis, like in the case of certain varieties of ornamental fish. In the entire cycle of breeding-feeding-healthcare-management, a pro-poor approach is needed. There should be a policy based on latest knowledge and assessment of future threats.

ii) **Livestock**: only cattle and poultry have got attention in the Policy. There is no coverage of mulberry; There has to be Livestock Mapping on the lines of Crop Mapping;

iii) There should be 100% insurance for all animals;

iv) There should be KVK exclusively for livestock in each district;

v) There is need for Local Breeding and Feeding Policy; One goat needs on an average 5 cottah of grazing land and a cow requires 10 cottah Low cost production of fodder and feed for animal husbandry has to be promoted;

vi) Breeding of indigenous breed of quality livestock has to be promoted;
vii) Medical care for animals is sparse. There should be two-year para-veterinary courses to setup and man PHCs for animal healthcare; SHG members in villages can also be trained; There is an ongoing scheme of ‘Prani Bandhu’in every Gram Panchayat, the person collects Rs.60/- for every artificial insemination done;

viii) Although export of cattle and beef is banned, there is illegal trade through Bangladesh. This has to be reviewed and a policy beneficial to protect the interests of our livestock rearers put in place.

ix) **Inputs:** Seed multiplication is required on a large scale. Hybrid seed production should be encouraged with atleast 60% subsidy; Organic farming inputs like green manure need subsidy support

x) There should be effective implementation of land reforms across the country to improve the standard of living of the farmer

xi) Agriclinics and Agribusiness Centres have to be promoted; Thrust on small scale cottage and agro-based industries is needed

xii) There should be Pension and PF provision for farmers also. West Bengal Government has introduced a pension scheme

xiii) Contract farming should have protection for small farmers; The terms and conditions should be favorable; Composite Farming with backward and forward linkages and coordination between different sectors should be encouraged

12. The Members assured the full consideration of the representations made by the State Government and all the participants. They also thanked the State Government for the courtesy shown.
ACKNOWLEDGMENTS

The National Commission on Farmers expressed its gratitude to the Hon’ble Union Minister for Agriculture, Food, Public Distribution and Consumer Affairs, Shri Sharad Pawar, for having taken keen interest in the work of the Commission and for providing overall guidance to its activities. Thanks are also due to the Planning Commission and Ministers for Finance, Rural Development and Panchayati Raj for their valuable suggestions.

The National Commission on Farmers would like to sincerely thank the Chief Ministers of various States and their Ministers for their valuable suggestions. Sincere thanks are also due to the senior Officers of the State Governments for the courtesies shown to the NCF teams and for organizing the interaction with farmers and other stakeholders in the States.

NCF is grateful to Shrimati Sonia Gandhi, former Chairperson and other members of the National Advisory Council, for the opportunity given for presenting the Recommendation of the NCF to NAC.

The Commission would also, in particular, like to thank Shrimati Radha Singh, Secretary, Department of Agriculture & Cooperation, Govt. of India, for assisting the Commission at all stages and making it possible for the Commission to complete its work well within the time allotted to it. The support coming from her senior Officers including Joint Secretary (Policy) in the Department of Agriculture & Cooperation is also gratefully acknowledged. Thanks are due to the various Ministries of the Govt. of India and the National Commission for Women for valuable suggestions.

The entire National Agriculture Research System has actively contributed to the deliberations of the Commission and enriched the quality of its work. Vice Chancellors of the Universities for Agriculture, Animal Husbandry and Fisheries deserve all praise for their support. Private sector R&D institutions have also provided excellent inputs which are appreciated. The National Commission on Farmers is indebted to a large number of
farmers, farmers’ organizations, leaders of political parties, NGOs and individuals for their advice and suggestions, both verbally and in writing. The Commission expresses its sincere thanks to the National Academy of Agricultural Sciences (NAAS) for providing logistical support.

NCF acknowledges the valuable technical contributions by Shri S.S. Prasad, and Shri G.C. Pati, former and present Joint Secretary, Ms Mamta Shankar, Director, Ms R.V. Bhavani, OSD to Chairman and Research Officers: Dr.(Ms.) Laxmi Joshi, Dr. Deepak Rathi, Dr. Pavan Kumar Singh, Dr. Ramesh Singh and the sincere work of Research Assistant, Dr. Prabhu Dayal Chaudhary and the secretarial staff of the Commission in the preparation of the Revised Draft National Policy for Farmers.
